HOUSE, *habitatio*; a place built with conveniencies to live in; or a building wherein to ſhelter a man's perſon and goods from the inclemencies of the weather, and the injuries of ill-diſpoſed perſons.

We ſay a brick *houſe*, a ſtone *houſe*, a *houſe* of two ſtories, of three ſtories, a manor *houſe*, a farm *houſe*, &c.

Ancient Rome conſiſted of forty-eight thouſand *houſes*, all inſulated or detached from one another.

For the number of *houſes*, and of inhabitants to a *houſe* in England, &c. ſee the article EXPECTATION *of life*.

A pleaſure *houſe*, or country *houſe*, is that built for a perſon to enjoy and divert himſelf occaſionally in. This is the *villa* of the ancient Romans; and what in Spain and Portugal they call *quinta*; in Provence, *caſſine*; in ſome other parts of France, *gloriette*; in Italy, *vigna*.

The word *vigna* is itſelf ſometimes uſed in Engliſh to denote the country-ſeats of the noble Romans; as the *vigna Farneſe, vigna Borgheſe*, &c.

The citizens of Paris have alſo their *maiſons de bouteillat, bottle-houſes*, to retire to, and entertain their friends; which in Latin might be called *mæ*; the emperor Domitian having a *houſe* built for the like purpoſe, mentioned under this name by Martial, lib. ii. ep. 59.

It is a thing principally to be aimed at, in the ſite or ſituation of a country *houſe*, or ſeat, that it have wood and water near it. If it cannot conveniently be built among trees, yet there are few places where trees may not be ſpeedily raiſed about it.

It is far better to have a *houſe* defended by trees than hills; for trees yield a cooling, refreſhing, ſweet, and healthy AIR and ſhade, during the heat of the ſummer, and very much break the cold winds and tempeſts, from every point in the winter. The hills, according as they are ſituated, defend only from ſome certain winds; and if they are on the north ſide of the *houſe*, as they defend from the cold air in the winter, ſo they alſo deprive you of the cold refreſhing breezes, which are commonly blown from thence in the ſummer. And if the hills are ſituate on the ſouth ſide, they then prove alſo very inconvenient.

A *houſe* ſhould not be too low ſeated, ſince this precludes the convenience of cellars. If you cannot avoid building on low grounds, ſet the firſt floor above the ground the higher, to ſupply what you want to ſink in your cellar in the ground; for in ſuch low and moiſt grounds, it conduces much to the drineſs and healthineſs of the air to have cellars under the *houſe*, ſo that the floors be good and ſtoned underneath. *Houſes* built too high, in places obvious to the winds, and not well defended by hills or trees, require more materials to build them, and more alſo of reparations to maintain them; and they are not ſo commodious to the inhabitants as the lower-built *houſes*, which may be built at a much eaſier rate, and alſo as complete and beautiful as the other.

In buildings, or *houſes* not above two ſtories with the ground-room, and not exceeding twenty feet to the raiſon-place, and upon a good foundation, the length of two bricks, or eighteen inches for the heading courſe, will be ſufficient for the ground-work of any common ſtructure, and ſix or ſeven courſes above the earth to a water-table, where the thickneſs of the walls is abated, or taken in, on either ſide the thickneſs of a brick, namely, two inches and a quarter.

For large and high *houſes*, or buildings, of three, four, or five ſtories with the garrets, the walls of ſuch edifices ought to be from the foundation to the firſt water-table three heading courſes of brick, or twenty-eight inches at leaſt; and at every ſtory a water-table, or taking in on the inſide for the ſummers, girders, and joints, to reſt upon, laid into the middle, or one quarter of the wall at leaſt, for the better bond. But as for the innermoſt or partition-wall, a half brick will be ſufficiently thick; and for the upper ſtories, nine inches, or a brick length, will ſuffice.

The parts, proportions, &c. of the *houſes* in London, are regulated by ſtatute. See BUILDING, and article FIRE-*ocks*.

Every man has a right to air and light in his own *houſe*; and therefore if any thing of an infectious ſmell be laid near the *houſe* of another, or his lights be ſtopped up and

darkened by buildings, &c. they are nuisances punishable by our laws; but no action lies for merely obstructing the opening of a prospect. If a man's *house* be attacked with intent to kill, and the owner or his servants kill the thieves in defending him and his *house*, this is not felony, and incurs no forfeiture. One man may compel another to repair his *house* in several cases, by the writ *de domo reparando*. The doors of a house may not be broken open on arrests, except in cases of treason or felony, &c. The riotously pulling down of a *house* is felony, excluded clergy. Stealing lead, or iron bars, or rails fixed to *houses*, &c. is felony punishable by transportation, by 4 Geo. cap. 32. The hundred is liable to damages by the burning of *houses*. 9 Geo. cap. 32. See ARSON, BURGLARY, &c.

HOUSE, *hot.* See HOT and STOVE.

HOUSE, *green.* See GREEN.

HOUSE, *ice.* See ICE.

HOUSE, *summer*, a little edifice erected at the corner of a garden, and contrived to let in so let air in on all sides; or to exclude it, as you find proper.

HOUSE, *town*, or *hall*, is a place where the officers and magistrates of a town or city hold their meetings, for the due administration of their laws and policy. See HALL and GUILD.

HOUSE, *work*. See WORK-*house* and BRIDEWELL. See also the article RASPHUYS.

HOUSE *of correction*. Justices of the peace in their quarter-sessions are to make orders for erecting *houses of correction*, and for the maintenance and government of the same, and for the punishment of offenders committed thither. 30 Eliz. cap. 4. 17 Geo. II. cap. 5. In every county of England there shall be a *house of correction*, built at the charge of the county, with all conveniencies for the setting of people to work, or every justice shall forfeit 5*l.* And the justices in sessions are to appoint governors or masters of such *houses of correction*, and their salaries, &c. which are to be paid quarterly out of the county stock. These governors are to set the persons sent on work, and moderately to correct them, by whipping, &c. and to yield a true account every quarter-sessions of persons committed to their custodies; and if they suffer any to escape, the justices may fine them. 7 Jac. I. cap. 4. 12 Geo. II. cap. 29.

The *house of correction* is for the punishing of idle and disorderly persons, parents of bastard children, beggars, servants running away, trespassers, rogues, vagabonds, &c. Poor persons refusing to work, are there to be whipped, and set to work and labour; and any person who lives extravagantly, having no visible way to support himself, may be sent to the *house of correction*, and set to work there, and may be kept there, until he gives the justice satisfaction in respect to his living, but not to be whipped. A person ought to be convicted of vagrancy, &c. before he is ordered to be whipped.

BRIDEWELL is a prison for correction in London, and offenders may be sent thither.

HOUSE is also used for a convent or monastery.

Regular priests give the name *house* to the places they reside in, and not that of convents or monasteries, which properly belong to simple friers. Thus we say, the *Jesuits house*, and the *Barnabites* or *Theatins house*.

The Jesuits have both professed *houses*, and colleges for novices, which they call *houses of probation*.

They have also *houses of retreat* for spiritual exercises, where they receive secular persons and ecclesiastics, disposed to practise the same with them for eight or ten days.

HOUSE is also used for one of the estates of the kingdom assembled in parliament.

Thus we say, the *house* of lords, the *house* of commons, &c. See COMMONS, PARLIAMENT, and PEERS.

HOUSE is also used for a noble family; or a race of illustrious persons issued from the same stock. See GENEALOGY.

In this sense we say, the *house* or family of the Stuarts, the *house* of Bourbon, the *house* of Hanover, of Austria, of Lorrain, of Savoy, &c.

HOUSE, in *Astrology*, a DODECATEMORY, or twelfth part of the heavens.

The division of the heavens into *houses* is founded on this, that the stars and planets, when found herein, are supposed to have certain influences, either good or evil, upon sublunary bodies; and to each *house* is assigned its particular virtue or influence, upon the consideration whereof they draw HOROSCOPES.

This division is made by six great circles, called *circles of position*, which cut each other in the common intersection of the meridian and horizon, in the ordinary way of dominifying, which is that of Regiomontanus; for the ancients and three other ways.

These circles divide the equator into twelve equal parts, of thirty degrees each, without any regard to the zodiac. The horizon and meridian are two circles of the celestial *houses*, which divide the heavens into four equal parts, each whereof comprehends three *houses*. There are six above the horizon, and as many below it; and six eastern and six western *houses*.

The scheme or figure of the heavens consists of twelve triangles, which are likewise called *houses*; wherein are laid down the stars, signs, and planets, comprised within the respective spaces of the circles of position.

Each planet has two certain *houses*, wherein they say it exerts itself with peculiar vigour. Leo is the sun's *house*, and Cancer that of the moon; Capricorn is Saturn's, &c.

Some call the *houses*, *dodecatemories*; but that name is more immediately appropriated to the twelve *signs* or divisions of the zodiac. See DODECATEMORY.

The astrological *houses* have their particular names according to their qualities. The first is the *house of life*, being the ascendant, and containing five degrees above the horizon, the rest beneath it; the second is the *house of riches*; the third, the *house of brothers*; the fourth, in the lowest part of heaven, the *house of relations*, and the angle of the earth; the fifth, the *house of children*; the sixth, the *house of health*; the seventh, the *house of marriage*, and the angle of the west; the eighth, the *house of death*, and upper gate; the ninth, the *house of piety*; the tenth, the *house of honour*; the eleventh, the *house of friends*; and the twelfth, the *house of enemies*.

It is commonly, but as it were poetically, said, that the sun has twelve *houses*, by which are meant the twelve signs, though in reality, it has only one sign, viz. Leo: besides, the division of *houses* is accommodated to the equator, and not the zodiac.

They begin numbering the *houses* with the ascendant, and pass them to the nadir ones; so that the vertical point makes the beginning of the tenth.

HOUSES, *differences of*, in *Heraldry*. See DIFFERENCES.

HOUSE-*bote*, *Estovers*, in *Law*, or an allowance of timber out of the lord's wood, for the repair and upholding a *house*, or tenement.

Some make *house-bote* two-fold, viz. *Estoverium ædificandi & ardendi*. See ESTOVERS.

HOUSE-*breaking*, or HOUSE-*robbing*, the robbing or plundering a man in some part of his *house*, as his booth or stall, in a fair or market; the owner, or his wife, children, or servants, being within the same.

This was made felony by stat. 23 Hen. VIII. and 3 Ed. VI. but it is since also made felony, though done be within the *house*, 26 Eliz. See BURGLARY, and LARCENY.

HOUSE-*burning*. See ARSON.

HOUSE-*painter*. See PAINTER.

HOUSE-*sun*. See WINDOW.

HOUSE-*wife's cloth*, is a middle sort of linen cloth between fine and coarse, for the family use.

HOUSED *in*, in *Ship-building*. The seamen say of a ship, which, after the breadth of her bearing is brought in too narrow to her upper-works, that she is *housed in*, or pinched in too much.

HOUSED is also applied to the situations of the great guns of a ship, which they are secured to sea by their tackles and breechings.

HOUSEL, in the *Manege*. See HOUSING.

HOUSELEEK, *Sempervivum*, in *Botany*, a genus of the *dodecandria decagynia* class. Its characters are these: the flower has a concave empalement, cut into many acute segments; it has ten oblong, spear-shaped, pointed petals, and twelve or more narrow awl-shaped stamina, terminated by roundish summits; it has twelve germina placed circularly, sitting upon so many styles, which spread out, and are crowned by acute stigmas; the germina afterward become so many short, compressed capsules, pointed on the outside, and open on the inside, filled with small seeds. There are seven species.

The common large *houseleek* is seen in every part of England, growing on the tops of houses and walls, and is easily planted by off-sets, which they put out in plenty. If these are planted in mud or flitting earth, on a building or old wall, they will thrive without farther care. Miller.

Houseleek is cooling and restringent; and though not often given inwardly, is commended by some as good to quench thirst in fevers, mixed with purslain seeds, and for heat and sharpness of urine. Prevotius, in his medicinæ Pauperum, commends an equal quantity of the three ounces of the juice of this, and Persicaria [illegible] lata, boiled to the consumption of a third [illegible] given in drink as a certain medicine to stop [illegible] and bloody flux. Outwardly it is useful against [illegible] and scalds, St. Anthony's fire, and the shingles.

HOUSELEEK, *lesser*. See SEDUM.

HOUSELEEK, *small annual*. See TILLEA.

HOUSE-

HODSALLEEK, *water, of Egypt.* See PASTIA.

HOUSHOLD, the family or domeſtics of a prince, or private perſon.

The civil government of the king's court belongs chiefly to the lord-ſteward of the *houſhold*, who has an annual ſalary of 1200*l.* He has authority over all officers and ſervants of the king's houſe, except thoſe of the chapel, chamber, and ſtable, who are under the juriſdiction of the lord-chamberlain, maſter of the horſe, and dean of the chapel.

Under the lord-ſteward are a treaſurer of the *houſhold*, whoſe place is 1200*l.* a year; comptroller, with the ſame ſalary; cofferer, with 500*l.* a year; deputy cofferer; maſter of the *houſhold*, clerks of the green cloth, clerks-comptrollers, &c.

The troops of the *houſhold* are the *horſe-*GUARDS, *horſe-*GRENADIERS, and *foot-*GUARDS. The *houſhold* troops of France are called the GENDARMERIE.

HOUSHOLD *days* are thoſe ſolemn feſtivals in the year, when the king, after divine ſervice, offers a PEZANT of gold to God on the altar.

The *houſhold days* are Chriſtmas, Eaſter, Whitſunday, and All Saints.

The *houſhold days* are a part of the twelve collar and offering days.

HOUSING, or HOUSE, a cover laid over the ſaddle of a horſe, in order to ſave it from the weather, dirt, &c.

The word is formed of the French *houſſe*, which ſignifies the ſame thing; though it anciently denoted a kind of *boots*, worn by country people.

The cavaliers appeared with their embroidered *houſſings*.

HOUSING, *foot*, is a piece of ſtuff faſtened to the hinder part of the ſaddle, that covers a horſe's croupe; either for the ſake of ornament, to hide the horſe's leanneſs, or to ſave the cloaths of the rider from being daubed and ſoiled by the ſweat of the horſe.

HOUSING, *fore*, is a piece of cloth bordered with a fringe, oftentimes put round the ſaddle, to cover the croupe, and hang down to the lower part of the belly, to ſave the ſtockings of thoſe who ride without boots.

HOUSING, among *brickmakers*, a term uſed for a brick which is warped, or is call crooked or hollow in burning; in ſuch a caſe, they ſay it is *houſing*.

HOUSLING, or HOUSELLING, in *Sea-Language*, denotes a ſmall line formed of three nine ſtrands or twiſts of hemp, ſmaller than rope-yarn. It is chiefly uſed to ſeize blocks into their ſtraps, to bind the corners of the ſails, or to faſten the bottom of a ſail to its BOLT-ROPE, &c.

HOUSTONIA, in the Linnæan ſyſtem of *Botany*, the name of a plant called *parnaſſiæ affinis* by Moriſon and ſome others. This makes alſo a diſtinct genus of plants of the *tetrandria monogynia* claſs; the characters of which are, that the calyx is an extremely ſmall erect perianthium, divided into four ſegments, and remaining after the flower is fallen; the flower conſiſts of one petal, in the ſhape of a funnel, with a long cylindric tube, and an open mouth divided into four ſegments, which are roundiſh at their ends; the ſtamina are four extremely ſmall filaments, ſituated in the neck of the flower; the antheræ are ſimple; the germen of the piſtillum is roundiſh and ſtarred; the ſtyle is ſingle, and ſhorter than the ſtamina; and the ſtigma bifid and acute; the fruit is a roundiſh double capſule, containing two cells, with two valves; the ſeeds are ſingle, and the valves placed oppoſite to the partition of the cells. There are two ſpecies.

HOWITZES, in *Artillery*, are a kind of mortars, of German invention, which are mounted upon carriages like traveling gun-carriages, and have their trunnions placed nearly in the middle. The conſtruction of *howitzes* is as various as that of MORTARS, excepting the chambers, which are all cylindric. They are diſtinguiſhed by the diameter of the bore; e. g. a ten-inch *howitz* is that, the diameter of which is ten inches. *Howitzes* are capable of doing great execution, by firing ſhells and grapes of ſhot, in a ſiege where the diſtance is ſmall, and in the field, if they were placed in the flanks, or between the battalions. They are alſo more eaſily carried from one place to another than mortars. For the dimenſions of different *howitzes*, and remarks on their conſtruction, the reader may conſult Muller's Treatiſe of Artillery, part iii. p. 116, &c. See *Tab.* II. *Gunnery, fig.* 11. in which AE repreſents the firſt reinforce, EF the ſecond, F Gethe chaſe, GH the muzzle, I the button, KK the trunnions. The other parts are the ſame as thoſe of the CANNON and MORTARS.

HOWKER, or HOOKER, a veſſel much uſed by the Dutch; built ſomething like a pink, but rigged and maſted like a boy.

Howkers carry from fifty to two hundred ton; and with a ſmall number of hands will go to the Eaſt Indies. They are commonly navigated with two maſts, viz. a main-maſt and a mizen-maſt. They tack ſoon and ſtart, will ſail well, and lie near the wind, and live almoſt in any ſea.

HOWLE, in *Ship-Building*. When the foot-hooks of a ſhip are ſcarfed into the ground-timbers, and bolted, and then the plank laid on them up to the clefap, the carpenters ſay, they begin to make the *ſhip howle*.

HOY, a ſmall veſſel or boat, uſually rigged like a ſloop, and employed for carrying paſſengers and luggage from one place to another, particularly on the ſea-coaſt. In Holland the *hoy* has two maſts; in England it has but one, when the main-ſail is ſometimes exceeded by a boom, and ſometimes without it.

HOYACHU, in *Botany*, the name given by the Chineſe to the ALACIA-*tree*. They make great uſe of this tree in arts and medicine. They have a way of ſtaining a fine yellow upon paper with its flowers; and they give the ſeeds in ſeveral diſeaſes, in ſome of which, as in the dyſentery and hæmorrhages, they are of great ſervice. But, beſide theſe, they make an odd medicine of them, which they take with great readineſs for purpoſes it can never anſwer. They pick out the ſeeds carefully from the pods, as ſoon as ripe; they put theſe into a flat veſſel, and cover them with ox's gall; this is to be ſet for a hundred days to dry, in a place where the ſun does not come; after this, one of theſe ſeeds is to be ſwallowed every day before the firſt meal; and, by continuing this a proper time, they ſay the eye-ſight, if loſt, is reſtored, and their grey hairs become black. Obſerv. ſur les Coûtumes de l'Aſie, p. 246.

HOZING *of ships*, the cutting out the balls of their feet. See EXPEDITATION.

HUGARI, in *Natural Hiſtory* the name of a bird very often mentioned by the Arabian authors. It is deſcribed to be a bird ſomewhat larger than a gooſe, having very ſhort wings in proportion to its body, ſo that it cannot fly well, and therefore affording great ſport to the Syrian hunters. It is ſaid to be common about Damaſcus. By this place of its frequenting, and by the deſcription, it appears to be the BUSTARD; that bird being very plentifully found about Damaſcus, and being hunted with ſwift dogs on the ſandy plains throughout.

HUCK, in *Hydrography*, a name uſed by ſome authors for the German river-nymph. In moſt reſembles the common river-trout in ſhape; but is covered all over the back with innumerable black ſpots; the ſides are red, and have alſo ſome black ſpots, though they are not very numerous, on them; the under-jaw has alſo ſome ſpots, but there are none on any other part of the head; the fins are red, and it differs from the common trout in having no teeth on the middle of its palate; it alſo grows to a much larger ſize than our trout, and has none of the red ſpots which are ſo plentiful on that fiſh.

HUCKABACK, in *Commerce*, is a kind of linen, on which the figures are raiſed.

HUCKLE-*bone*, the hip-bone. See COXA.

HUCKSTER, one that ſells proviſions or ſmall wares by retail.

HUDSON'S BAY *Company*. See COMPANY.

HUDSON'S *Bay Porcupine*. See PORCUPINE.

HUDSONIA, in *Botany*, a genus of the *dodecandria monogynia* claſs. Its characters are, that it has no corolla, a five-leaved tubulous calyx, fifteen ſtamina, and a ſingle-celled three-valved capſule, containing three ſeeds.

HUE-AND-CRY, derived from the French *huer* and *crier*, which both ſignify *to ſhout, or cry aloud*, denotes the purſuit of one who has committed felony, &c. on the highway.

If a party robbed, or any in the company of one murdered or robbed, come to the conſtable of the next town, and require him to raiſe *hue-and-cry*, or to purſue the offender, deſcribing him, and the way, as near as he can, which way he is gone, the conſtable is forthwith to call for aid from the parith to ſeek the felon; and if he is not found there, he is to give the next conſtable warning, till he be apprehended, or at leaſt purſued to the ſea-ſide.

The Normans had a purſuit with a cry after offenders, not unlike this; which they called *clamor de hare*. See CLAMOR.

Hue is alſo uſed alone, ann. 1 Edw. I. ſtat. 2. In ancient records it is called *hutſium & clamour*, which properly ſignifies a purſuit by horn and by voice.

This proceſs of purſuing is mentioned by ſtatute Weſtm. 1. 3 Edw. I. cap. 9. & 4 Edw. I. *de officio coronatoris*. But the principal ſtatute relative to this matter is that of Wincheſter, 13 Edw. I. cap. 1. & 4. which directs that from thenceforth every county ſhall be ſo well kept, that immediately upon robberies and felonies committed, freſh ſuit ſhall be made from town to town, and from county to county; and that *hue-and-cry* ſhall be raiſed upon the felons, and they who keep the town ſhall follow

with

with *hue-and-cry*, with all the town and towns near; and *so hue-and-cry* ſhall be made from town to town, until they be taken and delivered to the ſheriff. And that ſuch *hue-and-cry* may more effectually be made, the hundred is bound by the ſame ſtatute, cap. 7. to anſwer for all robberies therein committed, unleſs they take the felon, which is the foundation of an action againſt the hundred, in caſe of any loſs by robbery. By ſtat. 27 Eliz. cap. 13. no *hue-and-cry* is ſufficient, unleſs made with both horſemen and footmen. And by ſtat. 8 Geo. II. cap. 16. the conſtable or like officer refuſing or neglecting to make *hue-and-cry*, forfeits 5*l.* and the whole vill or diſtrict is ſtill in ſtrictneſs liable to be amerced, according to the law of Alfred, if any felony be committed therein, and the felon eſcape. *Hue and-cry* may be raiſed either by precept of a juſtice of the peace, or by a peace-officer, or by any private man that knows of a felony. But if a man maliciouſly or wantonly raiſes a *hue-and-cry*, without cauſe, he ſhall be ſeverely puniſhed as a diſturber of the public peace. Blackſt. Comm. vol. iv. p. 290, &c. See HIGHWAYMEN.

In ſupplement to this ancient eſtabliſhment, ſir John Fielding's plan was inſtituted for the diſcovery of offenders, after they have eſcaped the freſh purſuit upon *hue-and-cry*, by ſending immediate notice to a certain known office in London, from whence are iſſued weekly accounts to every part of the kingdom, deſcribing the offence and the offender with as much accuracy as the caſe will admit. By theſe means many notorious offenders have been apprehended, and much ſtolen property hath been recovered.

HUERS. See BALKERS and *Pilchard* FISHERY.

HUG, or *Corniſh* HUG, a term uſed in wreſtling, when one has an advantage on his breaſt, and holds him faſt there.

HUGONIA, in *Botany*, the name of a genus of plants of the *monadelphia decandria* claſs, the characters of which are theſe: the perianthium is ſmall, narrow, acute, and divided into five ſegments; the flower is compoſed of five large, round, and expanded petals; the ſtamina are ten ſubulated filaments, ſhorter than the flower; the antheræ are ſimple; the germen of the piſtil is roundiſh; the ſtyles are five in number, and are very ſlender; the ſtigmata are capitated; the fruit is a globoſe berry, aſſixed upon the cup; the ſeed is ſingle, ſtriated, and hard.

HUGUENOTS, an appellation given by way of contempt to the reformed or proteſtant Calviniſts of France.

The name had its firſt riſe in 1560; but authors are not agreed as to the origin and occaſion thereof: but one of the two following ſeems to be the leaſt forced derivation.

One of the gates of the city of Tours is called the gate Pourgon, by corruption from *ſes Hugon*, *i. e. the late Hugon*. This Hugon was once count of Tours, according to Eginhardus, in his Life of Charles the Great, and to ſome other hiſtorians. He was it ſeems a very wicked man, who by his fierce and cruel temper made himſelf dreadful; ſo that after his death he was ſuppoſed to walk about in the night time, beating all thoſe he met with: this tradition the judicious Thuanus has not ſcrupled to mention in his hiſtory. Davila and other hiſtorians pretend, that the nickname of *Huguenots* was firſt given to the French proteſtants, becauſe they uſed to meet in the night time in ſubterraneous vaults near this gate of Hugon; and what ſeems to countenance this opinion is, that they were firſt called by the name of *Huguenots* at this city of Tours.

Others aſſign a more illuſtrious origin to that name; and ſay that the leaguers gave it to the reformed, becauſe they were for keeping the crown upon the head of the preſent line deſcended from Hugh Capet; whereas they were for giving it to the houſe of Guiſe, as deſcended from Charles the Great.

Others again derive it from a French and faulty pronunciation of the German word *eidgnoſſen*, ſignifying *confederates*, and originally applied to that valiant part of the city of Geneva, which entered into an alliance with the Swiſs cantons, in order to maintain their liberties againſt the tyrannical attempts of Charles III. duke of Savoy. Theſe confederates were called *Eignots*, whence *Huguenots*.

The perſecution which they underwent has ſcarce its parallel in the hiſtory of religion: though they obtained a peace from Henry III. in 1576, it was only of ſhort continuance; and their ſufferings, mitigated by the famous edict of NANTES, granted to them in 1598 by Henry IV. were again renewed, after the revocation of this edict, by Lewis XIV. in 1685.

HUISSIER, a French name for an uſher, ſerjeant, or beadle.

HUITINGO *pilchardus*, in *Ichthyology*, the fiſh we commonly call in Engliſh the whiting-pollack. It is a fiſh very like the common whiting in ſhape, but much larger, and is ſomething broader, and leſs thick. It is common in the northern ſeas, and is a good fiſh for the table. Its food is other ſmaller fiſh, and particularly the ammodytæ or ſand-eels, numbers of which are uſually found in its ſtomach. It is diſtinguiſhed from the cod by its head, being ſmaller, and its body broader and thinner, by its having no beard; and its lower pair of fins is much ſmaller than in the laſt fiſh.

HUJUS, or HUJUSCE DIEI, in *Aſtrology*, a ſurname given by the Romans to FORTUNE. She had a temple at Rome, erected by Q. Catulus.

HULKS are large veſſels, having their gun-decks from a hundred and thirteen to a hundred and fifty feet long, and from thirty-one to forty feet broad, and fitted with an apparatus, in order to fit or take out the maſts of his majeſty's ſhips, as occaſion requires. They will carry from four hundred to a thouſand men.

Anciently, the word *hulcus* ſeems to have ſignified a *ſmall veſſel*.

HULK is alſo a name beſtowed on any old veſſel laid by, as unfit for farther ſervice. It is probably derived from the *ulcus*, or veſſels of burthen of the ancient Greciens.

HULL *of a ſhip* is her main body without any maſts, yards, ſails, or rigging. See *Teb. Ships. fig.* 1. *lit.* A *to* B.

To HULL, or *lie a* HULL, is underſtood of a ſhip, when, either in a dead calm, or in a ſtorm, ſhe cannot carry all her ſails, but they are taken in to preſerve them; ſo that nothing but her maſts, yards, and rigging, are abroad, and her helm tied down to the lee-ſide of the ſhip. In this ſtate ſhe will lie eaſily under the ſea, if ſhe be a good ſailer, and make her way one point before the beam.

To ſcudde a HULL, is to lie cloſely or obſcurely in the ſea in a ſtorm, or to carry for ſome conſort, bearing no ſail, with the helm laſhed a-lee.

To HULL *a ſhip*, is to fire cannon-balls into her *hull*, within the point-blank range.

HULLOCK *of a ſail*, at *Sea*, is when, in a great ſtorm, ſome ſmall parrot of a ſail is cut and left looſe. It is chiefly uſed in the mizzen-ſail, to keep the ſhip's head to the ſea; then all the reſt of the ſail is made up, except a little at the mizzen-yard-arm. Alſo, when a ſhip will not *wear* or *veer ſtern*, to lay her head the other way, they looſe a *bullock* of her fore-ſails; and then changing the helm to the weather ſide, ſhe is made to fall off, and to lay her head where her ſtern lay.

HUMAN, ſomething that relates to man, or the NATURE of man.

The *human* body is the ſubject of medicine. See *Human* Body.

Epicurus and his followers deny that the gods concern themſelves with *human* affairs. See EPICUREANS.

Faith is diſtinguiſhed into divine and *human*. See FAITH.

HUMANITY, the nature of MAN, or that which denominates him human.

Neſtorius would not allow the infirmities of *humanity* to be attributed to the Deity; nor the attributes of the Deity to *humanity*. See NESTORIANS.

HUMANITIES is uſed, plurally, for the *humaniores literæ*, i. e. the ſtudy of the Greek and Latin tongues, grammar, rhetoric, poetry, and the ancient poets, orators, and hiſtorians.

HUMATION, *Humatio*. The moſt ancient way of diſpoſing of the dead was by *humation*, or interment. Pliſie. See BURIAL.

HUMBLE-*bee*, in the *Hiſtory of Inſects*. See BOMBYLIUS.

HUMBLE-*bee*, *baſtard*. See FAUX *bourdon*.

HUMBLE-*bee flies*, in *Natural Hiſtory*, the name of a claſs of flies of different ſizes, but all agreeing in the great reſemblance they bear to the *humble-bees*, of the ſmaller or middle-ſized ſpecies. Theſe might, at firſt ſight, very naturally paſs for real *humble-bees*; but a cloſer examination will ſhew them not to be ſuch, as they have not the trunk of the *humble-bee*, and have only two wings. The ſpecies of the *humble-bee* fly are many of them of abſolutely different genera one from another, ſome of them having trunks, and others having a diſtinguiſhable mouth. See CULEX.

If the figure of theſe flies, in their winged ſtate, attracts our curioſity and attention, their prior ſtate, that of the fly-worm, of moſt of them ought ſurely much more to do ſo. The place nature has aſſigned the worms of theſe flies for their habitation, is indeed a moſt ſtrange one; there is no other place for them to live in under the ſun, to begin their deſtined growth, and be fitted for their tranſformations, but in the inteſtines of horſes, under the thick and firm ſkin of oxen. In the latter caſe, the worm hatched from the egg of its parent fly, depoſited there, makes the rumor in the places which alone furniſhes it with food and habitation, and in the middle of which it has a place to breathe. See HORSE-*worm*.

It is not an invariable law of nature, however, that all

the worms of the *humble-bee* flies are to feed on animal fubſtances; for we find ſome delighted with vegetable food, and particularly one which loves none but the bulbous roots of flowers. Reaumur's Hiſt. Inſ. vol. iv. p. 495, &c.

HUMELE *plant*. See SENSITIVE *plant*.

HUMECTATION, formed of *humor*, *moiſture*, *moiſtening*, in *Pharmacy*, the preparing of a medicine, by ſteeping it a while in water, in order to ſoften and moiſten it when too dry; or to cleanſe it, or prevent its ſubtle parts from being diſſipated in grinding, or the like.

HUMECTATION is alſo uſed for the application of moiſtening remedies.

In this ſenſe we ſay, embrocations, emplaſters, unctions, *humectations*, fomentations, &c.

HUMERUS, or *Os* HUMERI, in *Anatomy*, the uppermoſt bone of the arm, popularly called the *ſhoulder-bone*; extending from the ſcapula, or ſhoulder-blade, to the upper end of the cubitus, or elbow. See *Tab. Anat. (Oſteol.) fig.* 3. *n.* 6. *fig.* 7. *n.* 8. *fig.* 3.

The *humerus* is a large, round, fiſtular bone, of a pretty hard compact ſubſtance; its inward cavity, which contains the marrow, is conſiderably long and large.

At its upper end it has a large round head, which is covered with a very ſmooth cartilage, and is received into the cavity of the ſcapula, which makes a juncture per arthrodiam. This head of the bone being much larger than the ſocket into which it is received, the part extant is ſtrictly embraced by a ligament, one edge of which is faſtened to the margin of the cartilaginous ſocket of the ſcapula, and the other to the lower part of the head of this bone, hereby uniting them firmly together; yet ſo as to leave the motion the freeſt of all the articulations of the body, and therefore the bone very liable to diſlocations.

At the lower end of the *humerus* are two proceſſes, covered each with a cartilage; the external and leſſer receiving the extremity of the radius, and the internal the head of the cubitus.

On the outſide of each of theſe proceſſes is a ſmall eminence, to which are faſtened the ligaments and heads of the muſcles that move the carpus and fingers.

In this bone are alſo three ſinuſes; one on the fore-ſide of the large proceſs, receiving a proceſs of the cubitus; another on the back-part, which receives the olecranum; and the third, a ſmall ſemilunar one between the two proceſſes, anſwering to the eminence of the ſinus of the cubitus.

The later anatomiſts allow this bone five different motions, viz. upwards, downwards, forwards, backwards, and rotatory; and five pair of muſcles for the performance of the ſame, viz. the deltoides, teres, pectoralis, infraſpinatus, ſubſcapularis, &c. which ſee.

Os HUMERI, *cartilages of the*. The cartilage by which the hemiſphere at the head of the *os humeri* is covered, is gradually thicker towards the middle, and thinner towards the edges. The four ſurfaces of the tuberoſities, which appear cartilaginous in dry bones, ſerve only for the inſertion of the tendons of four muſcles, which move the *os humeri* on the ſcapula. The channel or ſinus between the two tuberoſities is partly covered by a thin cruſt, which appears rather ligamentary than cartilaginous, and partly by a tendinous ſtratum. The trochlea and ſmall head of the lower extremity of the *os humeri*, are covered with a common cartilage, in which the ſame proportion of thickneſs is obſervable, as in that of the upper extremities; and this holds indeed pretty generally of the convex articular cartilages; and the foſſulæ near the pulley and the ſmall head, are covered with a thin cartilaginous and ligamentary varniſh.

Os HUMERI, *ligaments of the*. The capſular, or mucilaginous ligament, looſely ſurrounds the whole articulation of the ſcapula with the head of the *os humeri*. The true ligament of this joint ſeems to be made up of two ſorts of ligaments cloſely united together, viz. of a capſular ligament, which ſurrounds the whole articulation, and of ſeveral true ligaments which run over, and cloſely adhere to the former at different diſtances. On the body of the *os humeri* there are two particular ligaments, which may be termed the intermuſcular, or lateral ones; they are long, flat, thin, but ſtrong and narrow, fixed by one edge along the two lower thirds of the bone, and reaching to both condyles; they are broad, pretty tight, and are very narrow at the upper part, but broader toward the condyles.

The lower extremity of the *os humeri* is joined to the bones of the fore arm, by two faſciculi of ligamentary fibres, one fixed to the internal condyle, the other to the external. Each faſciculus is compoſed of fibres cloſely joined together near the condyle, but afterwards parting in diſtinct bands like a gooſe's foot. The capſular ligament is fixed to the condyles, and then covers them, and is afterwards fixed round both ſides of this lower extremity above the foſſulæ. The foſſulæ are ſlightly varniſhed over alſo with a cartilaginous ſubſtance. This capſula ſeems to be ſtrengthened by a ligamentary web, the fibres whereof croſs one another in different directions, and appears larger and looſer when the muſcles are ſeparated from it, than when cloſely united to them in its natural ſtate. Winſlow's Anatomy, p. 139.

HUMERUS, *luxated*. The *humerus*, from the length and laxity of its ligaments, the largeneſs of its motion, and the ſhallowneſs of its cavity in the ſcapula, into which it is articulated, is rendered, of all the bones, the moſt ſubject and eaſy to be luxated. The head of this bone may often be diſlocated, under the arm-pit; ſometimes forward, ſometimes backward, and even below the ſcapula, but ſeldom perpendicularly downwards, and never directly upwards, unleſs the acromion and coracoid proceſſes of the ſcapula ſhould chance to be fractured at the ſame time; beſides, as long as the ſtrong deltoid and bicipital muſcle of the *humerus* remain entire, they greatly reſiſt and keep down the *humerus* from being luxated upwards.

A diſlocation of the *humerus* may be known by a depreſſion or cavity on the top of the ſhoulder, and an inability to move the arm. When the diſlocation is downward or forward, the arm is elongated, and a ball or lump is perceived under the arm-pit; but when it is backward, there appears a protuberance behind the ſhoulder, and the arm is thrown forward toward the breaſt.

As ſoon as a luxation is diſcovered in the *humerus*, the ſafeſt way to attempt the reduction of it, is to place the patient on the floor, or on a low ſtool: two ſtrong aſſiſtants are then to be placed on each ſide of him, one to keep firmly hold of his body, that it may not give way to the extenſion, while the other lays hold of the luxated arm with both his hands, a little above the cubitus, gradually and ſtrongly extending it. But before that extenſion be made, the ſurgeon himſelf ſhould have a large and ſtrong napkin, of a ſufficient length, tied at the ends, and hung about his neck, ſo that the knot may hang behind, but the other part of the napkin over his breaſt. The patient's arm muſt then be put through this napkin up to the ſhoulder, and the ſurgeon muſt lay hold of the head of the *humerus* with both his hands: this done, the aſſiſtant, who has hold of the arm, is to extend it ſufficiently, and the ſurgeon is to elevate the head of the *humerus*, by means of the napkin through which the arm is put, directing it with his hands, till it ſlips into its former cavity in the ſcapula.

This ſeems the moſt ſafe, ready, and commodious of all methods, for reducing luxations of the *humerus*; but it is to be acknowledged, that the extenſion cannot, by this means, be made ſufficiently ſtrong, in ſome caſes, particularly when the patient is very robuſt, or when the caſe has been delayed a conſiderable time without aſſiſtance. When one or two aſſiſtants therefore are not ſufficient to make a proper extenſion, it is eaſy to employ more, by means of napkins tied about the limb, and a proper number of aſſiſtants to hold the patient's body ſteady againſt that force. And when *all* this is not ſufficient, the ſurgeon is forced to have recourſe to machines with ropes and pullies; which, though the patient is uſually terrified a little at them, yet make an eaſier and a more equal and regular extenſion than can be done by the hands of ever ſo many aſſiſtants. Heiſter, book iii. cap. 7. See AMBE.

Mr. Freke has contrived a portable inſtrument for this purpoſe, which conſiſts of two boxes A, A, joined together by the hinge, F, in the middle, in which, when folded together, is contained all the apparatus neceſſary for reducing a diſlocated ſhoulder. *See Tab.* III. *Surgery, fig.* 32.

The length of this inſtrument, when ſhut up, is one foot eight inches, its breadth nine inches, and its thickneſs three inches and a quarter. When it is opened, it is kept ſo by two hooks fixed on the back-ſide of it; and, when one end of it ſtands on the ground, the other ſtands high enough to become a fulcrum, or ſupport of the lever B B, which is fixed on a roller *b*, by a large wood-ſcrew, which turning ſideways, as well as with the roller, it obtains a circumrotatory motion, ſo that it will ſerve to reduce a luxation, either backward, forward, or downward. The roller on which the lever is fixed, is juſt the diameter of the depth of one of the boxes, into which are driven two iron pins, the ends of which are received by the two ſides of the box, which are an inch thick. The lever is two feet four inches long, and is cut off and joined again by two hinges C, to fold up ſo as to be contained in the boxes. On the backſide of it is a hook, to keep it ſtraight. One other end of it is to hang over the roller about an inch and a half, which is

to be excavated and covered with buff leather, for the more eafy reception of the head of the *os humeri*. Two iron checks, D, are ferewed on each fide of the lever, to receive through them an iron roller, which has two holes through it, to receive two cords coming from a brace E, fixed on the lower head of the *os humeri*; for if it be applied on the mufcular part of the arm, it never fails ſlipping down to the joint, before you can extend the limb. The iron roller has a ſquare end, on which is fixed a wheel G, within the check notched round, which works as a ratchet, on a ſpring-ketch underneath the lever, by which it is ſtopped, as you wind it with a winch; and may at pleaſure be let looſe, as there ſhall be occaſion for it, by diſcharging the ketch. The brace E, compared with common bandages, is of more conſequence than can eaſily be imgined by unexperienced perſons. It conſiſts of a large piece of buff leather, big enough to embrace the arm, ſewed on two pieces of ſtrong iron curved plates, rivetted together, one of them having an eye at each end to faſten two cords in; the other is bent at the ends into two hooks, which are to receive the cords, after they have croſſed over the arm above.

In order to keep the patient ſteady in his chair from coming forward, or letting the ſcapula riſe up on depreſſing the lever, after the limb is extended by the winch, there muſt be fixed over the ſhoulder a girth, H, H, with two hooks at the end of it, long enough to reach to the ground on the other ſide, where it muſt be hooked into a ring I, ſerewed into the floor for that purpoſe.

We ought not to omit obſerving here, that there are ſeveral other contrivances invented both by ancient and modern ſurgeons for reducing a luxation of the *humerus*; ſome of which the reader will find deſcribed in Heiſter's Surgery, part i. book iii. cap. 7.

After all, Mr. Heiſter obſerves, that the ſurgeon's hands and a napkin, with ſtrong and dexterous aſſiſtants to make the extenſion, and hold the patient firm, will, of themſelves, be generally ſufficient for this purpoſe.

Mr. White, ſurgeon of the Mancheſter infirmary, gives an account of a new method of reducing ſhoulders, without the uſe of an ambe, which he has tried with ſucceſs in caſes where the common methods have failed. For this purpoſe, having ſerewed an iron ring into a beam at the top of the room, he fixed one end of his pulleys to it, and faſtened the other to the diſlocated arm by ligatures about the wriſt, placing the arm in an erect poſition. In this manner he drew up his patient, till his whole body was ſuſpended, whilſt two perſons ſupported his arm above the elbow. He then attempted to conduct the bone into its place with his hands; when feeling it to give way, and hearing it ſnap, he concluded it muſt have returned into the ſocket, and ordered him to be let down as carefully as poſſible. The bone having ſomewhat changed its ſituation, he tried the heel in the armpit, and the bone returned to its place with the greateſt facility. Lond. Med. Obſ. &c. vol. ii. p. 373, &c.

Of HUMERI *fractured.* Fractures of the *os humeri* are the leaſt dangerous when near its middle, and much worſe when near its upper or lower head. It ſometimes happens, that the fractured ends of this bone keep their places, but much more frequently they are found ſlipped over one another; by which means the fractured limb is made ſhorter than the ſound one: ſometimes alſo, though much more rarely, it happens, that the divided ends of the bone recede from one another, on account of the weight of the arm, and by that means the fractured limb becomes longer than the ſound one. In fractures of this bone, where the ends of the divided bone have ſlipped one over another, as is uſually the caſe, there are required both force and ſkill to reduce them, eſpecially if the patient has ſtrong and large muſcles, as is uſually the caſe with ſtrong men. To extend the arm on this occaſion, the patient muſt be ſeated on a high ſtool, and an aſſiſtant muſt lay hold of his arm firmly above the fracture, keeping his elbow gently bent: then the lower part of the arm beneath the fracture is in like manner to be taken hold of, and the arm to be gently extended forward, by endeavouring to remove eaſily each part from the other, in a right line. The ſurgeon is then to take hold of the fractured part of the arm, and with both his hands reduce the fractured bones into their proper places, while the arm is kept in a proper ſtate of extenſion by the aſſiſtants; and when they are replaced, the limb is to be rolled up with the proper bandages. Heiſter's Surg. book ii. chap. 7.

HUMERI *externi*, in *Anatomy*, a name given by Fallopius, and others, to a muſcle called by Cowper, and ſince by Albinus and others, TERES *minor*, and by the French SOUSSCAPULO-*fo petite rondo*.

HUMERUM *attollens*, in *Anatomy*, a name given by Spigelius, and others, to a muſcle now generally known under the name of the DELTOIDES.

HUMERI *primus*, in *Anatomy*, a name given by ſome anatomical writers to a muſcle generally known under the name of the PECTORALIS.

HUMETTY. in *Heraldry*. See RACCOURCY.

HUMID, HUMIDUM, *muſt*. The ſchool philoſophers make water the *primum humidum*, the firſt of *humid* bodies, and the cauſe or principle of humidity in others; which are more or leſs moiſt, as they partake more or leſs of this element.

HUMIDITY, *moiſture*; the quality or power of wetting or moiſtening other bodies. See MOISTURE and HYGROMETER.

Modern writers conſider *humidity* as a particular ſpecies of fluidity; and define it a fluor, which, being applied on a ſolid body, adheres to, and communicates the quality to other bodies. Others, ſomewhat more accurately, call *humidity* the power whereby a body moiſtens another; but what that power is they do not ſhew.

But of this we are certain, *humidity* is only a ſort of relative mode. So far as the component particles of a fluid, compared with reſpect to the pores and particles of other bodies, or the texture thereof, are apt and diſpoſed to enter thoſe pores, or ſtick to thoſe particles, ſo far is that fluid humid: on the contrary, ſo far as there is a repugnance or incongruity between the particles, &c. in reſpect of ſuch bodies, the fluid is not *humid*.

Thus quickſilver is not moiſt in reſpect to our hands or cloaths, and other things, which it will not ſtick to; but it may be called *humid*, in reference to gold, tin, or lead, to whoſe ſurfaces it will preſently adhere, and render them ſoft and moiſt. Even water itſelf, which wets almoſt every thing, and is the great ſtandard of moiſture and *humidity*, is not capable of wetting all things; for it ſtands or runs off in globular drops from the leaves of cabbages, and many other plants; and it will not wet the feathers of ducks, ſwans, and other water-fowl.

Add, that the texture alone may cauſe the fluid to be *humid*; as is plain, in that neither quickſilver, lead, nor biſmuth, alone will ſtick upon glaſs; yet, being mixed together, they will form a maſs that will do ſo; as appears from ſuch a compoſition being frequently uſed in ſoliating looking-glaſſes.

HUMIDUM *radicale*, or *radical moiſture*. This in reality ſeems to amount to no more than the pureſt and moſt defecate part of the nutritious matter, in a condition ready to be aſſimilated.

By too much heat in fevers, hectics, &c. this *humidity* is too haſtily exhauſted and ſpent. See RADICAL.

HUMILIATI, a congregation of religious in the church of Rome, eſtabliſhed by ſome Milaneſe gentlemen on their releaſe from priſon, where they had been confined under the emperor Conrad, or, as others ſay, under Frederick I. in the year 1162. This order, which acquired great wealth, and had no leſs than ninety monaſteries, was aboliſhed by pope Pius V. in 1570, and their houſes given to the Dominicans and Cordeliers, for their luxury and cruelty.

HUMILIATION, the act of humbling, i. e. of abating a perſon's pride, and bringing him lower in his opinion. In this ſenſe *humiliation* ſtands diſtinguiſhed from mortification: *humiliation* brings down the mind; mortification ſubdues the fleſh.

HUMILIS *muſculus*, in *Anatomy*, a name mentioned by Caſſerius, as given by ſome people of his time to one of the muſcles of the EYE, the rectus inferior of Fabricius, and depreſſimus of Riolan: it is the depreſſor oculi of Albinus, being one of the quatuor recti muſculi oculorum of that author.

HUMILITY, in *Ethics*, is a virtue conſiſting in the moderate value which a perſon puts upon himſelf, and every thing relating to him. Or, more particularly, it conſiſts in not attributing to ourſelves any excellence or good which we have not; in not overrating any thing which we have or do; in not taking an immoderate delight in one's ſelf; in not aſſuming more of the praiſe of a quality or action than belongs to us, and in a lowly ſenſe and acknowledgement of our imperfections, errors, and ſins. This virtue expreſſes itſelf in the modeſty of our appearance, of our purſuits, and of our behaviour towards other men. It is diſtinguiſhed from affectation, baſhfulneſs, and meanneſs.

HUMISUGA, the *Ground-ſucker*, in *Natural Hiſtory*, the name of a fly, ſo called, becauſe it is ſuppoſed to live by ſucking the juices of the earth, without taking it as ſolid food. It has a brownith or dun body with white ſpot at the inſertion of the wings, and another at the back; the legs are black; the back is grey, with four ſullied white lines running longitudinally; the wings are very, and, if put into water, they ſhine with a bright light like that of the glow-worm. This creature is common with us about path-ways, on mole-hills, and in other places where the ground is newly turned up. We call it the *path-fly*.

HUMMING-*bird*, *Trochilus*, or *Guainumbi*, in *Ornithology*, the name of a very beautiful genus of American birds, the

the diſtinguiſhing characters of which are, that its beak is of a ſubulated figure, but ſmall as a thread; it is longer than the head, and terminated in a fine tube or pipe; the upper mandible forms a kind of ſheath or caſe for the lower; the tongue is fiſſiform, and rendered tubulous by the junction of two threads; and the feet are formed for walking. Linnæus enumerates twenty-two ſpecies of this genus. Mr. Edwards has likewiſe deſcribed ſeveral different ſpecies. The leaſt ſpecies is the ſmalleſt of all birds, but of the moſt beautiful and lively colours of all others: the colour of the body is a ſhining green; it flies very ſwiftly, and in flying makes a noiſe exactly like the humming of a bee, and is not much larger than the humble-bee; it can ſuſtain itſelf a long time on the wing, and in that poſture thruſts its little beak into flowers, the juices of which it ſucks and feeds on. As it has no other food but this, there is no keeping it alive, but all die that are taken; and they are preſerved and ſent over as curioſities to us. Many have reported ſtrange ſtories of their ſleeping all the winter-months, and reviving at the approach of ſpring; but Maregrave ſaw them in great plenty in the woods in all ſeaſons. The Indians make pictures with the feathers of theſe birds, which are ſo brightly coloured, as to vie with the fineſt paint, and ſo thin as to be as cloſe as colours on canvas. Ray's Ornithol. p. 165.

The humming-bird is ſo ſmall, that its leg and foot together meaſure but half an inch, and its whole trunk not an inch. The body weighs only one-tenth of an ounce, which is about equivalent to a ſilver ſix-pence; whereas a titmouſe, the ſmalleſt bird among us, weighs two ſhillings, or half a crown. Its neſt, which is made of cotton, is much of the ſize and figure of the thumb of a man's glove; its egg about the bigneſs of a pea. Some of the Indians wear them in their ears for pendants. Phil. Tranſ. N° 200. p. 760; and N° 206. p. 993, or Abr. vol. ii. p. 854. See *Tab.* III. *of Birds, fig.* 23.

HUMOR, or HUMOUR. See HUMOUR.

HUMORISTS, *or* HUMORISTI, the title of a celebrated academy of learned men at Rome. See ACADEMY *of Humoriſts.*

HUMOROSI, the name of an academy eſtabliſhed at Cortona in Italy.

The *Humoroſi* of Cortona muſt not be confounded with the *Humoriſti* of Rome.

HUMOUR, or HUMOR, in its general ſenſe, ſignifies the ſame as *liquor*, or LIQUID.

HUMOUR, in *Medicine*, is applied to any juice or fluid part of the body; as the chyle, blood, milk, fat, ſerum, lymph, ſpirits, bile, ſeed, ſaliva and pancreatic juices, &c. See each of theſe under its proper head, CHYLE, BLOOD, BILE, &c.

The *four humours*, ſo much talked of by the ancient phyſicians, are four liquid ſubſtances, which they ſuppoſe to moiſten the whole body of all animals, and to be the cauſe of the divers temperaments thereof.

Theſe are *phlegm*, *blood*, *bile*, and *melancholy*.

But the moderns do not allow of theſe diviſions. The *humours* they rather chooſe to diſtinguiſh into *nutritious*, called alſo *elementary*; as chyle and blood; thoſe ſeparated from the blood, as bile, ſaliva, urine, &c. and thoſe returned into the blood.

Humours, again, are diſtinguiſhed into *natural*, or ſalutary, and *morbid* or corrupted. To the former claſs belong all the juices ordinarily ſecreted for the uſes of the body.

To the latter belong thoſe compound *humours*, which thickening and growing putrid, cauſe tumors, abſceſſes, obſtructions, and moſt diſeaſes.

Theſe are diſtinguiſhed by various names; *malignant*, *aduſt*, *acrimonious*, *corroſive*, *crude*, *peccant*, &c.

HUMOUR is alſo uſed for the particular temperament or conſtitution of a perſon, conſidered as ariſing from the prevalence of this or that *humour*, or juice of the body. Thus we ſay, a bilious, choleric *humour*; a phlegmatic *humour*; a melancholic, hypochondriac *humour*; a ſanguine, gay, ſprightly *humour*, &c.

HUMOURS *of the eye*. Anatomiſts and opticians diſtinguiſh three particular *humours* of the EYE; which they call the AQUEOUS, CRYSTALLINE, and VITREOUS.

Theſe three *humours* have each their ſhare in the refraction of the rays of light neceſſary to viſion.

Authors, both ancient and modern, ſpeak of the regeneration of the *humours* of the eye; and give us inſtances of their reproduction, when, by any accident, they had been let out; but their inſtances, ſtrictly conſidered, generally go no farther than to the aqueous and vitreous *humours*.

Borri only, in a letter to Bartholine, ſays as much of the cryſtalline. He aſſirms, that he has ſlit the pupil of the eye of divers animals, and ſqueezed out all the *humours*, even the cryſtalline, and has afterwards perfectly reſtored them again to ſight; and that the eyes of the *birds*, whereon the operation had been performed, inſtead of being damaged thereby, were rendered more lively and vigorous than uſual. He adds, that he had performed the ſame experiment on divers perſons, with ſo much ſucceſs, that there remained not the ſmalleſt appearance of a cicatrix in the eye. See CATARACT.

HUMOUR is alſo uſed in *Dramatic Poetry*, for a ſubordinate ſpecies of what the critics call *manners*.

Humour is uſually looked on as peculiar to the Engliſh drama, at leaſt our comic poets have excelled therein, and carried it beyond thoſe of any other nation; and our's is, perhaps, the only language that has a name for it.

Humour is uſually conſidered by critics as a fainter or weaker habitual paſſion peculiar to comic characters, as being chiefly found in perſons of a lower degree than thoſe proper for tragedy.

Every paſſion may be ſaid to have two different faces: one that is ſerious, great, formidable, and ſolemn, which is for tragedy; and another that is low, ridiculous, and fit for comedy; which laſt is what we call its *humour*.

Wit only becomes few characters: it is a breach of character, to make one half the perſons in a modern, or indeed in any comedy, talk wittily and finely; at leaſt at all times, and on all occaſions. To entertain the audience, therefore, and keep the dramatic perſons from going into the common, beaten, familiar ways and forms of ſpeaking and thinking, recourſe is had to ſomething to ſupply the place of wit, and divert the audience, without going out of character; and this end is attained by *humour*; which therefore is to be looked on as the true wit and humour.

A very good judge, the duke of Buckingham, makes *humour* to be all in all: wit, according to him, ſhould never be uſed, but to add an agreeableneſs to ſome proper and juſt ſentiment, which, without ſome ſuch turn, might paſs without its effect.

HUMOUR, *or continued wit*, in *Oratory*, is a certain ſprightlineſs and vivacity of thought, which runs through a diſcourſe, and ſhews itſelf in agreeable images, beautiful turns, and a facetious manner of expreſſion, ſuited to the ſubject, and affecting the hearers with pleaſure and delight, though not to that degree as to excite laughter, or any great emotion of the paſſions.

HUMP-*back*. See GIBBOUS.

HUMULUS, *in Botany*. See HOP.

HUNDRED, *centum*, *cent.* the number of ten times ten, or the ſquare of ten.

The place of *hundreds* makes the third in order in the Arabic numeration.

We uſually expreſs the proportion of the profits made in the way of commerce, &c. by the *hundred*.

HUNDRED is alſo uſed as a meaſure to expreſs a certain quantity or number of things. A hundred of ſalt at Amſterdam is fourteen tuns.

Deal boards are ſold at ſix ſcore to the *hundred* called the *long hundred*. Pales and laths are counted at five ſcore to the *hundred*, if five feet long; and ſix ſcore, if three feet long.

HUNDRED *weight*, or the *great hundred*. See QUINTAL.

HUNDRED, *decimoſſis*. See CENTNER.

HUNDRED, HUNDREDUM, *centuria*, is alſo a part or diviſion of a SHIRE or COUNTY. It was ſo called, according to ſome, becauſe each *hundred* found a *hundred* fidejuſſors or ſureties of the king's peace, or a *hundred* able men of war.

Others rather think it to have been ſo called, becauſe originally compoſed of a *hundred* families. It is true, Brompton tells us, that a *hundred* contains *centum villas*; but then Giraldus Cambrenſis writes, that the iſle of Man hath three hundred and forty-three villas. In both theſe places the word villa muſt be taken for a country family; for it cannot mean a village, becauſe there are not above forty villages in that iſland.

So, where Lambard tells us, that a *hundred* is ſo called, *a numero centum hominum*, it muſt be underſtood of a *hundred* men who are heads and chiefs of ſo many families.

Hundreds were firſt ordained by king Alfred, the twenty-ninth king of the Weſt Saxons: *Alfredus rex* (ſays Lambard, *verbis* centuriæ) *ubi cum Gothrum Dana ſædus inierat, prudentiſſimum olim Jethronis Moſis dictum ſecutus conſilium, Anglium primas in ſatrapias, centurias, & decurias partitus eſt. Satrapiam, ſhyre, a* Scyrian (quam partiri ſignificat) *nominavit, centuriam* hundred; *& centuriam, tenthing ſive tiendmantale*, i. e. *decemvirale collegium, appellavit; atque iiſdem nominibus vel hodie venantur*, &c. See COUNTY and TITHING.

This diviſion of counties into *hundreds*, for the better government, king Alfred borrowed from Germany, where *centa*, or *centina*, is a juriſdiction over a hundred towns. Such is the original of *hundreds*, which ſtill retains the

name; though the jurisdiction be devolved to the county-court, some few excepted, which have been by privilege annexed to the crown, or granted to some great subject, and so remain still in the nature of a franchise.

This has been ever since the stat. 14 Edw. III. whereby these *hundred* courts, formerly farmed out by the sheriff to other men, were all, or most part, reduced to the county-court, and so remain at present; so that where we read now of *hundred*-courts, they are to be understood of several franchises, wherein the sheriff has nothing to do by his ordinary authority, except they of the *hundred* refuse to do their office.

If any homicide be committed, or dangerous wound given in the day-time, and the offender escape, the town shall be amerced; and if out of a town, the *hundred* shall be amerced. The *hundred* shall also make good the damages, in case of a robbery (see HUE *and* CRY), cutting banks or hop-binds; burning houses, barns, out-houses, hovels, cocks, mows, or stacks of corn, straw, hay, or wood; mines, or pits of coal; destroying grasiries or corn intended for exportation; destroying turnpikes or works of navigable rivers, &c. 1 Geo. I. cap. 5. 9 Geo. I. cap. 22. 29 Geo. II. cap. 36. 8 Geo. II. cap. 22. 16 Geo. II. cap. 32. 11 Geo. II. cap. 22. 22 Geo. II. cap. 46.

HUNDRED, or HUNDREDUM, is sometimes also used for an immunity or privilege, whereby a man is quit of the *hundred*-penny, or custom, due to the *hundred*.

HUNDRED-*court*. See COURT.

HUNDRED-*leigh* signifies the *hundred*-court, from which all the officers of the king's forest were freed by the charter of Canutus.

HUNDRED *Suit*, the payment of personal attendance, ordering suit and service at the *hundred*-court.

HUNDREDERS, or HUNDREDORS, HUNDREDARII, are men impanelled, or fit to be impanelled, of a jury upon any controversy, dwelling within the *hundred* where the land in question lies.

HUNDREDER is also used for him who hath the jurisdiction of a *hundred*, and holds the *hundred*-court. See HEADBOROUGH.

Sometimes it is also used for the bailiff of a *hundred*. See BAILIFF.

HUNEN, in the *Materia Medica*, a name given by some writers to the JUJUBE.

HUNGARIAN *Machine*, in *Hydraulics*, is represented *Tab.* IV. *Hydraulics*, *fig.* 40. In this figure AA, is the side of a hill, close by the brink of the shaft or mine-pit BB, which is 104 feet deep below the surface of the ground C at the foot of the hill. In this hill is a large spring of water, 143 feet above the surface of the ground at C (taken in perpendicular measure) and the spring affords much more water than what the spring D, under ground, lets into the mine.

A pipe EFG lets the water down from the spring in the hill, into a close air-tight vessel H that stands at the foot of the hill, and contains 57½ cubic feet, or 43 gallons in wine measure. In this pipe is a cock *a*, which being opened or shut, lets the water of the spring run into H, or stops it, as occasion requires: and in H are two cocks *b* and *c*, the uppermost of which is for letting air into H, and the lowermost for letting the water out of it.

A small pipe I goes from the vessel H on the surface of the ground to a vessel K in the bottom of the mine, and terminates in the top thereof. This vessel is air-tight, and contains 27½ cubic feet, or 205½ gallons in wine measure, which is forced up the ascending pipe I. M, and runs off to waste, at N, above ground. The lower end of this pipe goes down so far into the vessel K, as almost to touch its bottom.

From this vessel, a pipe O goes to the spring D under ground, which lets water into the mine, and would overflow it if the water was not forced up or raised from the mine, through the pipe I. M. The pipe O lets this water into the vessel K when the cock *d* is turned open, and keeps back the water when the cock is shut.

The operation is as follows: the cock *b* being open, and the cocks *a* and *c* shut, and no water in the vessel K, open the cock *d* to let the vessel K fill with water from the spring in the mine. As this vessel fills, the water will drive the air out of it, up through the small pipe I into the vessel H, and all that air will go out of the vessel H by the open cock *b*, and then H will remain, as it was before, full of air in the same state of density as the common air is on the outside of H. When K is full of water, shut the cocks *b* and *d*, and open the cock *a*, to let water run down from the spring in the hill, by the pipe EF, into the vessel H. As the water rises in that vessel, the air will thereby be driven out of it, down through the pipe I, into the vessel K: and as this air is compressed by the weight of the running water in the pipe EF the compressed air will force all the water out of the vessel K, up through the pipe I. M, from which it will run off at N on the surface of the ground; and then the compressed air will rush out, after the water.

When the vessel K in the mine is emptied of water, and the air is heard to begin to rush out, shut the cock *a* to stop the water from the spring, and open the cocks *b* and *c*: then the water that came from the spring will run out of the vessel H by the cock *c*, and air will go in by the cock *b*: at the same time, open the cock *d* in the mine, to let the vessel K fill with water from D the spring in the mine; and as H empties, above-ground, K will fill below it; and the air that remained in K will (by the rising of the water in it) be driven back into the vessel H through the pipe I.

When H is empty of water, and K full, shut the cocks *b*, *c*, and *d*, and open the cock *a*: then H will fill with water from the spring in the hill; and this water, as it rises in H, will force the air out of H, down to the pipe I, upon the water in K; and the force of the compressed air will drive all the water out of K, up to the pipe I. M, from which it will run off at N, as before.

And thus, wherever there is a spring in a hill, near a mine, that affords more water than what flows into the mine from a spring under ground; and the perpendicular height of the spring in the hill is greater than the depth of the mine, water may thus be raised from the mine, in a most simple and easy manner, by an engine in which there are neither pumps, pistons, nor valves: and such an engine will not be liable to be out of order, nor need repairs in many years.

But as there are very few mines that have hills near them with high springs, water cannot then be raised from them in this manner; and therefore *Mr.* Blakey proposed another method, which was, to make H an air-vessel, with a pipe going from it to another vessel in which is water, kept boiling by a fire under it, and this vessel to have a cock to let out the steam occasionally that rises from the surface of the boiling water. When the cock is shut, the steam will go off from the boiler into the air-vessel H, and drive the air out of it, down through the pipe I into the vessel K in the mine: and the force of the air compressed by the elasticity of the steam, will raise the water from K, up through the pipe I. M, till K be emptied of water. Then the cock in the boiler is to be turned open, to let out the steam, and the cock *d* to be opened to let the vessel K fill from the spring in the mine: and when it is full, both these cocks are to be shut, and the operation will go on as before.

That Blakey's scheme would do, the Hungarian machine puts beyond all doubt. In both of them the vessels must be made very strong, because every part of each vessel, equal in surface to the bore of the ascending pipe I. M, will sustain an outward pressure equal to the whole weight of water in that pipe. It will not answer for high depths as the common fire-engine will, nor will it raise so much water; but it may be built for less than a third part of the expence, and would answer very well where the depth is not above a hundred feet.

HUNGARICA *balsa*, in the *Materia Medica*, a medicinal earth, commonly known by the name of *bolus* TOCCAVIENSIS.

HUNGARICUS *morbus*, a disease so called from its being first observed in the imperial army in Hungary, in the year 1566; from whence it spread over a great part of Europe.

It is described as a malignant fever, attended with sickness at the stomach, a pain and hardness about the epigastric region, great thirst from the beginning, a parched tongue, and a constant head-ach, ending in a delirium. It was highly contagious and mortal, and is supposed to have been a compound of the BILIOUS and *hospital* fever, taking its rise first in the camp, but acquiring, that high degree of malignity from the foul air of the place in which the sick were crowded. Pringle, Observ. on the Diseases of the Army, p. 118, & seq.

HUNGARY *water*, *Aqua* HUNGARICA, a distilled water, so denominated from a queen of *Hungary*, for whose use it was first prepared, and who was cured by the continued use of it, of a paralytic disorder.

Hungary-water is one of the distilled waters of the shops, and is directed, in the college dispensatory, to be made of ROSEMARY-flowers infused some days in rectified spirit of wine, and the spirit then distilled. The college of Edinburgh directs a gallon of rectified spirit, to be drawn over in the heat of a water-bath from two pounds of the flowers as soon as they are gathered; that of London takes the tops and a spirit not quite so strong; putting a gallon of proof spirit to a pound and a half of the fresh tops, and drawing off in the heat of a water-bath five pints.

It is an agreeable perfume, and its virtues are much the same as those of the simple it is drawn from. The *Hungary* water brought from France is more fragrant than such as is generally prepared among us.

HUNGER, *fames*, a natural appetite or desire of food. *Hunger* is properly distinguished into *natural* and *animal*. *Natural hunger* is an irritation of the stomach, occasioned by fasting; *animal hunger* is the sensation or perception of that irritation, and the desire of food consequent thereon.

There are various opinions as to the nature, cause, and definition of *hunger*; the point having been controverted from Aristotle to our time. Galen defines it, a painful sensation, arising from a dirosion of the stomach; the other Peripatetics call it an appetite, or desire, of hot and dry, which two systems some authors have endeavoured to reconcile, by taking them both in; and, accordingly, define *hunger* a natural appetite of hot and dry, occasioned by a painful dirosion of the membranes of the stomach, arising from its enzymes.

The modern philosophers speak much more accurately and intelligibly on the point. *Hunger* is generally considered, by them, as owing to the sharpness or acrimony of the liquor contained in the stomach; which, vellicating its fibres, occasions this uneasy sensation. They add, that the occasional cause of this vellication is, the emptiness of the stomach; which not furnishing food for the stomach-liquor to be employed on, exposes its inner membrane to the action thereof.

In effect, it is generally agreed, that there is some menstruous juice, or humour, continually discharged from the excretory ducts of the neighbouring glands into the stomach, to assist in the dissolution and digestion of the food; and that this liquor, after the food is gone, falls upon the stomach itself, and irritates its nerves so strongly, as to propagate the impression to the brain, and thus produce the perception of *hunger*.

This juice some will have to be acid, because bodies of that class are used to whet the appetite, and excite *hunger*; and that fatty bodies more readily remove it than others, by their adhering to the acid spicula, and blunting the points of them.

Others, denying the existence of any such stomach-liquor, and accounting for digestion without it; consequently deny *hunger* to have any dependence thereon. The dry attrition of the coats of the stomach, according to them, is the only cause of it.

On both these principles, they say, it is, that the Indians elude their *hunger*, by swallowing pills, made of tobacco-leaves and calcined shells. These pills take away the appetite; both as the tobacco leaves gradually diminish the sensibility of the stomach; and as the calcined shells absorb the the saline-acid menstruum. Thus also it is, that poor people frequently smoke tobacco to deceive their *hunger*, not to satisfy it: for tobacco affords no nutriment; but it occasions a plentiful spitting, and by this means discharges the body of the acrid humour which causes *hunger*.

The latter system Dr. Drake thus lays down: when all the chyme and chyle is pressed out of the stomach, it follows the motions of its contents, and is again, by means of its muscular coat, reduced to a state of contraction; and by that means the inner coat is brought to lie in folds, which touching and, by means of the peristaltic motion, rubbing lightly, upon one another, produce the gentle sense of fretting, or vellication, which we call *hunger*; which being felt much in the upper orifice, which is first evacuated, begins there to prompt us to repletion: but as, by degrees, the remainder of the contents are expelled, this friction, or rubbing of the membranes upon each other, spreads gradually over the whole stomach, and renders our *hunger* more urgent and impatient, till, by a new repletion, we take away the cause.

Others think the blood, derived from the adjacent ramifications of the arteries into the stomach, sufficient to account for *hunger*, without the mediation either of the attrition, or the menstruum. The mass of blood itself, they observe, is rendered acid through abstinence from food; its soft balsamic parts having been carried into all parts of the body, and lodged therein as nutriment, to supply the absence of those worn off, and exhaled: to which it may be added, that the velocity of the blood is considerably augmented, a good while after eating, beyond what it was during the action of digestion.

Hence it is, 1. That persons of a bilious constitution, young people, and those who labour hard, must sooner find themselves *hungry* than others. 2. That *hunger*, if it hold long, occasions a violent heat, and even sometimes a fever. 3. That those whose humours are crass and viscid, are less incommoded with *hunger* than others.

In effect, we observe, that some animals, whose humours are found to have those conditions, as tortoises, &c. will live a long time without food. For men, six or seven days are commonly supposed the limit within which, if he take no solid food, he dies; though we have instances of abstinence which far surpass this. See ABSTINENCE, BULIMY, and ORexis.

HUNGRY *evil*, a term used among the farriers for the same distemperature in horses, which in men we call a canine appetite. It manifests itself sufficiently in an inordinate desire to eat, and is sometimes the effect of long starving, sometimes of cold, or some other internal or external cause. In the former case the horse not only eats a large quantity, but he devours it in a very remarkable manner, chopping it up as if he would eat the very manger. The method of cure is to give him large mashs of bran steeped in sack, or some other sweet wine; or give him a quantity of wheat flour in wine, or in milk, a quart or more at a time. There are very good remedies in case of exstremity, but otherwise it may be cured by feeding him moderately with bean bread several times a day, allowing no other food.

HUNTER, a name given to a horse qualified to carry a person in the chace. The shape of the horse designed for this service, should be strong and well knit together, as the jockies express it. Irregular or unequal shapes in these creatures, are always a token of weakness. The inequalities in shape which shew a horse improper for the chace, are the having a large head and a small neck, a large leg and a small foot, and the like. The head of the *hunter* should indeed always be large, but the neck should also be thick and strong to support it. The head should be lean, the nostrils wide, and the windpipe straight.

The *hunter*, in order to his behaving well in the field, ought to have great care and indulgence in the stable: he ought to have as much rest and quiet as may be, to be kept well supplied with good meat, clean litter, and fresh water by him; he should be often dressed, and suffered to sleep as much as he pleases. He should be so fed that his dung may be rather soft than hard, and it must be of a bright and clean colour. All this may be easily managed by the continual observance and change of his food, as occasion requires. After his usual feedings he should have exercises and mashes of sweet malt, or bread and beans; or wheat and beans mixed together, are to be his best food, and beans and oats his worst.

Some very great sportsmen are for keeping their horses out at grass all the hard-hunting season, never taking them up into the stable at all, but allowing them in the field as much oats with their grass as they will eat. The horse may be thus rid three days in the week for the whole season, and never damaged by it, nor ever shewing any marks of harm afterwards.

The whole shape of a horse intended for a *hunter*, should be this: the ears should be small, open, and pricked; or though they be somewhat long, yet if they stand up erect, and hold like those of a fox, it is a sign of toughness or hardiness. The forehead should be long and broad, not flat; or, as it is usually termed, mare-faced, but rising in the middle like that of a hare; the feather should be placed above the eye, the contrary being thought by some to threaten blindness. The eyes should be full, large, and bright; the nostrils not only large, but looking red and fresh within; for an open and fresh nostril is always esteemed a sign of a good wind. The mouth should be large, deep in the wicks and hairy. The windpipe should be large, and appear straight when he bridles his head; for if, on the contrary, it bends like a bow on his bridling, it is not formed for a free passage of the breath. This defect in a horse is expressed among the dealers by the phrase cock-throppled. The head should be so set on to the neck, that a space may be felt between the neck and the chine; when there is no such space, the horse is said to be bull-necked, and this is not only a blemish in the beauty of the horse, but it also occasions his wind not to be so good. The crest should be strong, firm, and well risen; the neck should be straight and firm, not loose and pliant; the breast should be strong and broad, the ribs round like a barrel, the fillers large, the buttocks rather oval than broad, the legs clean, flat and straight; and, finally, the mane and tail ought to be long and thin, not short and bushy, the last being counted a mark of dullness. When a *hunter* is thus chosen, and has been taught such obedience, that he will readily answer to the rider's signals both of the bridle and hand, the voice, the calf of the leg, and the spurs; that he knows how to make his way forward, and has gained a true temper of mouth, and a right placing of his head, and has learned to stop and to turn readily, if his age be sufficiently advanced, he is ready for the field. It is a rule with all staunch sportsmen, that no horse should be used in hunting till he is full five years old; some will hunt them at four, but the horse at this time is not come

up to his true ſtrength and courage, and will not only faſt at every tough trial, but will be ſubject to ſtrains and accidents of that kind, much more than if he were to be kept another year firſt, when his ſtrength would be more confirmed.

When the *hunter* is five years old, he may be put to graſs from the middle of May till Bartholomew-tide; for the weather bet ween theſe is ſo hot, that it will be very proper to ſpare him from work. At Bartholomew-tide the ſtrength of the graſs beginning to be nipped by froſts and cold dews, ſo that it is apt to engender crudities in the horſe, he ſhould be taken up, while his coat is yet ſmooth and ſleek, and put into the ſtable. When he is firſt brought home, he ſhould be put in ſome ſecure and ſpacious place, where he may evacuate his body by degrees, and be brought not all at once to the warm keeping; the next night he may be ſtabled up. It is a general rule with many not to clothe and ſtable up their horſes till two or three days after they are taken from graſs, and others who put them in the ſtable after the firſt night, yet will not dreſs and clothe them till three or four days afterward; but all this, except the keeping the horſe one day in a large and cool place, is needleſs caution.

There is a general practice among the groome, in many places, of giving their *hunters* wheat-ſtraw as ſoon as they take them up from graſs. They ſay they do this to take up their bellies; but there ſeems much reaſon to diſapprove of this. The change is very violent, and the nature of the ſtraw ſo heating and drying, that there ſeems great reaſon to fear that the aſtringent nature of it would be prejudicial, more than is at firſt perceived. It is always found that the dung is hard after this food, and is voided with pain and difficulty, which is in general very wrong for this ſort of horſe. It is better therefore to avoid this ſtraw-feeding, and to depend upon moderate airing, warm clothing, and good old hay, and old corn, than to have recourſe to any thing of this kind.

When the horſe has evacuated all his graſs, and has been properly ſhod, and the ſhoes have had time to ſettle to his feet, he may be ridden abroad, and treated in this manner: the groom ought to viſit him early in the morning at five o'clock in the long days, and at ſix in the ſhort ones; he muſt then clean out the ſtable, and feel the horſe's neck, flank and belly, to find the ſtate of his health. If the flank feels ſoft and flabby, there is a neceſſity of good diet to harden it, otherwiſe any great exerciſe will occaſion ſwellings and gouttineſs of the heels. After this examination, a handful or two of good old oats, well ſifted, ſhould be given him: this will make him have more inclination to water, and will alſo make the water ſit better on his ſtomach, than if he drank faſting. After this he is to be tied up and dreſſed. If in the doing of this he opens his mouth, as if he would bite, or attempts to kick at the perſon, it is a proof that the teeth of the curry-comb are too ſharp, and muſt be filed blunter. If after this he continues the ſame tricks, it is through wantonneſs, and he muſt be corrected for it with the whip. The intent of curreying him only to raiſe the duſt, then is to be bruſhed off afterwards with a horſe-tail nailed to a handle, or any other light bruſh. Then he is to be rubbed down with the bruſh, and dreſſed a ſecond time: he ſhould then be rubbed over with a wet hand, and all the looſe hairs, and whatever foulneſs there is, ſhould be picked off. When this is done, and he is wiped dry as at firſt, a large ſaddle-cloth is to be put on, reaching down to the ſpurring place; then the ſaddle is to be put on, and a cloth thrown over it that he may not take cold: then rub down his legs, and pick his feet with an iron picker, and let the mane and tail be combed with a wet mane-comb. Laſtly, it is a cuſtom to ſpurt ſome beer in his mouth juſt before the leading him out of the ſtable. He ſhould then be mounted, and walked a mile at leaſt to ſome running water, and there watered; but he muſt only be ſuffered to take about half his water at one drinking.

It is the cuſtom of many to gallop the horſe at a violent rate as ſoon as he comes out of the water, but this is extremely wrong for many reaſons. It endangers the breaking a horſe's wind more than any other practice, and often has been the occaſion of burſting very good horſes. It uſes them alſo to the diſagreeable trick we find in many horſes, of running away as ſoon as they come out of the water; and with ſome it makes them averſe to drinking, ſo that they will rather endure thirſt, and hurt themſelves greatly by it, than bring on the violent exerciſe which they remember always follows it. The better way is to walk him a little after he is out of the water, then put him to a gentle gallop for a little while, and after this to bring him to the water again. This ſhould be done three or four times, till he will not drink any more. If there is a hilly place near the watering place, it is always well to ride up to it; if otherwiſe, any place is to be choſen where there is free air and ſun. That the creature may enjoy the benefit of this, he is not to be galloped, but walked about in this place an hour, and then taken home to the ſtable. The pleaſure the horſe himſelf takes in theſe airings, when well managed, is very evident, for he will gape, yawn, and ſhrug up his body; and in theſe, whenever he would ſtand ſtill to ſtale, dung, or liſten to any noiſe, he is not to be hindered from it, but encouraged in every thing of this kind.

The advantages of theſe airings are very evident, they purify the blood, teach the creature how to make his breathing agree with the reſt of the motions of his body, and give him an appetite to his food, which *hunters* and racers, that are kept ſtalled up, are otherwiſe very apt to loſe. On returning from airing the liter of the ſtable ſhould be freſh, and by ſtirring this, and whiſking, he will be brought to ſtale. Then he is to be led to his ſtall, and tied up, and again carefully rubbed down; then he ſhould be covered with a linen cloth next his body, and a canvas one over that, made to fit him, and reaching down to his legs. This, as the duke of Newcaſtle obſerves, is a cuſtom which we learnt of the Turks, who are of all people the moſt nice and careful of their horſes. Over this covering there ſhould be put a body-cloth of ſix or eight ſtraps; this keeps his body in ſhape, and does not hurt him. This clothing will be ſufficient while the weather is not very ſharp, but in ſeverer ſeaſons, when the hair begins to riſe and ſtart in the uncovered parts, a woollen cloth is to be added, and this will always prove fully ſufficient.

Different horſes and different ſeaſons, make variety of the degree of cloathing neceſſary; but there always is an obvious rule to point out the neceſſary changes, the roughneſs of the coat being a mark of the want of cloathing, and the ſmoothneſs of it a proof that the cloathing is ſufficient. Therefore if at any time the hair is found to ſtart, it is a notice that ſome farther cloathing is to be added.

If the horſe ſweat much in the night, it is a ſign that he is over fed, and wants exerciſe; this therefore is eaſily remedied. An hour or more after the horſe is come in from his airing, the groom ſhould give him a whiſp of clean hay, making him rat out of his hand; after this let the manger be well cleaned out, and a quartern of oats clean ſifted be given him. If he eats up this with an appetite, he ſhould have more given him; but if he is ſlow and indifferent about it, he muſt have no more. The buſineſs is to give him enough, but not to cloy him with food.

If the horſe get fleſh too faſt on this home feeding, he is not to be ſtinted to prevent it, but only his exerciſe increaſed; this will take down his fleſh, and at the ſame time gave him ſtrength and wind. After the feeding in the morning is over, the ſtable is to be ſhut up, only leaving him a little hay on his litter. He need be no more looked at till one o'clock, and then only rubbed down, and left again to the time of his evening watering, which is four o'clock in the ſummer, and three in the winter. When he has been watered, he muſt be kept out an hour or two, or more if neceſſary, and then taken home and rubbed as after the morning watering. Then he is to have a feed of corn at ſix o'clock, and another at nine at night; and being then cleaned, and his litter put in order, and hay enough left for the night, he is to be left till morning. This is the direction for one day, and in this manner he is to be treated every day for a fortnight, at the end of which time his fleſh will be ſo hardened, his wind ſo improved, and his mouth ſo quickened, and his gallop brought to ſo good a ſtroke, that he will be fit to put to moderate hunting. During the time that he is uſed to hunting, he muſt be ordered on his days of reſt exactly as he is directed for the fortnight when he is in preparation; but as his exerciſe is now greatly increaſed, he muſt be allowed a more ſtrengthening food, mixing ſome old ſplit beans at every feeding with his oats.

And if this is not found to be ſufficient, the following bread muſt be given; let two pecks of old beans, and one peck of wheat be ground together, and made into an indifferently fine meal; then knead it into dough with ſome warm water, and a good quantity of yeaſt; let it lie a time that it may riſe and ſwell, which will make the bread the lighter; then make it into loaves of a peck each, and let it be baked in a ſlow oven, that it may be thoroughly done without being burnt; when it is taken out of the oven, it muſt be ſet bottom upwards to cool; when it is one day old the cruſt is to be chipped off, and the crumb given him for food. When this is ready, he ſhould have ſome of it at leaſt once in the day; but it is not to be made the only food, but ſome feeds are to be of oats alone, ſome of oats and this bread, and ſome oats and beans mixed together. The making a variety

a variety in this manner, being the beſt of all methods of keeping up the appetite, which is often apt to fail.

The day before the horſe is to hunt, he muſt have no beans, becauſe they are hard of digeſtion, but only ſome oats with this bread; or if he will be brought to eat the bread alone, that will be beſt of all. His evening feed ſhould, on this day, be ſomewhat earlier than uſual; and after this he is only to have a wiſp of hay out of the groom's hand till he return from HUNTING.

HUNTING, the art, or act, of purſuing and chaſing beaſts of GAME.

In its general ſenſe, *hunting* includes the purſuit both of hairy and feathered game; but in its more proper and reſtrained ſignification, it is only applicable to beaſts of venery and chace.

F. de Launay, profeſſor of the French laws, has an expreſs treatiſe of *hunting*. We find, that, among the more civilized nations, as the Perſians, Greeks, and Romans, it always made one of their genteeler diverſions; and as to the wilder and more barbarous, it ſerved them with food and neceſſaries. The Roman juriſprudence, which was formed on the manners of the firſt ages, made a law of it; and eſtabliſhed it as a maxim, that as the natural right of things, which have no maſter, belongs to the firſt poſſeſſor, wild beaſts, birds, and fiſhes, are the property of him, whoever he be, that can firſt take them.

But the northern nations of barbarians who over-ran the Roman empire, bringing with them a ſtronger taſte for the diverſion; and the people being now poſſeſſed of other and more eaſy means of ſubſiſtence from the lands and poſſeſſions of thoſe they had vanquiſhed; their chiefs and leaders began to appropriate the right of *hunting*, and inſtead of a natural *right*, to make it a royal one. Thus it continues to this day; the right of *hunting*, among us, belonging only to the king, and thoſe who derive it from him.

And hence have ariſen all our laws and charters of the foreſt, laws and regulations for preſervation of the game, &c. See FOREST.

The *hunting* uſed by the ancients was much like that now practiſed for the rein deer; which is ſeldom *hunted* at force, or with hounds; but only drawn with a blood-hound, and foreſtalled with nets and engines.——Thus did they with all beaſts; whence a dog is never commended by them for opening, before he has diſcovered where the beaſt lies: hence, they were not in any manner curious as to the muſic of their hounds, or the compoſition of their kennel or pack, either for deepneſs, loudneſs, or ſweetneſs of cry, which is become a principal point in the *hunting* of our days.

Their huntſmen, indeed, were accuſtomed to ſhout and make a great noiſe, as Virgil obſerves in the third of his Georgics: *ingentem clamore premes ad retia cervum.* But that clamour was only to bring the deer to the nets laid for him.

The Sicilian way of *hunting* had ſomething in it very extraordinary.——The nobles or gentry being informed which way a herd of deer paſſed, gave notice to one another, and appointed a meeting; every one bringing with him a croſs-bow or long-bow, and a bundle of ſtaves ſhod with iron, the heads bored, with a cord paſſing through them all: thus provided, they came to the herd, and calling themſelves about in a large ring, ſurrounded the deer.——Then, each taking his ſtand, unbound his faggot, ſet up his ſtake, and tied the end of the cord to that of his next neighbour, at the diſtance of ten feet from one another.——Then taking feathers, dyed in crimſon, and faſtened on a thread, they tied them to the cord; ſo that with the leaſt breath of wind they would whirl round.——Which done, the perſons who kept the ſtands withdrew, and hid themſelves in the next covert.

Then the chief rangers entering within the line with hounds to draw after the herd, rouſed the game with their cry; which flying towards the line, were turned off, and ſtill gazing on the ſhaking and ſhining feathers, wandered about as if kept in with a real wall or pale.

The ranger ſtill purſued, and calling every perſon by name, as he paſſed by their ſtand, commanded him to ſhoot the firſt, third, or fifth, as he pleaſed; and if any of them miſſed, or ſingled out another than that aſſigned him, it was counted a grievous diſgrace.

By ſuch means, as they paſſed by the ſeveral ſtations, the whole herd was killed by the ſeveral hands.

Hunting is practiſed in a different manner, and with a different apparatus, according to the nature, genius, and address, of the particular beaſt which is the object thereof. Theſe beaſts are, the hart, hind, hare, boar, wolf, buck, doe, fox, marten, and roe; the five firſt whereof are denominated beaſts of the foreſt, or venery, *beaſts of ſtate*; and the five latter, beaſts of the field, or of chace, *campeſtres*.

The gentlemen, and maſters of the ſport, have framed a new ſet of terms, which may be called the *hunting language*; a little view or vocabulary whereof we ſhall here give the reader.

The terms, then, uſed for beaſts of venery and chace, as they are in company, are theſe: they ſay, a *herd* of harts, and all manner of deer; a *bevy* of roes; a *ſounder* of ſwine; a *rout* of wolves; a *richeſſe* of martens; a *brace* or *leaſh* of bucks, foxes, or hares; a *couple* of rabbets or conies.

There are alſo terms for their lodging: a hart is ſaid to *harbour*; a buck *lodges*; a roe *beds*; a hare *ſeats*, or *forms*; a coney *ſits*; a fox *kennels*; a marten *trees*; an otter *watches*; a badger *earths*; a boar *couches*.

Hence, to expreſs their diſlodging, they ſay, *unharbour* the hart: *roufe* the buck; *ſtart* the hare; *bolt* the coney; *unkennel* the fox; *tree* the marten; *raiſe* the otter; *dig* the badger; *rear* the boar.

The terms for their noiſe at rutting time are as follows: a hart *bellieth*, a buck *groaneth* or *grunts*; a roe *bellows*; a hare *beats* or *ſaps*; an otter *whines*; a boar *frames*; a fox *barks*; a badger *ſhrieks*; a wolf *howls*; a goat *rattles*.

Terms for their copulation: a hart or buck goes to *rut*; a roe goes to *tourn*; a bear goes to *brim*; a hare or coney goes to *buck*; a fox goes to *ebeſtre*; a wolf goes to *match* or *mate*; an otter *kaniſth* for his kind.

Terms for the footing and treading: of a hart we ſay, the *ſlot*; of a buck, and all ſallow deer, the *view*; of all deer, if on the graſs, and ſcarce viſible, the *ſoiling*; of a fox, the *print*; and of other the like vermin, the *footing*; of an otter, the *marks*; of a boar, the *track*: the hare, when in open fields, is ſaid to *form*; when the winds about to deceive the hounds, the *doubles*; when ſhe beats on the hard highway, and her footing comes to be perceived, the *pricketh*: in ſnow it is called, the *trace* of the hare.

The tail of a hart, buck, or other deer, is called the *ſingle*; that of a boar, the *wrethe*; of a fox, the *bruſh* or *drag*; and the tip at the end, the *chape*; of a wolf, the *ſtern*; of a hare and coney, the *ſcut*.

The ordure or excrement of a hart, and all deer, is called *fewmets* or *fewmiſhing*; of a hare, *crottles* or *crottling*; of a boar, *aſſers*; of a fox, the *billing*; and of other the like vermin, the *fnants*; of an otter the *ſpraints*. As to the heads of deer, ſomething has already been ſpoken under the article HEAD.

For their attire or parts thereof, thoſe of a ſtag, if perfect, are, the *bur*, the *pearls*, the little *knobs* on it, the *beam*, the *gutters*, the *antler*, the *ſur-antler*, *royal*, *ſur-royal*, and all at top, the *crotches*; of the buck, the *bur*, *beam*, *brow-antler*, *back-antler*, *advancers*, *palm*, and *ſpellers*.

If the croches grow in the form of a man's hand, it is called a *palmed head*. Heads bearing not above three or four, and the croches placed aloft, all of one height, are called *crowned heads*. Heads having double croches, are called *forked heads*, becauſe the croches are planted on the top of the like forks.

They ſay a *litter* of cubs; a *neſt* of rabbets; a *ſquirrel's drey*.

The terms uſed in reſpect to the dogs, &c. are as follow: of greyhounds, two make a *brace*: of hounds, a *couple*; of grey-hounds, three make a *leaſh*: of hounds, a *couple* and *half*: they ſay, *to ſlip* a grey-hound; and *caſt off* a hound: the ſtring wherein a grey-hound is led is called a *leaſh*; and that of a hound a *lyome*: the grey-hound has his *collar*, and the hound his *couples*: we ſay a *kennel* of hounds, and a *pack* of beagles.

Hunting conſidered as an exercife, is perhaps the beſt that can poſſibly be contrived for ſtrengthening the general habit, and procuring health and vigour. The ſeaſon of the year, the time of the day deſtined for this amuſement, and the motion neceſſary on this occaſion, are all admirably adapted to the reſtoration and continuance of health. It is beſides of no ſmall importance to have the mind recreated at the time the body is exerciſed; for this admirably aſſiſts the due circulation of the fluids through the minute canals deſtined for their conveyance; and there are few people not utterly abandoned to idleneſs and debauchery of ſome kind or other, who do not perceive a ſpontaneous flow of ſpirits when they ride at or about the riſe of the ſun, when they reſpire the pureſt air, when variety of perpetually changing ſcenes preſent themſelves, and when the mind is agreeably agitated concerning the event of the chace.

HUNTING, *ſtyles or manners of*, are various, according to the country, the beaſt, and the means whereby he is to be caught.

Hunting,

Hunting, as practiſed among us, is chiefly performed with dogs; of which we have various kinds, accommodated to the various kinds of game: as *hounds*, *greyhounds*, *flaunch-hounds*, *blood-hounds*, *terriers*, &c. See HOUND.

In the kennels or packs, they generally rank them under the heads of *enterers*, *deſterers*, *ſpiers*, *ſpurs*, &c.

On ſome occaſions, nets, *ſpears*, and inſtruments for digging the ground are alſo required: not is the *huntſman* born to be muzzled.

The uſual chaces among us are, the *boar*, *buck*, *roe*, *hare*, *fox*, *badger*, and *otter*. We ſhall here give ſomething of what relates to each of theſe.

With regard to the ſeaſons of *hunting*, hart and buck *hunting* begins at the end of fence-month, which is a fortnight after Midſummer, and laſts till Holy-rood-day. The hind and doe come in courſe on Holy-rood-day, and laſt till Candlemas. FOX *hunting* comes in at Chriſtmas, and holds till Annunciation.

ROE *hunting* begins at Michaelmas, and ends at Candlemas. HARE *hunting* commences at Michaelmas, and goes out at the end of February. Where the wolf and boar are *hunted*, the ſeaſon for each begins at Chriſtmas; the firſt ending at the Annunciation, the ſecond at the Puſification.

Here, too, is the place for ſome general terms, and phraſes, more immediately uſed in the progreſs of the ſport itſelf; what belongs to the general ſorts of game in particular, being reſerved for the reſpective articles.

When the hounds then being caſt off, and finding the ſcent of ſome game begin to open and cry, they are ſaid to *challenge*; when they are too buſy before the ſcent be good, they are ſaid to *babble*; when too buſy where the ſcent is good, to *hound*; when they run it end-ways orderly, holding in together merrily, and making it good, they are ſaid to be in *full cry*; when they run along without opening at all, it is called *running mute*.

When ſpaniels open in the ſtring, or a grey-hound in the courſe, they are ſaid to *ſtep*.

When beagles bark and cry at their prey, they are ſaid to *trow*.

When the dogs hit the ſcent the contrary way, they are ſaid to *draw amiſs*.

When then they take freſh ſcent, and quit the former chace for a new one, it is called *hunting change*.

When they hunt the game by the heel or track, they are ſaid to *hunt counter*.

When the chace goes off, and returns again, traverſing the ſame ground, it is called *hunting the fall*.

When the dogs run at a whole herd of deer inſtead of a ſingle one, it is called *running riot*.

Dogs ſet in readineſs where the game is expected to come by and caſt off after the other hounds are paſſed, are called a *relay*. If they be caſt off before the other dogs be come up, it is called a *trundle*.

When, finding where the chace has been, they make a profier to enter, but return, it is called a *bimſo*.

A leſſon on the horn to encourage the hounds, is named a *cal* or *reſſaut*. That blown at the death of a deer, is called the *mot*. The *parts* belonging to the dogs of any chace they have killed, *in the reward*. They ſay, *take off a deer's ſkin*; *ſtrip a hare*, *fox*, and all ſorts of vermin; which is done by beginning at the ſnout, and turning the ſkin over the ears, down the tail.

HUNTING, *how reclaimed to*. See GAME.

Notwithſtanding all the game laws, and the various qualifications for *hunting* pointed out by ſtatutes, which imply a power for perſons ſo qualified to *hunt*, yet, according to judge Blackſtone, no man but he who has a chace, or free-warren by grant of the crown or preſcription, which ſuppoſes one, can juſtify *hunting* or ſporting upon another man's ſoil; nor indeed, in thorough ſtrictneſs of common law, either *hunting* or ſporting at all. Perſons ſo *hunting* are liable to actions of treſpaſs by the poſſeſſors of the land. Comment. vol. ii. p. 418. and vol. iv. p. 174.

HUNTING, *Badger*. A badger is called by ſeveral names, viz. a *grey brock*, *borſhin*, or *bourſhin*: the male is called a *badger* or *barrow-pig*, and the female a *ſow*. See BADGER. This beaſt is very frequent in Italy, Sicily, the Alpine, and Helvetian coaſts; and is not uncommon in France and England.

The badger is a very ſleepy beaſt, eſpecially in the daytime, ſeldom ſtirring abroad but in the night; whence the denomination *lucifuga*, q. d. *avoiding the light*. It burrows under-ground like the fox, and forms ſeveral different apartments, though with only one entrance, carrying in its mouth graſs in order to form a bed for its young. It is ſo cleanly an animal, that it never obeys the call of nature in its apartments, but goes out for that purpoſe. It breeds only once in a year, and brings four or five at a time.

The badger is a deep-biting beaſt, having very ſharp teeth; to guard againſt the effects whereof, it is uſual to put great braſs collars about the dogs necks. He fights on his back, and by this means is at liberty to uſe both his teeth and nails. He has a faculty of blowing up his ſkin after a ſtrange manner, by which he defends himſelf againſt any blow or bite of the dogs; ſo that you may threſh on his back till you are weary to no purpoſe: but a ſmall ſtroke on the noſe diſpatches him preſently. The ſkin of the badger when dreſſed with the hair is uſed for piſtol furniture. The Highlanders make their purſe-daut pouches of it. The hair is often uſed for making bruſhes to ſoften the ſhades in painting, called ſweetening tools. Theſe animals are alſo hunted in the winter nights for the ſake of their fleſh, for the blind quarters may be made into hams, not inferior in goodneſs to the beſt bacon. The fat is much valued for ointments and ſalves.

The method of *hunting* the badger is this: ſeek the earth and burrows where he lies, and in a clear moonſhine night go and ſtop all the holes but one or two, and therein place ſacks, faſtened with drawing-ſtrings, which may ſhut him in as ſoon as he ſtrains the bag. The bags thus ſet, caſt off your hounds, and beat all the groves, hedges, or tufts, within a mile or two: what badgers are abroad, being alarmed by the dogs, will ſtraight repair to their earths, and ſo be taken. Be that ſtays to watch the ſacks muſt ſtand cloſe, and upon a clear wind; or elſe the badger will find him, and fly ſome other way for ſafety. If the hounds either encounter him, or undertake the chace before he can get into his earth, he will ſtand at bay like a boar, and make excellent ſport.

If the badger be attacked in his earth, as ſoon as he perceives the terriers yearn him, he will ſtop the hole between the dogs and himſelf; and if the dogs continue baying he removes his baggage with him, and goes into another apartment or chamber, of which he uſually has half a dozen in the burrow; thus retreating from one to the other, till he can go no farther, and barricading the way as he goes. In *hunting* the badger as well as the fox, a man cannot juſtify breaking the ſoil, and digging him out of his earth.

HUNTING, *Buck*, or *hunting fallow deer*. See BUCK.

The female is called *doe*, or *doe* the firſt year, a *fawn*; ſecond, a *pug*; the third, a *doe*. See DEER.

This beaſt is common in moſt countries, being as corpulent as a hart, but in moſt things reſembling more a roe, except in colour; which is various, but moſt commonly branded, or ſpotted on the back, having a black liſt all along on the ridge, and the belly and ſides ſpotted with white.

The male has horns not much differing from a hart, except in largeneſs, and they grow out of the head like fingers out of the hand; whence it is called *cervus palmatus*. The female is without horns.

Leſs art and ſkill are required in lodging a buck than in harbouring a hart; nor does there need ſo much drawing after: it is ſufficient that you judge by the view, and mark what grove or covert he enters; for he does not wander and rove ſo often as a hart, nor ſo frequently change his layer. When hard hunted he uſually takes to ſome ſtrong hold or covert, with which he is acquainted; not flying far before the hounds, nor croſſing nor doubling, nor uſing any of the ſubtleties the hart is accuſtomed to.

The buck will beat a brook, but ſeldom a great river as the hart; nor can he ſtay ſo long at ſoil.

The greateſt ſubtlety a huntſman need uſe in *hunting* the buck is to beware of *hunting* counter or change, becauſe of the plenty of fallow deer, which are to come more directly upon the hounds than the red deer do.

The buck herds more than the hart, and lieth in the drieſt places; but if he be of large, uncombined in a park, he herds but little from May to Auguſt, becauſe the flies trouble him. He takes delight in hilly places, but chooſes the dales to feed in.

HUNTING, *fox*. This animal, the firſt year, is called a *cub*; the ſecond, a *fox*; the *third*, an *old fox*. See FOX. His nature in many reſpects is like that of a wolf; and both bring the ſame number of cubs at a litter: but the fox litters deep under ground, which the wolf does not.

A bitch fox is hard to take when dragged and with cub, in regard ſhe lies near her burrow, into which ſhe runs upon hearing the leaſt noiſe: indeed it is no eaſy matter to take her at any time, as being a beaſt of exceeding ſubtlety. What makes *fox-hunting* the more entertaining is, the ſtrong hot ſcent this creature affords, which keeps up an excellent cry; but as his ſcent is hotter at hand, ſo it dies ſooner than that of a hare, &c. Add, that he never flies far before the hounds, as not truſting to his legs, or the champaign ground, but has recourſe to the ſtrongeſt co-

vers. When he can no longer ſtand up before the hounds, he takes earth, and muſt be dug out. When courſed by grey-hounds on a plain, his laſt refuge is, uſually, to piſs on his tail, and ſlap it in their faces as they come near him; ſometimes ſquirting alſo his thicker excrement upon them, to make them give over their courſe.

When a bitch fox goes a clicketing, and ſeeks the dog, ſhe cries with a hollow voice, not unlike the howling of a mad dog; and the like noiſe ſhe makes when ſhe miſſes any of her cubs; but ſhe never cries at all when ſhe is about to be killed, but defends herſelf in ſilence to the laſt gaſp.

The fox is taken with hounds, grey-hounds, terriers, nets, and gins. Of terriers there are two ſorts: the one crook-legged, and commonly ſhort-haired, which take earth well, and lie long at fox, or badger; the other is ſhagged, and ſtrait-legged, which will not only hunt above ground as others, but alſo enter the earth with great fury, though theſe cannot ſtay in ſo long, on account of their vehemence.

The fox chuſes to earth in ground hard to dig; as in clay, or ſtoney ground, or amongſt the roots of trees; and his earth has commonly but one hole, which goes ſtrait along in, before it comes at their couch: he ſometimes by craft poſſeſſes himſelf of a badger's old burrow, which has variety of chambers, holes, and angles. Geſner relates, that he frequently cheats the badger of his habitation, by laying his excrement at the mouth of the other's burrow.

HUNTING, *hare*. A hare the firſt year is called a *leveret*; the ſecond year, a *hare*; the third, a *great hare*. See HARE.

Thoſe of the mountains are the moſt ſwift, and thoſe of the marſhes the ſloweſt; the wandering hares are the moſt difficult and dangerous to follow.

Each part and member of the hare is formed for celerity. The head is round and ſhort, of a convenient length; the ears long and lofty, to hear the enemy at a diſtance, and ſave itſelf in time; the lips continually move, ſleeping and waking; and the eye is too big and round for the lid to cover it, even when aſleep; ſo that the creature ſleeps as it were on the watch. The breaſt is capacious, and fitted to take more breath than that of any other beaſt. They feed abroad, to conceal their forms; and never drink, but content themſelves with the dew. The hare's ears lead the way in her chace; for with one of them ſhe hearkeneth to the cry of the dogs, the other being ſtretched forth like a ſail to promote her courſe.

The hares of the mountains often exerciſe themſelves in valleys and plains, and through practice grow acquainted with the neareſt way to their forms: thoſe which frequent buſhes and brakes, are not able to endure labour; nor are very ſwift, being tender-footed, and growing fat through diſcontinuance of exercize.

When the hare has left the dogs far behind, ſhe goes to ſome hill or riſing-ground, where, rearing on her hinder legs, ſhe obſerves at what diſtance her purſuers are.

The ſcent is naturally ſtronger in wood-hares than field-hares; but in all ſorts it is ſtrongeſt when they feed on green corn. In winter mornings, the ſcent does not lie till the froſt be a little thawed: and it may be added, that a hare always leaves more ſcent when ſhe goes to relief, than when ſhe goes to form.

Her footſteps are more ſeen in winter than ſummer; becauſe as the nights are longer, they travel farther. Their prints are very uncertain at the full moon, at which time they leap and play together. The young, it is to be obſerved, tread heavier than the old, becauſe their limbs are weaker. A buck, or male hare, is known by his bearing the hard highways, feeding farther out in the plains, and making his doublings of a greater compaſs than the female, who keeps cloſe by ſome covert ſide; turning, winding, and croſſing in the buſhes, like a coney, and rarely running out an end; whereas the buck, having once made a turn or two about his form, then farewel turns; for he will frequently lead them five or ſix miles without once turning his head. Add, that the buck is known, at his riſing out of form, by his hinder parts, which are more white, and his ſhoulder, which is redder than the doe's.

The hare regulates its conduct according to the weather. In a moiſt day ſhe holds the highways more than at any other time, becauſe the ſcent is then moſt apt to lie; and if ſhe come at the ſide of any young grove or ſpring, ſhe forbears to enter, but ſquats down aſide thereof, till the hounds have overſhot her; upon which ſhe returns the ſame way ſhe came, without turning into any covert, for fear of the wet and dew hanging on the boughs.

Regard is alſo to be had to the place where the hare ſits, and upon what wind; for if her form be either upon the north or ſouth wind, ſhe will not willingly run into the wind, but aſide, or down the wind: on the contrary, if ſhe form in the water, it is a ſign ſhe is foul and meaſled; and in the courſe will make all her doubling and croſſing about brook-ſides, and near plaſhes; for her ſcent, under this condition, being very ſtrong, ſhe needs a place that will take but little. Sometimes, when hunged down, ſhe will ſtart a freſh hare, and ſquat in the ſame form; at other times ſhe will creep under the door of a ſheep-cote, and hide among the theep, or run among a flock of ſheep, and will not, without the utmoſt difficulty, be taken from among them. Alſo, that ſome will take the ground like a coney: this is called going to *vaut*.

Some hares will go upon one ſide of the hedge, and come down the other; and we have known a hare, that, being ſorely hunted, has got upon a quickſet hedge, and ran a good way on the top thereof, and then leaped off upon the ground; and it is no unuſual thing for them to take themſelves to furz-buſhes, and leap from one to another, whereby the hounds are frequently in default.

A hare, it is ſaid, does not live above ſeven years at moſt, eſpecially the buck; and if he and the doe keep one quarter, they will not ſuffer any ſtrange hare to ſit by them; whence the proverb, "The more you hunt, the more hares you ſhall have;" ſince, having killed one hare, another comes and poſſeſſes his form. By the way it is to be obſerved, that to enter a young kennel of hounds, regard muſt be had to the nature of the country, and of the quarry: for according to the place wherein they are entered, and the game firſt given them, will they afterwards prove. Thus if they be entered in a champaign country, they will ever after more delight to hunt there than on any other ground.

Having found where a hare hath relieved in ſome paſture, or corn-field; to find her form, the ſeaſon of the year and the ſtate of the weather are to be conſidered. In the ſpring, or ſummer, a hare will not ſit in the buſhes, becauſe frequently offended with piſmires, ſnakes, and adders; but will ſit in corn-fields, and open places. In winter they chooſe to ſit near towns and villages, in tufts of thorns and brambles, eſpecially when the wind is northerly or ſoutherly. According to the ſeaſon, and nature of the place where the hare is accuſtomed to ſit, there beat with your hounds, and ſtatt her; which is better ſport than trailing of her from her relief to her form. Having ſtarted her, ſlep in, and hallow in the hounds till they have undertaken it; crying, *that, that, or there, there*, and go on with full cry; then recheat them, and follow at a diſtance, taking care not to forward them too much at firſt, as being apt, if the firſt heat, to overſhoot the game. Above all things, mind the firſt doubling the hare makes, which is to be a key or direction for the whole day; all the other doublings ſhe afterwards makes being like the firſt. According to the policies you ſee her uſe, and the place where you hunt, make your compaſs, to help the defaults, great or ſmall, long or ſhort; always ſeeking the moiſteſt and moſt commodious place for the hounds to ſcent in.

HUNTING, *hart*, or HUNTING *of red deer*. This animal the firſt year is called a *calf*, or *hind-calf*; the ſecond year, a *knobber*; the third, a *brock*; the fourth, a *ſtaggard*; the fifth, a *ſtag*; the ſixth, a *hart*.

The female is called a *hind*. The firſt year ſhe is *calf*; the ſecond, a *bearſe*, and ſometimes a *brocket's ſiſter*; the third, a *hind*.

Terms occurring more eſpecially in *hunting* the hart, and not yet explained, are as follow. The print, or impreſſion, where a deer has lain, is called a *layer*: if it be in covert, or a thicket, it is called his *harbour*; where a deer has paſſed into a thicket, leaving marks whereby his bulk may be gueſſed at, it is called an *entry*; when they caſt their heads, they are ſaid to *mew*; when they rub their heads againſt trees, to bring off the peels of their horns, they are ſaid to *fray*; when a deer hard hunted, takes to ſwimming in the water, ſhe is ſaid to go to *ſoil*; when they turn head againſt the hounds, they are ſaid to *bay*; when the hounds touch the ſcent, and draw on till they put up the hart, they are ſaid *to draw on the ſlot*.

As to the nature and qualities of the hart, it is to be obſerved, that he is an excellent ſwimmer; there being inſtances, when ſore hunted, of his plunging in the ſea, and being killed by fiſhermen twelve miles from land. When, in going to run, they have occaſion to croſs a great river, or arm of the ſea, it is ſaid they aſſemble in great herds; the ſtrongeſt goes in firſt, and the reſt of ſtrength follows: and ſo one after the other, relieving themſelves by ſtaying their heads on the buttocks of each other.

The hind commonly carries her calf eight or nine months, which uſually falls in May: ſome have two at once; and they always eat up the ſkin wherein the calf lay. As the young grow up, the old one teacheth it to run and leap, and how to defend itſelf from the hounds.

The hart is amazed at hearing any one call, or whiſtle,

in his fit: if you ery *mare, stand*, or *take heed*, you will see him instantly turn back, and make some little stand. His sense of hearing is very perfect when his head and ears are erected; but very imperfect when he holds them downy hence, when he pricks up his ears, he is known to be apprehensive of danger. When he is at soot, and not afraid, he wonders, and takes a pleasure to gaze at every thing he sees.

The hart is very long lived, commonly reaching to a hundred years, or upwards. The principal marks of his age are taken from his head, yet this is somewhat precarious; some having more croches thereon at the same age than others. Those are accounted to excel in beauty of horns, which bear them high: though solid throughout as stones, yet, if they remain a while in the air, they grow very light and friable, discovering themselves to be no other than an earthy substance, concrete and hardened with a strong juice into the form of bones.

The horns being fallen, they retire, and hide themselves in the shade, to avoid the annoyance of flies, and only come out to feed in the night. Their new horns appear, at first, like bunches, very soft and tender; but by the increase of the sun's heat, they at length grow harder, and are covered with a tough skin, called a *velvet head*. As that skin dries, they eafily try the strength of their new heads upon trees, which not only burnishes and scrapes off the roughneſs, but by the pain they feel hereby, admoniſhes them how long to forbear the company of their fellows; for when the horns grow inſenſible, they return to their former condition.

The taking of this beaſt requires great art and attention. When the hunter goes for ſport, he is firſt to encompaſs the beaſt *en ſang gyſte*, in her own layer, and thus unharbour her in the view of the dogs, ſo they may never loſe her ſlot or footing. But note, a deal of choice and diſcretion is here required; for he may not ſet off upon every one, either of the herd, or thoſe which wander ſolitary: the young, the ſmall, &c. are to be paſſed over; and partly by ſight, and partly by the footing, ſewmets, the largeneſs of the layer, &c. he muſt make judgment of the game, ſingling out for that purpoſe the largeſt head in the whole herd.

There are divers means for knowing an old hart: viz. by the *ſlot*, the *entries*, the *abatures* and *foils*, the *fumets*, *gait* and *voults*, *fraying-poſts* and the *head* and *branches*.

1. As to the *ſlot*. The treadings of the hart's ſoot are to be carefully noted: if you find the treadings of two, the one long, and the other round, yet equally big, the longeſt ſlot declares the largeſt hart; add, that the old hart's hind-ſoot never over-reaches the fore-ſoot, as that of the young ones does. 2. The ſewmiſhing is chiefly to be judged of in April or May: if it be large and thick, it ſignifies the hart to be old. 3. To know the height and thickneſs of the hart, obſerve his entries and galleries into the thickets; and what boughs he hath over-ſtrided, and mark from thence the height of his belly from the ground; for a young deer uſually creeps low, as he paſſes to his harbour, and goes through places which the old one, being ſtiff and ſtately, will not ſtoop to.

4. By his gait it may be known whether the hart be large, and whether he will ſtand long before the hounds: if he have a long ſtep, he will ſtand long, being ſwift, light, and well breathed; if he have a great ſlot, which is the ſign of an old deer, he will be a laſter. As to his fraying-poſt, note, that the older the hart is, the ſooner he goeth to fray, and the greater is the tree he chooſes to fray upon; it being neceſſary it be ſuch as may not bend. Now, to ſeek or find out a hart in his haunt, or feeding-place, it is to be obſerved, that he changes his manner of feeding every month. From the concluſion of the rutting time, which is in November, they feed in heaths and broomy places. In December they herd together, and withdraw into the ſtrength of the foreſts, to ſhelter themſelves from the ſevere weather, feeding on holm-trees, elder-trees, brambles, &c. The three following months they leave the herding, but keep four or five in a company, and in the corners of the foreſt will feed on the winter paſture; ſometimes making their excurſions into the neighbouring corn-fields, if they can perceive the blades of wheat, rye, &c. appear above ground. In April and May they reſt in thickets and ſhady places, ſtirring very little till rutting time, unleſs diſturbed. The three ſucceeding months they are in their pride of greaſe, and reſort to ſprings, copſes, and corn-fields. In September and October they leave the thickets, and go to rut; during which ſeaſon, they have no certain place either for food or harbour.

Having found out the game, the *hunters* diſcouple and caſt off the dogs; and ſome on horſeback, others on foot, follow the cry with the utmoſt art, obſervation, and ſpeed, remembering and preventing the ſubtle turning and headings of the hart; ſtanding with dexterity and intrepidity to leap hedge, pales, ditch, &c.

The utmoſt addreſs and circumſpection are to be uſed to keep to the beaſt firſt attempted, and to prevent the dogs from purſuing any other: this, in effect, makes one of the principal difficulties and glories of the chace; the beaſt having a hundred devices to put off ſome other head for his own: ſometimes he will ſend forth ſome other little deer in his ſtead into the dogs way, laying cloſe the while himſelf; on which occaſion the huntſman is to found a retreat, and break off the dogs, and take in leam, till the game be recovered.

Sometimes he will purpoſely ſeek out other deer at layer, and rouſe them to make the hounds hunt change, himſelf lying down flat in ſome of their layers upon his belly, to make the hounds over-ſhoot him: add, that they may neither ſcent nor vent him, he will gather up his fore-feet under his belly, and blow or breathe on ſome moiſt place of the ground, ſo that the hounds ſhall paſs within a yard without apprehending him. He will break into one thicket after another, to find deer, rouſing, gathering them together, and herding with them, and even beating ſome of them into his treads, that he may the more eaſily eſcape. Finding himſelf ſpent, he will break herd, and fall to doubling and croſſing in ſome hard beaten highway, always running againſt the wind, not only to cool himſelf, but the better to hear the voice of his purſuers.

The laſt refuge of a hart ſorely *hunted*, is the ſoil; keeping the middle, for fear, leaſt by touching a bough, or the like, he may give ſcent to the hounds. He always ſwims againſt the ſtream; whence the old rule, "He "that will his chace find, let him try up the river, and "down the wind." In taking ſoil he will ſometimes cover himſelf under water, ſo as to ſhew nothing but his noſe. Where opportunity of water faiſs, he will fly into herds of cattle, as cows, ſheep, &c. and will ſometimes leap on an ox, cow, or the like, laying the fore part of his body thereon, that ſo touching the earth with his hinder feet, he may leave a ſmall or no ſcent behind. What is farther ſtill, the chief huntſman of Lewis XII. relates, that a hart which they were in hard chace of, leaped into a great tall white thorn, which grew in a ſhadowy place, and there ſtood aloft till he was run through by a huntſman, rather than he would ſtir.

The hart being killed, the huntſman with his horn winderh the faſt of the beaſt; upon which every one approacheth: the ſkilfulleſt opens the beaſt, rewarding the hounds with what properly belongs to them; the huntſman, at the ſame time, dipping bread in the ſkin and blood of the beaſt to give the hounds their full ſatisfaction.

The hart is known to be ſpent by his running ſtiff, high, and lampering; by his mouth being black and dry, without foam on it, and his tongue hanging out: though he will ſometimes cloſe his mouth to deceive the ſpectators; and by his ſlot, for he will ſometimes cloſe his claws together, as if he were at leiſure, and ſtrait again open them wide, making great gliddings, and hitting his dewlaps upon the ground, &c. When quite ſpent, and cloſe beſet, or, intercepted on all ſides, the hart uſually takes to bay, and makes force with his head againſt the firſt man or dog that cloſes in upon him, unleſs prevented with a ſpear, ſword, or the like. Hence it is very dangerous going into a hart at bay, eſpecially at rutting time, for then they are more than ordinarily fierce.

The hart being killed, his death is ſolemnized with great ceremony. The firſt thing, when the huntſmen come in, is to cry, *Hare haunch*, that the hounds may not break in to the deer: having ſecured this, they cut his throat, and blood the younger hounds, to make them love deer, and learn to leap at his throat; then having blown the mort, and all the company being come in, the moſt diſtinguiſhed perſon, who has not taken *ſoy* before, takes up the knife, and lays it across the belly of the deer (ſome of the aſſiſtants holding by the fore-legs, and at the ſame time the huntſman drawing down the pizzle) and thus he draws the knife along the middle of the belly, beginning near the briſket, cutting deep enough, to diſcover how fat he is. Then the moſt faithful perſon breaks up the deer, by firſt ſlitting the ſkin from the cuttings of the throat downwards, making the arber, that the ordure may not break forth, and then paunching him, and rewarding the hounds therewith.

Laſtly, the perſon that took the *ſoy*, being preſented with a drawn hanger, he is to cut off the head; which done, and the hounds rewarded therewith, the concluding ceremony, if a buck, is a double; if a ſtag, a treble mort blown by one, and a conſort in concert by all that have horns: the whole is then concluded with a general *whoo whoop*.

HUNTING, *otter*. See OTTER.

The otter is to be hunted by particular dogs, called *otter-hounds*, and alſo with ſpecial inſtruments, called *otter-ſpears*. To find him out, ſome are to go on one ſide of the

the river, and some on the other, bearing all the way on the banks, with the dogs following. Thus it is soon found if there be an otter in that quarter; for the otter cannot endure long in the water, but must come forth to make his sprainis, and in the night sometimes to feed on grass, and other herbs. If the hounds find an otter, look in the soft and moist places, to learn by the prints which way he bent his head: if these make no discovery, it may be partly perceived by the sprainis. This done, follow the hounds, and lodge him as a hart or deer.

The otter always endeavours to keep to the water, where he is master. In *hunting* him therefore, you are to be ready with your spears, to watch its vents; for that is the chief advantage: if you perceive where he swims under water, strive to set a stand before him, where you expect he will vent, and there endeavour to strike him with the spear: if you miss, pursue him with the hounds; which, if they be good, and well entered, will even chaunting and trailing along the river-side, and beat every tree, root, every otter-bed, and tuft of bulrushes; nay, sometimes, they will take the water, and beat it like a spaniel; by which means the otter can hardly escape.

If the beast find himself wounded with a spear, he usually makes to land, where he will maintain a furious battle with the dogs.

HUNTING, *roe-buck*. See ROE-BUCK, and *Roe*-DEER.

We have no roe-deer in England; but they abound in the Highlands of Scotland, Germany, Africa, &c. And it should seem that they have been more common among us, our huntimen still retaining the proper terms for the chace.

They make good chace, stand long, and fly end-way. When a roe crosses and doubles, *it is* called *trapping*.

Their swiftness appears not only on the earth, but in waters, through which they cut their way as with oars; whence they love lakes and streams, breaking the floods to come at fresh pasture, feeding on rushes, &c.

Horns grow only on the male; being set with six or seven branches not palmed, but branchy, yet shorter than fallow deer. After rutting he casts his head.

They are said never to wink, not even when asleep; for which conceit their blood is by some fanciful people prescribed to persons dim-sighted or purblind. The tail of this beast is less and shorter than that of a fallow-deer, insomuch that it is questioned whether it ought to have that denomination.

They keep mostly in mountains among the rocks; and when hunted, Martial tells us, will hang thereon with their horns, to delude the dogs. They are often taken by counterfeiting their voice, which the huntsman does by the assistance of a leaf in his mouth.

When hunted, they turn much and often, and will come back on the dogs directly, when they can no longer endure. They also take soil, as the hart; and will sometimes hang by a bough in such a manner, as that nothing shall appear but their snout.

HUNTING *match*. The first thing that is to be considered by one who designs to match his horse for his own advantage, and his horse's credit, is not to flatter himself with the opinion of his horse, by fancying that he is a swift, when he is but a slow gallopper; and that he is a whole running horse (that is, that he will run four miles without a fob at the height of his speed) when he is not able to run two or three. Very probably some gentlemen are led into this error, by their being mistaken in the speed of their hounds, who, for want of trying them against other dogs that have been really fleet, have supposed their own to be so, when, in reality, they are but of a middling speed; and because their horse, when trained, was able to follow them all day, and upon any hour, to command them upon deep as well as light earths, have therefore made a false conclusion, that their horse is as swift as the best; but upon trial against a horse that has been rightly trained after hounds that were truly fleet, have bought their experience perhaps full dear: therefore it is adviseable for all lovers of *hunting* to procure two or three couple of tried hounds, and once or twice a week to follow after them a train-scent, and when he is able to top them on all sorts of earth, and to endure heats and colds stoutly, then they may better rely on his speed and toughness.

That horse which is able to perform a hare-chace of five or six miles briskly and courageously, till his body be as it were bathed in sweat; and then, after the hare has been killed, in a nipping frosty morning, can endure to stand till the sweat be frozen on his back, so that he can endure to be pierced with the cold as well as the heat, and then even in that extremity of cold to ride another chace as briskly and with as much courage as he did the former, that horse which can thus endure heats and colds is most valued by sportsmen. Therefore, in order to make a judgment of the goodness of a horse, observe him after the death of the first hare. If the chace has been in any degree brisk; if when he is cool, he shrinks up his body, and draws his legs up together, it is an infallible sign of want of vigour and courage: the like may be done by the slackening of his girths after the first chace, and from the dulness of his teeth, and the dulness of his countenance, all which are true tokens of faintness, and being tired; and such a horse is not to be relied on, in case of a wager.

Here it will not be improper to take notice of the way of making matches in former times, and the modern way of deciding wagers. The old way of trial was, by running so many train-scents after hounds, as were agreed upon between the parties concerned, and a bell-course, this being found not to uncertain, but more durable than hare-hunting; and the advantage consisted in having the terms laid on earth most suitable to the qualifications of the horses. But now others choose to hunt the hare till such an hour, and then to run this wild-goose-chace, a method of racing that takes its name from the manner of the flight of wild geese, which is generally one after another; so the two horses after running of twelve-score yards, had liberty, which horse soever could get the leading, to ride what ground he pleased, the hindmost horse being bound to follow him, within a certain distance agreed on by articles, or else to be whipped up by the triers or judges which rode by; and whichever horse could distance the other, won the match.

But this choice was found by experience so inhuman and so destructive to good horses, especially when two good horses were matched; for neither being able to distance the other, till both were ready to sink under their riders through weakness, that circumstances the match was fain to be drawn, and left undecided, though both the horses were quite spoiled.

This brought up the custom of train-scents, which afterwards was changed to three hours, and a straight course; and that the lovers of horses might be encouraged to keep good ones, plates have been erected in many places of England. The fewer of these before you come to the course, if your horse be fiery and mettled, the better, and the shorter the distance the better. Also, above all things, be sure to make your bargain to have the leading of the first train, and then make choice of such grounds where your horse may best show his speed, and the fleetest dogs you can procure: give your hounds as much law before you as your triers will allow, and then, making a loose, try to win the match with a wind; but if you fail in this attempt, then beat your horse, and save him for the course; but if your horse be slow, but well winded, and a true spurred nag, then the more train-scents you run before you come to the straight course, the better. But here you ought to observe to gain the leading of the first train; which in this case you must lead upon such deep earths, that it may not end near any light ground; for this is the rule received among horsemen, that the next train is to begin where the last ends, and the last train is to be ended at the starting-place of the course; therefore remember to end your last on deep earths, as well as the first.

HUNTING *saddle*. See SADDLE.

HURA, in *Botany*. See *Sand* BOX-*tree*.

HURDLE is the name of the sledge used to draw traitors to the place of execution.

HURDLES, in *Fortification*, twigs of willows or osiers, interwoven close together, in the form of a long square, five or six feet long, and three or three and a half broad, sustained by strong stakes, and usually laden with earth. *Hurdles*, called also CLAYES, serve to render batteries firm, to consolidate the passage over muddy ditches, and cover traverses, and lodgments for the defence of the workmen against the artificial fires or stones that may be cast upon them.

HURDLES, in *Husbandry*, are frames made either of split timber or of hazel-rods, platted together, to serve for gates in inclosures, to make sheepfolds, &c.

HURDS, or HARDS *of flax or hemp*, the coarser parts, separated in the dressings from the neat or fine stuff. See HEMP and FLAX.

HURENHUTTERS, in *Ecclesiastical History*. See HERRNHUTERS.

HURLE *bone*, in a horse, is a bone near the middle of the buttock; very apt to go out of its sockets with a slip or strain.

HURLERS, a number of large stones, set in a kind of square figure near St. Clare, in Cornwall, so called from an odd opinion held by the common people, that they are so many men petrified, or changed into stones, for profaning the sabbath-day by *hurling* the ball, an exercise for which the people of that country have been always famous.

The *hurlers* are oblong, rude, and unhewed. Many authors

thors ſuppoſe them to have been trophies erected in memory of ſome battle; others take them for boundaries to diſtinguiſh lands. Laſtly, others, with more probability, hold them to have been ſepulchral monuments.

HURLY-*burly*, in *Vulgar Language*, denotes confuſion or tumult, and is ſaid to owe its origin to two neighbouring families, Hurleigh and Burleigh, which filled their part of the kingdom with conteſt and violence. Johnſon.

HURRERS, in our *Old Writers*. The cappers and hat-makers of London, formerly one company of the haberdaſhers, were called by this name.

HURRICANE, a furious ſtorm of wind, rain, thunder, and lightning, attended with a great ſwelling of the ſea, and ſometimes with an earthquake; and, in ſhort, with every circumſtance which the elements can aſſemble that is terrible and deſtructive.

Hurricanes are frequent in the Eaſt and Weſt Indies, making terrible ravages in the iſlands thereof; blowing down houſes, rooting up trees, and even whole woods, making caverns in the earth, and ſcattering earth, bricks, ſtones, timber, &c. to a great diſtance, in every direction. Great quantities of water have been left, or raiſed by them, ſo as to make a kind of deluge; and they have been always attended with a prodigious rumbling noiſe. As a prelude to the enſuing havock, whole fields of ſugar-canes are ſeen whirled into the air, and ſcattered over the face of the country; the ſtrongeſt trees of the foreſt are torn up by the roots, and driven about like ſtubble; their wind-mills are ſwept away in a moment; their works, their fixtures, the ponderous copper boilers and ſtills, of ſeveral hundred weight, are wrenched from the ground, and battered to pieces; the roofs of their houſes are torn off at one bluſt, whilſt the rain, which in an hour riſes five feet, ruſhes in upon them with an irreſiſtible violence.

They uſually begin in the north, ſome ſay the weſt, but turn round; and in a little time veer through all points of the compaſs.

Great miſchiefs are done to our veſſels about the Caribbee iſlands, and elſewhere, by means of the *hurricane*, and at the time of year when they are moſt frequent, which is in the midſt of ſummer, principally in the month of Auguſt, more rarely in July and September.

It is the cuſtom for the French and Engliſh inhabitants in the Caribbee iſlands, to ſend every year about June to the native Caribbees of St. Dominico and St. Vincent, to know whether there will be any *hurricanes* that year; and about ten or twelve days before any *hurricane* come, they conſtantly ſend them word.

The prognoſtics thoſe people go by, are given us by captain Langford, who, in 1697, engaged one of them, by civilities, to reveal them to him.

It is one of their principles, that all *hurricanes* come either on the day of the full, or of the change, or quarter of the moon; each of which is diſcovered by a number of phenomena in the preceding quarters, as a turbulent ſky, ſun red, univerſal calm, the ſtars appearing red, larger than uſual, and ſurrounded with a ſort of burr, noiſes in hollows or cavities of the earth, ſtrong ſwell of the ſea, which riſes into large waves, a ſettled weſterly wind, blowing, with intermiſſions, violently and irregularly, for about two hours at a time; and at the full of the moon, the moon itſelf is ſurrounded with a great burr, and ſometimes the ſun has the ſame appearance. That author aſſures us, he received this benefit from the information, that whereas *hurricanes* are ſo dreadful, that all ſhips are afraid to put out to ſea while they laſt, and chooſe rather to periſh at anchor in the roads, yet, with good management, he found, that a veſſel may be out at ſea, in theſe, as ſafely as in other ſtorms, by taking care the ports be well barred and caulked, the top-maſts and tops taken down, the yards a-port laſt, and the doors and windows ſecured. With theſe precautions that experienced navigator preſerved his veſſel in two great *hurricanes*, and taught others how to do the ſame, by putting out from port, where they would inevitably have periſhed. And from the prognoſtics above, he foretold ſeveral *hurricanes* at land.

He adds, that all *hurricanes* begin from the north, and turn to the weſtward, till arriving at the ſouth-eaſt, their force is ſpent.

The cauſe he ſuggeſts to be the ſun's leaving the zenith of thoſe places, and going back towards the ſouth; and the repelling or bounding back of the wind, occaſioned by the calming of the general trade-wind. Phil. Tranſ. N° 240.

It is obſervable, that the air is much colder during theſe *hurricanes* than at other times; but Ligon, and ſome others, fond of relating ſtrange ſtories, make it much more ſo than it really is, the ſailors who have been in theſe ſtorms declaring that they have felt no ſuch chilneſs as thoſe authors relate. The wind during the *hurricane* is ſo ſtrong, and varies ſo faſt between the north and the north-eaſt point, that it is impoſſible for any ſhip to anſwer the veerings of it; it is hence that all the art of the ſailors often cannot prevent the backs of the veſſels from being broken, and the maſts being carried by the board. The main-maſt of a ſhip of four hundred ton will be in an inſtant wreathed like a withe, and borne by the board before they can hand a ſail. Phil. Tranſ. N° 36.

Switzerland is ſubject to very violent *hurricanes*, which do great miſchief, and that in a very ſingular manner. Thunder and lightning are frequent with them in winter as well as in ſummer; and the more violent ſtorms of theſe, are ſometimes attended with whirlwinds and *hurricanes*, which will raiſe the water of ſome lakes in form of a thick pillar up to the cloud, and carrying on before the wind this vaſt body of water, will ſometimes fall in other places on dry land, and drown the houſes and gardens where it chances to fall.

Theſe are all phenomena of electrical origin, and depend on the ſame general cauſes. See ELECTRICITY, LIGHTNING, and SPOUT.

HURST, or HYRST, in our *Old Writers*, denotes a wood or grove of trees. Hence ſuch places as have this word for part of their names, have been ſituated near a wood. In Kent, Suſſex, and Hampſhire, there are many ſuch, becauſe formerly the great wood called Andreſwald, extended itſelf through theſe counties.

HURTER, in *Artillery*, a flatted iron fixed againſt the body of an axle-tree, with ſtraps, to take off the friction of the naves of wheels againſt the body.

HURTERS, in *Fortification*, denote pieces of timber about ſix inches ſquare, placed at the lower end of the PLATFORM, next to the parapet, to prevent the wheels of the gun-carriages from damaging the parapet.

HURTS, in *Heraldry*, by ſome wrote HEURTS, and by others HOERTS, are azure or blue rundles.

The Engliſh heralds diſtinguiſh between the colours of rundles, and give them different names agreeable thereto: thoſe of other nations content themſelves to call theſe *torteaux d'azure*; and in other caſes only add the reſpective colour to the term *torteaux*.

But theſe being blue, ſome will have them to ſignify bruiſes or contuſions in the fleſh, which often turn to that colour; others ſuppoſe them whortle berries.

HUSBAND, *Maritus*, a man joined, or contracted with a woman in MARRIAGE.

By the laws of England, the wife is ſuppoſed wholly under the dominion of her *huſband*, nor can act or will any thing of herſelf. See WIFE. See alſo COVERTURE, DIVORCE, DOWER, *Feme covert*, &c.

In Germany, the power of the *huſband* is not ſo extenſive; even the princes of the empire have not a ſovereign and deſpotic power over their wives and children.

HUSBAND-*land*, a term uſed in Scotland for a portion of land containing ſix acres of ſock and ſcythe land; that is, of land that may be tilled with a plough, and mowen with a ſcythe.

HUSBANDRY denotes the ſame with AGRICULTURE.

The reader will find an account of the principal operations, implements, and produce of *huſbandry*, arranged under their proper heads, in the courſe of this work.

The new method of *huſbandry*, called by Tull the *horſe-hoeing huſbandry*, has many evident advantages over the other, or old way, called the *broad-caſt*; but the difference between them is beſt explained by a fair compariſon. In order to do this juſtly, there are four things to be carefully conſidered. 1. The expence of a crop. 2. The goodneſs of the crop. 3. The certainty of it. And, 4. The condition in which the land is left after the crop.

The profit or loſs ariſing from land, is not to be computed only from the value of the crop it produces, but from its value after all expences of ſeed, tillage, &c. are deducted. Thus when an acre of land produces a crop worth four pounds, and the expences of it amount to five pounds, the loſs of the farmer is one pound upon it; whereas, when as much land produces a crop only of the value of thirty ſhillings, and the expences are only ten ſhillings, the owner receives one pound advantage. The common expence of an acre of ſowed wheat, in the uſual way, is four pound ten ſhillings, and the common expence of an acre of wheat, in the horſe-hoeing *huſbandry*, is only ten ſhillings, including all the expences that can attend it. Thus, the charge of this method of *huſbandry* is but a ninth part of that of the common way; and as no ſheep are required, as there are in the other way, the leſs ſtock will do to begin with. The goodneſs of a crop conſiſts in the quality of it as well as in the quantity, and wheat being the moſt uſeful of all grain, a crop of this is more valuable than a crop of any other corn. Add to this, that a crop of hoed wheat has always larger ears, and a fuller body, than a crop when ſown in the common way. More wheat may alſo be obtained this way than any other,

other, because the same land will thus produce crops every year; and even the land which has been exhausted by the common *husbandry*, will produce wheat in plenty this way, without fallowing or dunging, both which would otherwise be necessary; so that, in many places, this *husbandry* can raise ten acres of wheat for one that the old way could produce, because where land is poor, they sow but a tenth part of it in wheat.

The largest produce of an acre of wheat-land, so far as has yet been experienced, seems to be ten quarters, or eighty bushels to an acre. This is less indeed than the produce of an acre in the common way, according to Houghton's computation; but to compare the different profits to the farmer, we proceed thus: the rent and expences of a drilled acre being one pound, and that of a sowed acre in the common way being five pounds, one quarter of corn produced by the drilled, bears an equal proportion in profit to one pound, as five quarters produced in the common way do to five pounds. As suppose it to be of wheat at two shillings and six pence a bushel, there is neither gain nor loss in the one nor the other acre, though the drilled produce only one quarter, and the other five quarters. But if the drilled acre yield two quarters, and the sown acre yield only four quarters at the same price, the drilled acre brings the farmer one pound profit, while the other has one pound loss. Likewise suppose the drilling farmer to have his five pounds laid out in five acres of wheat, and the other to have his five pounds laid out in one dunged acre, then let the price be what it will for the wheat, if the five acres have an equal crop to the one acre, the gain and loss must be equal. But if the price of wheat be at two shillings and six pence, the farmer in the common way, if he has five quarters on his acre, must sell it all to pay his rent and expence; whereas if he who drills the land have five quarters on each acre, the produce of one acre will pay for all five. Or suppose a drilled acre to produce no more than one third of the sown acre, which is rating it very low indeed, the expence of the sown acre being five times as much as that of the drilled one, it is much more profitable to the owner to have the drilled acre; because a third part of five pound is one pound thirteen and four pence, and a fifth of the rent and expence, which is all his charge, being only one pound, such a drilled acre brings the owner thirteen and four-pence profit more than the sown acre, though that brings three times as great a crop.

We shall here subjoin a comparative view of the old and new method of culture, furnished for the editors of Mr. Tull's Horse-hoeing Husbandry, by a gentleman, who for some years practised both in a country, where the soil was light and chalky, like that from which he drew his observations. It is necessary to remark, that in the new *husbandry* every article is stated at its full value, and the crop of each year is four bushels short of the other; though, in several years experience, it has equalled and generally exceeded those of the neighbourhood in the old way.

An estimate of the expence and profit of ten acres of land in twenty years.

I. In the old way.

	l.	*s.*	*d.*	*l.*	*s.*	*d.*
First year, for wheat, costs 33*l.* 5*s.* viz.						
First plowing, at 6*s.* per acre	3	0	0

Seed, four bushels per acre, at 2*s.* per bushel	4	0	0			
Cutting, raking, and carrying, at 3*s.* 2*d.* per acre	1	11	8			
Grass-seeds, at 3*s.* per acre	1	10	0			
				11	6	8
				44	11	8

	l.	*s.*	*d.*
Third and fourth years, lying in grass, cost nothing: so that the expence of ten acres in four years comes to 44*l.* 11*s.* 8*d.* and in twenty years to	222	18	4
First year's produce is half a load of wheat per acre, at 7*l.*	35	0	0
Second year's produce is two quarters of barley per acre, at 1*l.*	20	0	0
Third and fourth year's grass is valued at 1*l.* 10*s.* per acre	15	0	0
So that the produce of ten acres in four years is	70	0	0
And in twenty years it will be	350	0	0
Deduct the expence, and there remains clear profit on ten acres in twenty years by the old way	127	1	8

II. In the new way.

	l.	*s.*	*d.*
First year's extraordinary expence is, for plowing and manuring the land, the same as in old way	22	0	0
Plowing once more, at 4*s.* per acre	2	0	0
Seed, nine gallons per acre, at 4*s.* per bushel	2	5	0
Drilling, at 7*d.* per acre	0	5	10
Hand-hoeing and weeding, at 2*s.* 6*d.* per acre	1	5	0
Horse-hoeing six times, at 10*s.* per acre	5	0	0
Reaping, binding, and carrying, at 6*s.* per acre	3	0	0
The standing annual charge on ten acres is	13	15	10
Therefore the expence on ten acres in twenty years is	275	16	8
Add the extraordinaries of the first year, and the sum is	297	16	8
The yearly produce is at least two quarters of wheat per acre, at 1*l.* 8*s.* per quarter; which, on ten acres in twenty years, amounts to	360	0	0
Therefore, all things paid, there remains clear profit on ten acres in twenty years by the new way	262	3	4

So that the profit of ten acres of land in twenty years, in the new way, exceeds that in the old by 135*l.* 11*s.* 8*d.* and consequently is considerably more than double thereof; an ample encouragement to practise a scheme, whereby so great advantage will arise from so small a quantity of land, in the compass of a twenty-one years lease; one year being allowed, both in the old and new way, for preparing the ground.

It ought withal to be observed, that Mr. Tull's *husbandry* requires no manure at all, though we have here, to prevent objections, allowed the charge thereof for the first year; and moreover, that though the crop of wheat from the drill-plough is here put only at two quarters on an acre, yet Mr. Tull himself, by actual experiment and measure, found the produce of this drilled wheat-crop amounted to almost four quarters on an acre.

It appears also from a comparative calculation of expence and profit between the drill and common *husbandry*, taken from Mr. Baker's report to the Dublin Society of his experiments in agriculture for the year 1765, that there is a clear profit arising upon an Irish acre of land in fifteen years in the drill *husbandry* of 52*l.* 3*s.* 11*d.* and in the common *husbandry* of 27*l.* 19*s.* 2*d.* and therefore a greater profit in the drilled acre in this time of 24*l.* 4*s.* 9*d.* which amounts to 1*l.* 12*s.* 3¾*d.* per annum. From hence he infers, that in every fifteen years the fee-simple of all the tillage-lands of the kingdom is lost to the community by the common course of tillage. In stating the accounts, for which their result is obtained, no notice is taken of fences, water-cutting the land, weeding and reaping, because these articles depend on a variety of circumstances, and will, in general, exceed in the common *husbandry* those incurred by the other.

Besides, the certainty of a crop is greater in this new way than in the old way of sowing; for most of the accidents attending wheat crops, are owing to their being late sown, which is necessary to the farmer in the old way; but in the *horse*-hoeing method the farmer may plough two furrows whereon the next crop is to stand, immediately after the first crop is off. In this manner of *husbandry* the land may be ploughed dry and drilled wet, without any inconvenience; and the seed is never planted under the furrow, but placed just at the depth which is most

moſt proper, that is, at about two inches, in which caſe it is eaſy to preſerve it, and there is no danger of burying it. Thus the ſeed has all the advantage of early ſowing, and none of the diſadvantages that may attend it in the other ways, and the crop is much more certain than by any other means that can be uſed.

The condition in which the land is left after the crop, is no leſs in favour of the horſe-hoeing *huſbandry*, than all the other articles. The number of plants is the great principle of the exhauſting of land. In the common *huſbandry*, the number is vaſtly greater than in the drilling way, and three plants in four often come to nothing, after having exhauſted the ground as much as profitable plants; and the weeds which live to the time of harveſt in the common way, exhauſt the land no leſs than ſo many plants of corn, often much more. The horſe-hoeing method deſtroys all the weeds in the far greater part of the land, and leaves that part unexhauſted and perfectly freſh for another crop. The wheat plants being alſo but a third part of the number at the outſet of thoſe in the ſowing way, the land is ſo much the leſs exhauſted by them; and it is very evident from the whole that it muſt be, as experience proves that it is, left in a much better condition after this than after the common *huſbandry*.

The farmers who are againſt this method object, that it makes the plants too ſtrong, and that they are more liable to the blacks or blights of inſects, for that reaſon; but at this alone that the hoeing can, without the uſe of dung, give too much nourihment, it is very plain that it can give enough; and it is the farmer's fault if he do not proportion his pains ſo as to have the advantage of the nourihment without the diſadvantages. It is alſo objected, that at hoeing can make poor land rich enough to bear good crops of wheat, it may make good land too rich for it. But if this ſhould happen, the ſowing of wheat on it may be let alone awhile, and in the place of it the farmer may have a crop of turneps, carrots, cabbages, and the like, which are excellent food for cattle, and cannot be over nourihſhed: or, if this is not choſen, the land, when thus made too rich, may ſoon be ſufficiently impoveriſhed by ſowing corn upon it in the common old way. Tull's Horſe-hoeing Huſbandry, Preface, and chap xviii. See HOEING.

The method of horſe-hoeing *huſbandry*, ſo ſtrongly recommended by Mr. Tull, is objected to by many, on account of the largeneſs of the intervals which are to be left behind the rows of corn. Theſe are required to be about five feet wide; and it is thought that ſuch wide ſpaces are ſo much loſt earth, and that the crop is to be ſo much the leſs for it. But it is to be obſerved, that the rows of corn ſeparated by theſe intervals, need not be ſingle; they may be double, triple, or quadruple, at the pleaſure of the farmer; and four rows thus ſtanding as one will have the five foot interval but one fourth of its bigneſs as to the whole quantity, and it will be but as fifteen-inch intervals to plants in ſingle rows. Corn that is ſown irregularly in the common way, ſeems indeed to cover the ground better than that in rows; but this is a *mere deception to the eye*, for the ſtalks of corn are never ſo thick as when they come out of one plant, or as when they ſtand in a row, and a horſe-hoed plant of corn will have twenty or thirty ſtalks in a piece of ground of the ſame quantity, where an unhoed plant will have only two or three ſtalks. If theſe ſtalks of the hoed plant were ſeparated and planted over the intervals, the whole land would be better covered than it is in the common way; and the truth is, that though theſe hoed fields ſeem to contain a much leſs crop than the common ſown fields, yet they in reality do contain a much greater. It is only the different placing that makes the ſown crop ſeem the larger, and even this is only while both crops are young. The intervals are not loſt ground, as is uſually ſuppoſed, but when well horſe-hoed they are all employed in the nouriſhment of the crop, the roots of the plants in the adjoining rows ſpreading themſelves through the whole interval, and drawing ſuch nouriſhment from it, that they increaſe accordingly. When the plants ſtand in the ſcattered way, as in common ſowing, they are too cloſe to one another; each robs its neighbours of part of their nouriſhment, and conſequently the earth is ſoon exhauſted, and all the plants half-ſtarved. The cloſe ſtanding of them alſo prevents the benefit of after-tilling, as the hoe cannot be brought in, nor the ground by any means ſtirred between them to give it a new breaking, and conſequently afford them new food.

Experiments have abundantly proved, that in large grounds of wheat where the different methods have been tried, thoſe parts where the intervals were largeſt have produced the greateſt crops, and thoſe where hoeing was uſed without dung, have been much richer than thoſe where dung was uſed without hoeing. If it were poſſible that plants could ſtand as thick, and thrive as well over the whole ſurface of the ground, as they do in the rows ſeparated by theſe large intervals, the crops of corn ſo produced would be vaſtly greater than any that have been heard of; but the truth is, that plants receive their growth not according to the ground they ſtand on, but to the ground they can extend their roots into; and therefore a ſingle row may contain more plants than a large interval can nouriſh, and therefore the ſame number that ſtand in that row, and no more than theſe, would be nouriſhed, if ſcattered over the whole interval; and they would be much worſe nouriſhed in that way, becauſe while the interval is void, the earth may be ſtirred about them, and new roots will be formed in great numbers from every one broken by the inſtruments, and new nouriſhment laid before theſe roots by the breaking the particles of earth, by which the plants will have ſupplies that they cannot have when ſcattered over the whole ſurface, becauſe the ground is then all occupied, and cannot be moved between the plants.

The horſe-hoeing which takes place in theſe large intervals, is to be repeated ſeveral times; once or twice hoeing is of great advantage, but the oftener it is repeated the better the crop will ſucceed. In the beginning, or while the plants are young, it is to be done only in the middle of the interval, that the roots of the tender plants may not be injured by coming too near them; but in the grown plants the hoe may be brought very near their roots without any fear of harm from it; and though the larger roots are many of them broken off by it, they are ſo ſoon ſupplied with new ones, that no ill conſequence was ever known to attend it. Poor land, though it be ever ſo light, ſhould have many hoeings; for the plants receive but little nouriſhment from its natural poſture, and it is therefore neceſſary to make a continual ſupply of the artificial. The young roots multiplied by the breaking of the old ones with the hoe, are ſo many ſeveral mouths for receiving of nouriſhment, than the old ones; and it is therefore no wonder, that the latter theſe are propagated the better the plant thrives. And there is a diſadvantage in the plants of corn ſown in the common way, which is, that their ſtalks being as numerous, or nearly ſo at firſt as afterwards, they very quickly exhauſt the ground, whilſt the plants in rows with intervals between have much fewer ſtalks at firſt, and only increaſe in number as their roots are increaſed by the cutting, and the nouriſhment increaſed alſo by the ſame operation. The earth about the ſown plants in the common way ſoon hardens and ſhuts out the benefit of the atmoſphere, whereas in the other way the hoe keeps it looſe and open, ready to receive all the benefits of rains and dews; and though the crop of corn from the hoed interval way ſhould be twice as large as the other, the land is yet leſs twice as rich for the next crop.

It is impoſſible to bring theſe calculations to mathematical rules; but it is very certain that a ſown crop ſucceeding a large unhunged hoed crop, is much better than a ſown crop that ſucceeds a ſmall hunged ſown crop; and experience ſhews, that poor worn-out heath-ground will produce four ſucceſſive good hoed crops, the latter all better and better, till the whole is become at length good ground by the benefit of the hoeing, in ſpite of the nouriſhment drained out by the potatoes.

The wider the intervals are, the more the earth may be divided; for the row takes up the ſame room with a wide or a narrow interval; and therefore with the wide the unhoed part bears a leſs proportion to the hoed part than in the narrow.

There are many ways of hoeing with the hoe-plough, but there is not room to turn two deep and clean furrows in an interval that is narrower than four feet eight inches; for if it want much of this breadth, one at leaſt of theſe furrows will reach and fall upon the next row, which will be very injurious to the plants, except of grown ſaint-foin or ſome other ſuch plants, which can bear to have the earth pulled over them with a harrow.

All ſoils and all ſituations are not equally proper for this method of planting in rows, with large intervals and hoeing between. The lighteſt ſoils ſeem to be beſt for it, and the rough and wet clays the worſt.

Such grounds as lie on the ſides of hills are alſo leſs proper than others for this work.

This method is not ſo proper in common fields, but that not in reſpect of the ſoil, but of the huſbandry of the owners, who are uſually in the old way, and change the ſpecies of corn, and make it neceſſary to follow every ſecond, third, or fourth year. Tull, ubi ſupra, chap. vi.

Nevertheleſs it has been found by later experiments, that the intervals betwixt the rows of plants, as recommended by Mr. Tull, were too great, perhaps double of what they ſhould be in the moſt profitable method of culture; by which means much leſs crops are obtained than might be produced at nearly the ſame expence. This has rendered the profits of the drill method much leſs than they would

would have been in a more judicious practice, and, consequently, has proved a great disadvantage to it in comparison with the broad-cast. Mr. Tull was led into this, partly from the want of more perfect instruments for hoeing, and of ploughs proper for drilling. Duhlle's Mem. of Agriculture, vol. i. p. 75.

HUSBANDRY, *broad-cast*. See BROAD-*cast*.

HUSBANDRY, *Virgilian*, a term used by authors to express that sort of *husbandry*, the precepts of which are so beautifully delivered in Virgil's Georgics. The *husbandry* in England is Virgilian in general, as is seen by the method of paring and burning the surface, of fattering or cross-plowing, and of the care of destroying weeds upon the same principle, and by much the same means. In those parts of England along the southern coast, where the Romans principally inhabited, not only the practices, but the expressions are in many respects the same with those of the ancient Romans, many of the terms used by the plowmen being of Latin origin, and the same with those used by those people on the like occasions. And on a strict observation, more of Virgil's *husbandry* is at this time practised in England than in Italy itself. This change in the Italian *husbandry* is, however, much more to the credit of that people, than the retaining the Virgilian scheme is to our's.

Tull, who has established a new method of *husbandry*, observes, that it is upon the whole so contradictory to this old plan, that it may be called the *anti-Virgilian husbandry*; and adds, that no practice can be worse than the Virgilian.

HUSBRECE, in our *Old Writers*, an offence now called BURGLARY.

The word is Saxon, from *hus*, a *house*, and *brice*, a *breaking*. Blount, in voc.

HUSCANS, in our *Old Writers*, a sort of boot or buskin made of coarse cloth, and worn over the stockings. We find them mentioned in the stat. 4 Edw. IV. cap. 7.

HUSGABLE, *Husgablum*, in our *Old Writers*, denotes house-rent, or some tax or tribute laid upon houses.

HUSK, among *Botanists*, the part which the flower grows out of.

Of these there are several kinds; as *halbeart*, or *round husk*, *bottle husk*, *middle husk*, *spear husk*, *lose husk*, &c. See CALYX.

The *husks* or cups of the flowers of plants are not so much regarded with a view to their medicinal virtues as they deserve. Peiver, in the Philosophical Transactions, speaking of the virtues of the verticillate class of plants, among which are included the sage, rosemary, and the like, observes that it is an erroneous, though general opinion, that the flowers of these plants contain their principal virtues, for that the *husks* are the part in which this is lodged. For instance, in the rosemary, the fine scent of the HUNGARY-*water* is not in the flowers, but *husks*: and the flowers alone, when clean picked from them, yield very little odour. The cup, in this and other plants of the same class, is the only part in which their viscous and sulphurous qualities are lodged, and that something of this kind is deposited particularly there, may be perceived by the touch and smell; for they appear moist, and feel clammy; and this clammy matter, when received upon the fingers, is of a very strong and agreeable smell, much more so than the rest of the plant.

HUSK denotes a disease of young bullocks. See COUGH.

HUSO *Germanorum*, in *Ichthyology*, the name of a large fish of the STURGEON or ACIPENSER kind, without tubercles, caught in the Danube, Boristhenes, and other large rivers, and passing at times into the sea. It has a very long snout, and under it either four or eight beards; it has one back-fin, which is placed near the tail, and two pair under the belly; its general shape somewhat resembles that of the pike, and its back is black, and its belly yellow; it has thirteen dorsal and forty-three caudal scales, and has cartilages instead of bones. It is caught in October and November, and in some places till January, and great numbers of them are usually brought to market together in those months in the countries where they are caught. They always swim in shoals. It grows to twenty-four feet long, and weighs one, two, three, or even four hundred pounds. The drug called ISINGLASS, and the food called CAVEAR, are prepared from this fish. See *Trans.* II. *Fish*, N 14. Ray's Ichthyograph. p. 243.

HUSSARS, HUSSARDS, or HUSSARTS, an order or species of soldiery in Poland and Hungary, commonly opposed to the Ottoman cavalry.

The *hussars* are hereditary, whose uniform is a large furred cap, adorned with a cock's feather; those of the officers with an eagle's or heron's: a very short waistcoat, with breeches and stockings in one piece; short light boots; and a doublet, having five rows of buttons, which hangs loosely on the left shoulder. Their arms are a long crooked sabre, light carbines, and pistols. Before they begin an attack, they lay themselves flat on the necks of their horses; but being come within pistol shot of the enemy, they raise themselves with such quickness, and fall on with such alertness, that it is very difficult for the troops they oppose to preserve their order. In a retreat no other cavalry can pretend to follow them; as they leap over ditches, and swim through rivers with a surprising facility. Most of the princes on the continent have troops under this name.

HUSSITES, in *Ecclesiastical History*, a party of reformers, the followers of John Huss.

John Huss, from whom the *Hussites* take their name, was born in a little village in Bohemia, called Huss, and lived at Prague in the highest reputation, both on account of the sanctity of his manners, and the purity of his doctrine. He was distinguished by his uncommon erudition and eloquence, and performed, at the same time, the functions of professor of divinity in the university, and of ordinary pastor in the church of that city. He imbibed the sentiments of Wickliffe, and the Waldenses; and in the year 1407 began openly to oppose and preach against divers errors in doctrine, as well as corruptions in point of discipline, then reigning in the church. Huss likewise endeavoured to the utmost of his power to withdraw the university of Prague from the jurisdiction of Gregory XII. whom the kingdom of Bohemia had hitherto acknowledged as the true and lawful head of the church. This occasioned a violent quarrel between the incensed archbishop of Prague, and the zealous reformer, which the latter inflamed and augmented, from day to day, by his partial exclamations against the court of Rome, and the corruptions that prevailed among the ecclesiastical orders.

There were other circumstances that contributed to inflame the resentment of the clergy against him. He adopted the philosophical opinions of the REALISTS, and vehemently opposed and even persecuted the NOMINALISTS, whose number and influence were considerable in the university of Prague. He also multiplied the number of his enemies in the year 1408, by procuring, though his great credit, a sentence in favour of the Bohemians, who disputed with the Germans concerning the number of suffrages which their respective nations were entitled to in all matters that were carried by election in this university. In consequence of a decree, obtained in favour of the former, which restored them to their constitutional right of three suffrages, usurped by the latter, the Germans withdrew from Prague, and in the year 1409, founded a new academy at Leipsick. This event no sooner happened, than Huss began to inveigh with greater freedom than he had before ventured against the errors and corruptions of the clergy, and to recommend, in a public manner, the writings and opinions of Wickliffe, as far as they related to the papal hierarchy, the depravity of the court of Rome, and the corruption of the clergy. Hence an accusation was brought against him, in the year 1410, before the tribunal of John XXIII. by whom he was solemnly expelled from the communion of the church. Notwithstanding this sentence of excommunication, he proceeded to expose the Romish church with a fortitude and zeal, that were almost universally applauded.

This eminent man, whose piety was equally sincere and fervent, though his zeal was perhaps too violent, and his prudence not always circumspect, was summoned to appear before the council of Constance. Secured, as he apprehended, from the rage of his enemies by the safe-conduct granted him by the emperor Sigismund, for his journey to Constance, his residence in that place and his return to his own country, John Huss obeyed the order of the council, and appeared before it, to demonstrate his innocence, and to prove that the charge of his having deserted the church of Rome was entirely groundless. However, his enemies so far prevailed, that, by the most scandalous breach of public faith, he was cast into prison, declared a heretic, because he refused to plead guilty against the dictates of his conscience, in obedience to the council, and burnt alive in 1415; a punishment which he endured with unparalleled magnanimity and resignation.

The same unhappy fate was borne by Jerome of Prague, his intimate companion, who attended the council, in order to support his persecuted friend. Jerome, indeed, was terrified into temporary submission; but he afterwards resumed his fortitude, and maintained the opinions, which he had for a while deserted through fear, in the flames, in which he expired in 1416.

The disciples of Huss adhered to their master's doctrine after his death, with a zeal which broke out into an open war, that was carried on with the most savage and unparalleled barbarity. John Ziska, a Bohemian knight, in 1420, put himself at the head of the *Hussites*, who were now become a very considerable party, and threw off

off the despotic yoke of Sigismund, who had treated the brethren in the most barbarous manner. Ziska was succeeded by Procopius, in the year 1424. The acts of barbarity that were committed on both sides were shocking and horrible beyond expression: for, notwithstanding the irreconcilable opposition between the religious sentiments of the contending parties, they both agreed in this one horrible principle, that it was innocent and lawful to persecute and extirpate with fire and sword the enemies of the true religion; and such they reciprocally appeared to each other. These commotions in a great measure subsided by the interference of the council of Basil, in the year 1433.

The *Hussites*, who were divided into two parties, viz. the CALIXTINES and TABORITES, spread over all Bohemia and Hungary, and even Silesia and Poland; and there are some remains of them still subsisting in all those parts. Mosheim's Eccl. Hist. vol. iii. p. 227, &c. 2vo. &c. Engl. ed. 8vo. 1768.

HUSTINGS. See COURT *of hustings*.

HUT, or HUTT, from the Saxon *hutte*, a small cottage or hovel.

The word is also used for the soldiers lodges in the field otherwise called BARRACKS, or CASERNS.

HUTCH, among *Farmers*, denotes a vessel or particular place in which to lay corn: also a kind of hollow trap for the taking of weasels, or other vermin, alive: and it also signifies a sort of case, formed of boards and flips of wood, opening in front, and divided within, for keeping and breeding rabbits.

HUTCHINSONIANS, in *Ecclesiastical History*, a kind of cabbalistic sect, that sprung up in this country towards the beginning of this century, and that derived its name from John Hutchinson, who was born in Yorkshire, A. D. 1674. Having been educated in his father's house with a view to the office of steward to some gentleman or nobleman, he was advanced at an early period of life to this station in the service of the duke of Somerset; and his business calling him to London about the year 1700, he became acquainted with Dr. Woodward, who employed him in making that large and noble collection of fossils, &c. which the doctor bequeathed to the university of Cambridge. Mr. Hutchinson, being desirous of prosecuting his literary studies, begged leave to quit the service of the duke, who appointed him his ridingpurveyor, with a fixed salary of 200*l.* per annum; and this place he enjoyed till his death in 1737. In 1724 he published the first part of his Moses's Principia, in which he ridiculed Dr. Woodward's Natural History of the Earth, and his account of the settlement of the several strata, shells, and nodules, by the law of gravity; and from this time to his death he continued publishing a volume every year, or every other year; which, with the manuscripts left behind, were published in 1748, in twelve volumes octavo; an abstract of his works was also published in 1732. In 1732 Mr. Hutchinson completed a machine of the watch kind for the discovery of the longitude at sea, which is said to have been so contrived, that the spring, wheels, and pivots, &c. were not in any considerable degree influenced by heat, cold, moisture, and drought, and to be capable of that degree of exactness which is requisite for the purpose. In 1727 he published the second part of Moses's Principia, containing the principles, or he apprehends, of the Scripture philosophy; which are, a plenum, and the air. The air he supposes to exist in three conditions, viz. fire, light, and spirit; the two latter are the finer and grosser parts of the air in motion: from the earth to the sun, the air is finer and finer, till it becomes pure light near the confines of the sun, and fire in the orb of the sun, or solar focus. From the earth, towards the circumference of this system, in which he includes the fixed stars, the air becomes grosser and grosser, till it becomes turpid and stagnant, in which condition it is at the utmost verge of this system; from whence he says, the expression of "outer darkness, and blackness of darkness," used in the New Testament, seems to be taken. The sun, which he places in the centre, is the active vivifying agent, which, by melting the spirit or grosser parts of the air into atoms or finer parts, or æther, sets the machine forward, and keeps it a-going: for the light is pressed out by the influx of spirit, and the spirit is pressed in by the influx of light; and thus the whole matter of the heavens or air is perpetually changing conditions, and circulating. In the introduction to his work, Mr. Hutchinson suggested, that the idea of the Trinity was to be taken from the three grand agents in the system of nature, fire, light, and spirit; which are three conditions of one and the same substance, and wonderfully answer in a typical or symbolical manner to the three persons of one and the same essence. He also discovers this doctrine in the term *cherubim*, which he derives from כ *kaf*, denoting *similitude*, or *resemblance*, and רבים, plural of רב, a *great* or *mighty one*; and so the cherubim, i. e. the similitude of the great ones, were represented by a bull, the chief of the tame animals, the lion the chief of the wild, and the eagle of the winged; and these again were figures of the celestial cherubim, or fire, light, and spirit. The bodies of these three animals were all joined in one, in order to signify the unity of the essence, and the distinction of the persons, and man taken into the essence by his personal union with the second person, whose constant emblem was the lion; and Mr. Hutchinson contends, that the very name of the figure was an hieroglyphical representation of the Trinity. The same doctrine is also taught by the word שמים, translated *heavens*; but which the *Hutchinsonians* suppose to signify *names*, being as they say, the plural of שם, a *name*; and the heavens according to them, are called names, because the material heaven, having in its one substance three continuums of fire, light, and spirit, is the proper name or representation of the deity in its unity of essence, and trinity of persons; or of the אלהים *Elohim*, or *Shem*, which they derive from אלה, *alah*, an *oath*, or *conditional imprecation*, and, therefore, must signify persons that have bound themselves by an indispensable obligation; hereby intimating that the three persons of the Godhead have absolutely covenanted together, to redeem man. On this account the singular Jehovah, q. d. the essence existing, is so commonly found in conjunction with the plural *Elohim*, i. e. the *confederates* or *adjurators*. They derive יהוה, *Jehovah*, also from the same root, and translate it the *accursed one*, referring to Christ, who really made a curse for us. The word ברית, which we translate *covenant*, they derive from ברר, to *purify*, and render *purifier*; and thus ברית ברית, which is commonly rendered to *make a covenant*, they translate to *eat of the purifier*. In this way Mr. Hutchinson and his followers have founded their whole system of theology and philosophy on a forced and fanciful etymology of Hebrew words; indulging their genius in all the wildness of imagination and unbounded whim, making words signify what they please, turning the plainest history into sublime prophecy, and construing testences to be peculiar assertions, were with meanings which they were never designed to bear, and which they are incapable of bearing. The Scriptures, according to this author, written in Hebrew without points, which is the language framed in paradise, and each root of which represents some obvious idea of action or condition, raised by the sensible object which it expresses, and further designed to signify spiritual or mental things; the Hebrew Scriptures, he says, rightly translated and understood comprise a perfect system of natural philosophy, theology and religion. Mr. Hutchinson especially says, that as God was primarily represented by the heavens, to emblems, or draughts of them, or descriptions in Hebrew words, were no more than copies of the archetypes; and thus the knowledge of the *Name* is derived from the light of nature, not as that phrase is vulgarly understood, by any innate or inbred power in man, but by the immediate instruction of the Most High, the alone interpreter as well as the lord of nature. The Greek, he says, that language of erring heathens, because of necessity made to the apostles, to spread the history of faith, which it behoved all men to be apprized of; but Christ and his disciples knew no will in superstition and ignorance to give just ideas of the divine oeconomy, to make use of it for that purpose. The original scriptures in Hebrew were distinct permanent evidence; to these references are always made, and there complete satisfaction is to be found. He also observes, that as the material machine is peculiarly suited to the service of the body; so its secondary, but most important use, is to treasure up ideas for the immortal soul, by affording types and evidences of the otherwise unintelligible attributes of the Deity. Hence it must follow, that the language of Scripture, which is admirably adapted to convey true and literal descriptions, will also in many places require an emblematical [illegible] interpretation, corresponding to the circumstance and [illegible] creature who has a *soul to preserve*. The *Hutchinsonians* not only erect their fanciful system of logical and philosophical opinions on the [illegible] roots and symbols, to the ruin of [illegible] morality, but they loudly declaim against [illegible] and reason; and they expressly call abstract reasoning the very province of the devil.

The reader may find a distinct and complete [illegible] account of the *Hutchinsonian* system in a book entitled, "Tracts concerning Religion," &c. printed at Edinburgh, 1749, 12mo. and in a Letter to a Bishop, annexed to [illegible] printed in 1753.

HUXING *of fish*, among *Fishermen*, a particular method of catching that fish.

For this purpose, they take thirty or forty as large bladders as can be got, blow them up, and tie them close and

and ſtrong; and at the mouth of each is a ſtiff, longer or ſhorter, according to the depth of the water. At the end of the line is faſtened an armed hook, artfully baited; and thus they are put into water with the advantage of the wind, that they may gently move up and down the pond. When a matter pike has ſtruck himſelf, it affords a great entertainment to ſee him bounce about in the water with a bladder faſtened to him; at laſt, when they perceive him almoſt ſpent, they take him up.

HYACINTH, *Hyacinthus*, in botany, a genus of the *hexandria monogynia* claſs. Its characters are theſe: the flower has no empalement; it has one bell-ſhaped petal, whoſe rim is cut into ſix parts, and three nectariums to the point of the germen, with ſix ſhort awl-ſhaped ſtamina; in the centre is ſituated a roundiſh three-cornered germen, having three rudiments, which afterward becomes a roundiſh three-cornered capſule, having three cells, which contain roundiſh bulbs. There are ſeveral ſpecies, including many varieties.

All the kinds of this beautiful flower may be propagated either by ſowing their ſeeds, or by parting their bulbous roots. The latter has been the method moſt practiſed among us, though the former is certainly the way to procure the fineſt varieties of the flowers, and has been always practiſed in Holland. The diſcouragement in this is, in being near the plants two years from the ſowing, when it is uſually time for the plants to blow; but then it is but they are moved every year after the firſt two or five years, there is always a conſiderable ſucceſſion of flowers from ſeed.

The ſeed ſhould be carefully ſaved either from ſingle flowers, or the moſt ſingle flowers, and ſown on a freſh, light, and ſomewhat ſandy ſoil, in ſhallow pots or boxes, covering them with half an inch of the ſame earth. This ſhould be done about the middle of Auguſt, and the pots ſhould be placed where they may have the morning ſun till the latter end of September; they ſhould then be removed to a ſomewhat warmer ſituation, and towards the end of October be put under a common hot-bed frame. In February the young plants will appear above ground, and muſt be carefully ſereened from froſts; but they muſt not be clear covered, except at nights. At the end of March, in good weather, they muſt be taken out of the frames, and ſet in a warm place; and when the weather is dry, they muſt be greatly watered at times, and always kept carefully clear from weeds.

Towards the latter end of April, or beginning of May, they muſt be removed into a cooler ſituation, as the heat of the ſun would then be too much for them. After their blades are decayed, they muſt have an entire watering; but towards the latter end of Auguſt, a ſmall quantity of light rich earth ſhould be ſifted over the pots; after this they muſt be preſerved, and managed as in the former ſeaſon, and in the Auguſt following, a bed of a light, rich, ſandy ſoil, ſhould be prepared. Then the earth is to be taken out of the pots and boxes, and the roots, which will at this time be about the bigneſs of a ſmall quill, muſt be ſeparated and carefully placed upon the bed, at two or three inches diſtance; they are to be ſet with the bottom part downwards, and covered two inches thick, with the ſame fine earth ſifted over them. Their beds muſt be arched over, and in ſnowy weather covered with mats. In ſpring, if the weather prove dry, they muſt be watered ſtrongly. In ſummer they muſt be carefully kept clear of weeds, and in autumn have an inch more of light earth thrown over them. In the third year, the roots muſt be carefully taken up, when their leaves decay, and kept out of the ground till Auguſt, then planted into new beds as before, at the diſtance of ſix inches aſunder, where the roots may remain till they flower, and treated in the manner already directed, with this difference, that, inſtead of covering them with mats in the winter, the ſurface of the ground ſhould be covered with tanners bark.

When they are in flower, the fineſt ſorts ſhould be marked with a ſtick, that they may be taken up and planted ſeparate.

When the green leaves of theſe plants begin to decay, their roots muſt be taken up, and the earth of the bed being raiſed into a ridge in form of the mortiers, they ſhould be laid into the earth again in a horizontal poſition, leaving the green leaves hanging clear from the roots, to prevent their moiſture from running into the roots, which often cauſes them to rot.

When the leaves are quite dried, the roots are to be taken up and cleared of filth, and laid up in boxes, where they may be preſerved dry till September, which is the beſt time for planting them again. The proper ſoil for planting theſe in, is that called our light freſh earth, from a common, for a floor which is of a ſandy nature; this ſhould not be got beyond nine inches deep; to the laſt a fourth part of ſea-ſand, and a fourth part of rotten cow-dung.

This ſhould be mixed a long while before it is uſed, and often turned; and ſhould be ſpread two feet deep on the beds, with a little rotten cow-dung, or old tanners bark, at the bottom. Theſe beds ſhould be raiſed from three to four inches above the ſurface of the earth, in a dry ſoil, but from ten to twelve inches, if the ſoil be wet, and be a little riſing or rounded in the middle. In theſe beds ſpread over the beds ſome rotten cow-dung, about four inches thick, and ſtrike the bulbs on each ſide with rotten bark, duſt, or ſand. When the flowers are about to blow, the ſtalks ſhould be ſupported by a hoop of wire to a ſmall ſtick, to prevent their bending down, and they muſt be covered from the great heat of the ſun in the middle of the day, by which means they will continue in flower a month or longer.

When the flowers are quite decayed, and the tops of the leaves begin to change their colour, for the roots be carefully raiſed out of the ground with a *narrow ſpade*, or ſome other convenient inſtrument, to prevent their receiving any more nouriſhment from the ground; and about a fortnight after this operation, take the roots entirely out of the ground, pare the earth of the bulbs into a high ridge, and lay the roots into it in a horizontal poſition, with their leaves hanging out, by which means the moiſture of the ſtalks and leaves will evaporate, and thus be prevented from returning to the roots, and cauſing them to decay. In this poſition they ſhould remain, till the green leaves are entirely decayed, which may be in about three weeks time; or by which method the bulbs will come freſh, and be more curious flowers, and of a bright purple colour. After this, take them out of the ground, wipe them clean with a ſoft woollen cloth, taking off all the decayed parts of the leaves and fibres, and put them into open boxes, where they may lie freſh; and thus they may be preſerved out of the ground all September, the ſeaſon for planting them again. *Miller.*

HYACINTH, *Perſian lilac*, *ſcented ſtock*, *Corinna*. See *Hyacinth* LILY.

HYACINTH, *gem* or *muſk*. See *Jacinth*, in *Nature*.

HYACINTH, *grape* or *muſk*, *Muſcari*, in botany. In characters are theſe: the flower has no empalement; it hath one oval pitcher-ſhaped petal, which is reflexed at the brim; it hath three nectariums on the top of the germen, and ſix awl-ſhaped ſtamina, which are ſhorter than the petal, whoſe ſummits join together; in the centre is ſituated a roundiſh three-cornered germen, ſupporting a ſingle ſtyle, crowned by an obtuſe ſtigma; the germen afterwards turns to a roundiſh three-cornered capſule, having three cells filled with roundiſh ſeeds. Miller enumerates ſix ſpecies. Linnæus makes three ſpecies of the HYACINTH.

We have ſeveral ſpecies of this plant cultivated in gardens; three or four for the beauty of their flowers, and one with a purpliſh green flower for the remarkable ſweetneſs of its ſcent. In June, when the leaves of theſe plants are decayed, the roots ſhould be taken up and ſpread upon mats in a dry place for a fortnight, till the bulbs are dried; then they may be packed up, each ſort by itſelf, till October, when they are to be planted in borders for flowering the following ſpring. They ſhould never be ſuffered to remain in the ground more than two years unremoved; for they multiply ſo faſt that the number of the offſets greatly weakens the flowering roots, and the flowers are conſequently ſmall. They are eaſily propagated by theſe offſets, which are ſo ready as to grow even if buried a foot under ground; and the common kind propagates itſelf ſo faſt this way, that when it has once got poſſeſſion of a bed, it is with great difficulty extirpated.

HYACINTH, *ſea*. See SQUILL.

HYACINTH, *ſtarry*. See *STAR of Bethlehem*.

HYACINTH, *tuberoſe*. See POLIANTHUS.

HYACINTH, or JACINTH, in *Natural Hiſtory*, a precious ſtone; originally thus called, from its reſemblance of the purple flower named *hyacinth*.

This is a very different gem from that known by the ancients under the name of the *ſapphire*, which was a variety of the amethyſt, with a larger admixture of a deep blue, a ſtone ſeldom ſeen among us. The ancients knew this gem, called the *hyacinth* by us, under the name of *lapis hyacinthus*.

It is a leſs gaudy looking gem than any other of the red ones; but is not without its beauty, which in the fineſt ſpecimens is great, though not glaring; and is as often found poſſeſſed of faulty as almoſt any other gem. It is of various ſizes, but is ſeldom found ſmaller than a hempſeed, or larger than a nutmeg. We have had accounts, indeed, of ſome of a much larger ſize; but they ſeem not much to be depended upon. It is not leſs irregular in theſe than ſize, being found ſometimes in the figure of a regularly hexangular column, terminated by an hexangular pyramid, and in all reſpects, except colour and tranſlucency, reſembling the cryſtal; and at other times it is found in form of a ſmall roundiſh or oblong pebble, generally flatted on one ſide. It makes much the beſt external appearance in its cryſtalliform ſtate; but the

pebble-shaped masses are much the hardest, and of the finest lustre. It is less hard than the ruby or sapphire, but much more so than crystal.

It is the ninth in degree of hardness from diamonds, and fusible by fire; changing its red colour into a dark black, but preserving even in this form a great degree of hardness. The colour and fusibility of this stone appear to proceed from iron, a portion of which is separable from it by the magnet.

It is found in various degrees of deepness or paleness; but its colour is always a dull or deadish red, with a considerable admixture of yellow, sometimes indeed so much, that the last seems the predominant colour. It is sometimes so deep as to seem almost black, till held up against a strong light, and at others is almost colourless, and probably, not unfrequently is wholly so, though in that case wanting its true character, which is taken from its colour, it is not to be distinguished from pebble crystal on the one hand, nor from the white sapphire on the other, without the assistance of the wheel to ascertain its hardness. Its most usual state, however, is its having that colour mixed of red and yellow, which we usually call flame-colour.

These are the characters by which the *hyacinthus* of the ancients, or *hyacinth* of our times, is to be distinguished from all other gems. And our jewellers and lapidaries, according to its different degrees of colour, distinguish it into three kinds, which they call by its own name, with different epithets; and a fourth, which usually, but improperly, is accounted by authors a ruby.

The first kind is the *la belle hyacintha*: this is the name given to the *hyacinth* in its most perfect and beautiful state, when it is of a pure and bright flame-colour formerly formed of a mixture of cinnabarine red, and a moderate proportion of a fine amber yellow. The second is the *fayrun hyacinth*: this is the name which they give to this gem, when it has more of the red, and that of a deeper and sullier colour, and is tinged with an admixture of a dead and brownish yellow. The third is the *amber hyacinth*: this is the name given to those *hyacinths*, which are tinged with a fainter red, in a small proportion, and a dead whitish yellow. The fourth is the *rubacelle*, a name given to the *hyacinth* when of a very deep and shining red, blended with a very deep but dusky yellow. The strong colour of the red in this stone has generally made it have a place among the rubies, in the accounts of authors; but a comparison of it with the two gems will evidently shew that it belongs not to the ruby, but to the *hyacinth* kind.

The first of these are the *finer hyacinths*, and are of considerable value. They are brought to us both from the East and West Indies. The *rubacelle* is only found in the East Indies, but is of very little value; and the other two varieties are common both to the East and West Indies, and to Silesia and Bohemia, and several other parts of Europe. These are, indeed, sometimes brought over to us from the East Indies, among the finer kind; as is also the *la belle hyacinthe* sometimes found in Bohemia, though poor in comparison of the oriental.

It is no wonder, indeed, that they should be all found equally in both places, being, in reality, only varieties of the same gem; but the oriental are, in general, much the finer and better coloured.

The stone grates or cuts fine, and would be more used for seals, &c. but that the graving frequently costs more than the stone.

The ancients used it for amulets and talismans; and bore it about their necks, or set in rings, &c. supposing it to have the virtue of securing them from the plague, &c.

The *hyacinth* used in medicine, and whereof the confection of *hyacinth* is made, is a different stone from all these, of which there are three several sorts: the first about the bigness and figure of a grain of salt, and pretty soft; the second riddy, and shaped like the point of a diamond, found in divers parts of Italy, Silesia, Bohemia, &c. The third is white, intermixed with yellow, and some other colours; being found in the same places as the red.

In strictness, only the first kind should be used in the CONFECTION *of hyacinth*; but the druggists and apothecaries frequently substitute the other. However, the medical virtues of this and other costly concretes, are very doubtful; the preparations from them are very liable to be adulterated, and similar effects may be produced with much greater certainty by other cheaper substances.

HYACINTHIA, in *Antiquity*, feasts held at Sparta, in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacinth was the son of Amyclas, king of Sparta, and was beloved both by Apollo and Zephyrus. The youth shewing most inclination to the former, his rival grew jealous; and to be revenged, one day, as Apollo was playing at the discus, i. e. quoits, with Hyacinth, Zephyrus turned the direction of a quoit which Apollo had pitched, full upon the head of the unhappy Hyacinth, who fell down dead. Apollo then transformed him into a flower of the same name; and, as a farther token of respect, they say, consumed their feast. The *Hyacinthia* lasted three days; the first and third whereof were employed in bewailing the death of Hyacinth, and the second in feasting and rejoicing.

The persons who assisted at the ceremony were crowned with ivy; because Sys Voffius, De Idolol. lib. ii. cap. 14. that Bacchus and Apollo were the same person.

HYADES, Ταδες, from ὑω, *to rain*, in *Astronomy*, are seven stars in the Bull's head, famous among the poets for the bringing of rain.

The principle of them is in the Bull's left eye, by the Arabs called Aldebaran. Their longitudes, latitudes, &c. see among those of the other stars in the constellation TAURUS.

The poets feign them to have been the daughters of Atlas and Pleione. Their brother Hyas being torn in pieces by a lioness, they wept his death with such vehemence, that the gods, in compassion to them, translated them into heaven, and placed them in the Bull's forehead; where as they say, they continue to weep: this constellation being supposed to portage rain.

Others represent the *Hyades* as Bacchus's nurses; and the same with the Dodonides, who fearing the resentments of Juno, and flying from the cruelty of king Lycurgus, were translated by Jupiter into heaven.

HYÆNA, or HIÆNA, in *Natural History*, a species of the CANIS, with a straight annulated tail, and the hairs of the neck long and erect; naked ears, and four toes on each foot. It has six cutting teeth, and two canine on each jaw; and between the tail, which is short, and the anus, a transverse orifice. The animal which is known to us by this name is a quadruped almost as large as a wolf, excepting that its legs are not in long; the hair of it is rough, and its skin spotted with divers colours. *Hyenas* were formerly produced at Rome in the public games, and they have been represented on some medals, on account of their rarity. Spanheim, who had copies of it engraved from medals, describes it with the head of a mastiff, with short triangular ears, a lion's tail and feet, and hair spotted all over like a tyger's. It inhabits Asiatic Turky, Syria, Persia, and Barbary.

Pliny's account of this animal is very fabulous. He says, that it changes its sex every year; and that from its eyes are taken precious stones, called *hyenia*. Aristotle and Ælian say, that it makes dogs dumb with its shadow; and that it imitates the speech of mankind, in order to deceive them, and thus draw them out of their houses, and devour them. The superstitious Arabs carefully bury the head, when they kill a *hyæna*, lest it should be applied to magical purposes, as the neck was of old, by the Thessalian sorceresses. Lucan, lib. vi. 672.

Bellbequius, in his Travels to Amasia, relates several particulars of this animal. He says it is almost of the shape of a wolf, but not so tall; that its hair is like that of a wolf, except its being more bristly, and marked at certain distances with great black spots; it has no neck, but its head is fastened to the vertebræ of the back, so that it is forced to turn itself quite round, whenever it would look behind. It is very cruel and voracious; it drags dead bodies out of graves, and carries them to its den. It also preys on the herds and flocks. It is said to imitate the voice of a man, and that by this means it often deceives travellers. It is a solitary unsociable animal and inhabits the chasms of rocks. These animals have a most malevolent aspect; and they are in their nature cruel, fierce, and untameable. *See Tab.* III. *Quadrupeds*, N° 22.

HYÆNUS *lapis*, in *Natural History*, the name of a stone said to be found in the eyes of the *hyæna*. Pliny tells us, that these creatures were anciently hunted and destroyed for the sake of these stones, and that it was supposed they communicated the gift of prophecy, being put under the tongue.

HYALE, in *Mythology*, one of the nymphs of [illegible]

HYALINÆ, in *Natural History*, derived from [illegible] the name of a genus of fossils, of the class of [illegible] the characters of which are, that they are [illegible] separate plates, of considerable thickness, [illegible] fillile into any thinner. *See Tab.* [illegible]

There is but one species known of this [illegible] found lodged in the clays in the deep [illegible] river Arabe in Champagne, near the town of [illegible] some other places along that river; but [illegible] known, in no other part of the world.

HYALOIDES, in the *Natural History* of [illegible] name of a transparent stone fit to engrave seals on, [illegible] was the great use they made of the gems, and very bright and readily reflecting the images of things. We have this stone to this day in many parts of America, particularly about the river of the Amazons, from whence

many

many fair ſtones of it have at times been brought, and have been by ſome miſtaken for diamonds; they are a ſort of pebble cryſtal, approaching to what the jewellers call the white ſapphire. Hill's Theophraſt. p. 80.

HYALOIDES, from ὑαλος, *glaſs*, in *Anatomy*, is ſometimes applied to the VITREOUS humour of the eye, contained betwixt the tunica retina, and the uvea.

HYANCHE, a word uſed by the old medicinal writers to ſignify a quinſy, attended with a ſwelling on each ſide of the throat.

HYARITH, a word uſed by ſome of the affected chemical writers, for ſilver.

HYBERNAL *accident.* See OCCIDENT.

HYBERNAL *point.* See ORIENT.

HYBERNICUS *lapis.* See *Iriſh* SLATE.

HYBLÆANUM *bitumen.* See BITUMEN.

HYBOMA, a word uſed by the old medicinal writers for a gibboſity of the ſpine.

HYBRISTICA, of ὕβρις, *injury*, in *Antiquity*, a ſolemn feaſt held among the Greeks, with ſacrifices, and other ceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god, or a goddeſs, or both.

Or, according to the account given by others, the *Hybriſtica* was a feaſt celebrated at Argos, wherein the women, being dreſſed like men, inſulted their huſbands, and treated them with all marks of ſuperiority, in memory of the Argian dames having anciently defended their country with ſingular courage againſt Cleomenes and Demaratus.

Plutarch ſpeaks of this feaſt in his treatiſe of the great actions of women. The name, he obſerves, ſignifies *infamy*; which is well accommodated to the occaſion, wherein the women ſtrutted about in men's cloaths, while the men were obliged to dangle in petticoats.

HYDAGE. See HIDAGE.

HYDARTHROS, of ὕδωρ, *water*, and ἄρθρον, *joint*, a word uſed by the ancient writers in medicine to expreſs a clear water running from the joints when wounded or ulcerated. It is a very common ſymptom in horſes, and our farriers call it *joint-water*.

HYDATIDES, in *Medicine*, are little tranſparent bags or bladders full of water, frequently found in divers parts of the body.

The word is formed of the Greek ὕδωρ, *water*, which in the genitive caſe gives ὕδατος, whence ὑδατίς, *hydatis*.

Hydatides are moſt common in dropſical perſons, and are ſuppoſed to ariſe from a diſtention and rupture of the lymphæducts; being found chiefly in the parts abounding in thoſe veſſels, as the liver, lungs, &c. They are alſo ſometimes found in ſcirrical caſes. See DROPSY, JAUNDICE, &c.

We have inſtances of *hydatides* voided both by ſtool, by urine, and by vomiting. They are of all ſizes, from a pin's head to that of a pullet's egg. Theſe tumors are ſometimes voided by the vagina. Of this Mr. Watſon has given a remarkable inſtance in Phil. Tranſ. N° 461, p. 770.

HYDATIDES, Θεσσαλικαὶ, of ὕδωρ, for ὕδωρ, *water*, in *Natural Hiſtory*, a name given by ſome writers to a ſpecies of ASTROITES, the lineations of which reſemble waves. It is by others uſed as a name of the ENHYDROS.

HYDATINON, in the *Medical Writings of the Ancients*, the name of a collyrium made principally of rain-water.

HYDATIS, Ὑδατὶς, called alſo *Aquula*, in *Medicine*, a diſeaſe in the eyes; being a fatty ſubſtance, growing under the ſkin of the upper eye-lid; by which the whole eye-lid, in children, is ſometimes rendered œdematous.

In order to the cure, an inciſion is made through the ſkin of the eye-lid, and the cyſt is to be diſſected out, if it cannot be drawn away by gently pulling and moving it about. Mr. St. Yves takes notice of a complaint on the edge of the eye-lids, or in the tunica conjunctiva, reſembling the bladders that appear on the ſkin after a burn, which he calls *hydatis*. The method of cure which he propoſes is to open the tumor with the point of a lancet; but if the whole circumference of the globe is covered with it, the conjunctiva will be inflamed, and bleeding, purging, &c. will be neceſſary.

HYDATISM, a word uſed, by ſome writers in *Surgery*, to expreſs the noiſe or ſound made by the ſhaſtuating humours contained in abſceſſes.

HYDATOCHOLOS, of ὕδωρ, *water*, and χολὴ, *bile*, an epithet uſed by the old writers on medicine, for ſtools more than ordinary liquid or bilious.

HYDATOIDES, Ὑδατοειδὴς, formed of ὕδωρ, ὕδατος, *water*, and εἶδος, *form, reſemblance*, a name ſome authors give to the AQUEOUS humour of the eye, incloſed betwixt the cornea and uvea.

HYDATOSCOPIA, compounded of ὕδατος, the genitive of ὕδωρ, *water*, and σκοπέω, *I view, I conſider*, called alſo HYDROMANCY, a kind of divination, or method of foretelling future events, by means of water.

There is a natural or allowable kind of *hydatoſcopia*: it conſiſts in foretelling ſtorms, tempeſts, hurricanes, &c. from natural ſigns or indications in the ſea, air, clouds, &c.

HYDE *of land.* See HIDE.

HYDE-*gild.* See HIDE-*gild*.

HYDNOPHILLUM, or HYDNOPHYLLON, in *Botany*, a name given by the ancient Greeks to a plant which they tell us grew on thoſe places where the truffes or truffles lay underneath.

They have left us no deſcription of this plant; ſo that it is not eaſy to gueſs what it was; and the whole account ſeems ſo contrary both to their own opinions delivered in other places, and to truth, that there is reaſon to ſuſpect ſome error in the caſe. They tell us, that they were led by this plant to look for the truffles, and knew by it where they were. But we obſerve, that in places where truffles are, there grows no plant at all upon the ſurface: they alſo tell us the ſame thing in other places.

It is probable that ſome of the writers of this age confounded the truffle and the bulbonaſtanum, or earth-nut. In this caſe, the leaves of the latter would, indeed, ſerve as a certain indication; and the hydnophyllon would then be only another name for the bulbonaſtanum. See UNION.

HYDNUM, in *Botany*, the name of a genus of fungi, in the claſs of *apogamiæ*, called by Dillenius and Micheli, *erinacei*. Theſe are a ſort of horizontal funguſes, which always grow by the ſide to trees, &c. having no pedicle. There are three of this kind; the *auricle*, which is lamellated underneath; the *boletus*, which is porous underneath; and the *hydnum*, which is echinated, or beſet with pointed fibres on its under part. The three form diſtinct genera, comprehending ſeveral ſpecies in the Linnæan ſyſtem. See AGARICUS, BOLETUS, and FUNGUS.

HYDRA *of Lerna*, in *Mythology*, a terrible monſter, born of Typhon and Echidna, according to Heſiod; which was deſtroyed by Hercules. The poets repreſent it ſometimes as a ſerpent, branched out into ſeveral other ſerpents, and ſometimes with a human head, bearing ſerpents inſtead of hair; and they add, that when one of the ſerpents head were cut off, a double head ſprouted in its place.

This *hydra* with many heads is ſaid to have been only a multitude of ſerpents, which infeſted the marſhes of Lerna, near Mycenæ, and which ſeemed to multiply as they were deſtroyed. Hercules, with the aſſiſtance of his companions, cleared the country of them, by burning the reeds in which they lodged.

HYDRA, in *Aſtronomy*, a ſouthern conſtellation, conſiſting of a number of ſtars, imagined to repreſent a water ſerpent. The ſtars in *Hydra*, in Ptolemy's Catalogue, are twenty-ſeven; in Tycho's, nineteen; in Hevelius's, thirty-one; and in the Britannic Catalogue, fifty: the longitudes, latitudes, &c. whereof, are as follow:

HYDRA, in *Zoology*. See NATRIX.

HYDRA, in the Linnæan system, is a genus of zoophytes comprehending seven different species. See POLYPE.

HYDRAGOGUE, *Thydrogogus*, formed of *ὕδωρ*, *water*, and *ἄγω*, *to draw*, a species of purgative medicines; being such as are supposed peculiarly fitted to discharge serous or watery humours.

The strongest cathartics, Dr. Quincy observes, chiefly answer to the character of *hydragogues*; because by their forcibly shaking and vellicating the bowels, and their sympathy, they squeeze out water enough to make the stools appear little else.

The principal *hydragogues*, in the common opinion, are the juices of the roots of iris, of soldanella, mechoachan, jalap, &c. In the general, all fudorifics, aperitives, and diuretic medicines, are truly *hydragogues*.

HYDRANGEA, in *Botany*, a genus of the *decandria digynia* class. Its characters are these: the flower has a small permanent empalement of one leaf, and five roundish petals, which are equal; it has no flamina, which are alternately longer than the petal; under the flower is situated a roundish germen, which turns to a roundish capsule, crowned by two horned stigmas, divided transversely into two cells, filled with small angular seeds. We know but one species of this genus, which is a native of North America.

HYDRARGYROSIS, a term used by the chirurgical writers to express the anointing the body with a mercurial ointment, in order to the raising a salivation.

HYDRARGYRUM, *Thydrargyrus*, a name given to MERCURY, or quicksilver.

The word is formed of *ὕδωρ*, *aqua*, *water*, and *ἄργυρος*, *argentum*, *silver*; q. d. *water of silver*, on account of its resembling liquid or melted silver.

HYDRASPIS, *water shield*, or *water-buckler*, a machine of wood, invented by John-Christopher Wagenseil, a German, by the help of which a person may walk on the water, without fear of sinking. It encompasses the breast, forming the office of the shell in water-fowl, and is furnished with apertures for receiving a quantity of fmoke, or for preserving money, writings, or other valuable things, in case of an inundation. The person who uses it is provided with paddles for the feet, consisting of moveable flaps of very thick leather, which open and shut, and are fastened to a wooden sole, on which the foot rests, by an iron pin passing through their hinges. They are fastened to the feet by straps or thongs. The inventor of this machine made trial of it in the whirlpool of the Danube, where he moved about in the current without danger. He proposes that this machine should be used in a shipwreck, in escaping the danger of sudden inundation in passing a river, for the service of war, and in hunting and taking water-fowl, &c. Acta. Erud. ann. 1691. p. 46.

HYDRASTIS, *yellow root*, in *Botany*, a genus of the *polyandria polygynia* class. This genus of plants has neither calyx nor nectaria; the number of petals is three, and the fruit is a berry containing single-seeded kernels. There is only one species.

HYDRAULICS, that part of statics which considers the motion of fluids, and particularly water; with the application thereof in artificial water-works.

The word is derived from the Greek, *ὑδραυλις*, *sounding water*, formed of *ὕδωρ*, *aqua*, *water*; and *αὐλος*, *tibia*, *pipe* or *flute*: the reason whereof is this, that at the time of the first invention of organs, being unacquainted with the method of applying bellows to blow them, they made use of a cataract or fall of water to make a wind, and sound them.

To *hydraulics* belong not only the conducting and raising of water, with the constructing of engines for those purposes; but also the laws of the motion of fluid bodies, the nature of springs, the theory of the tides, &c.

Hydrostatics explain the equilibrium of fluids, or the gravitation of fluids at rest: upon removing that equilibrium motion enfues; and here *hydraulics* commences.

Hydraulics, therefore, *Suppose* hydrostatics; and the generality of writers, from the immediate relation between the two, join them together, and call them both either *hydraulics* or *hydrostatics*.

The laws of *hydraulics* the reader will find under FLUID.

The art of raising waters, with the several machines employed for that purpose, as *fyphons*, *pumps*, *syringes*, *fountains*, *jets d'eau*, *forcing-pumps*, &c. are described under SIPHON, PUMP, SYRINGE, FOUNTAIN, HYDROCASTERIUM, &c.

The principal writers who have cultivated and improved *hydraulics*, are Jo. Cera, in his Geometria Motus; Jo. Bap. Baliani, De Motu Naturali Gravium, Solidorum & Liquidorum; Mariotte, in his Mouvement des Eaux & autres Fluides; D. Gualtierini, in his Mensura Aquarum Fluentium, where the higher laws of *hydraulics* are reduced to practice; Sir Isaac Newton, in his Phil. Nat. Prin. Mathemat. Varignon, in the Memoirs of the Royal Academy of Sciences; Jurin, Belidor, Bernoulli, &c.

As to *hydraulic* machines, Hero of Alexandria is the first who has written on them. Of the moderns, the principal are Solomon de Caus, in a French treatise of Machines, and chiefly *hydraulic* ones; Casp. Scottus, in his Mechanica Hydraulico-pneumatica; De Chales, in his Mundus Mathematicus; Boeckler, in his Architectura Curiosa; Luc. Antonius Portius, Delagulier, Fergufon, &c.

HYDRAULO-PNEUMATICAL, a compound term, applied by some authors, to such engines as raise water by means of the spring of the air. See AIR, WATER, and ENGINE.

Mr. Boyle mentions a very pretty fountain, which he calls *hydraulo-pneumatical*; made by the spring of the air pressing up water in a pipe upon the air's being exhausted out of a receiver, and thus the weight of the atmosphere taken off. See FOUNTAIN.

HYDRELÆON, *Thydrelæum*, compounded of *ὕδωρ*, *water*; and *ἔλαιον*, *oil*, in *Pharmacy*, a mixture of common oil and water.

The *hydrelæon* was taken internally to excite vomiting; externally it is anodyne, and promotes suppuration.

HYDRENTEROCELE, *Thydrenterocele*, compounded of *ὕδωρ*, *water*; *ἔντερον*, *intestine*; and *κήλη*, *tumor*, in *Medicine*, an hernia, or tumour, occasioned by [illegible] of the intestines, and water along with [illegible] tum. See HYDROCELE.

HYDRIAPHORÆ, compounded of [illegible] *ferry*, among the *Athenians*, a [illegible] wives of strangers residing at Athens.

They were thus called, as being [illegible] cession of the festival *Panathenæa*, [illegible] tes. Potter, tom. i. p. 369, and 4[illegible]

HYDRINUS, a name given by some [illegible] TER, or serpent-stone.

HYDROCANISTERIUM, a [illegible] which spouts water plentifully, and with force, to be applied to the extinguishing of fires, and chollegrations of houses, &c. We have various contrivances to this effect: the first, and which, as it were, the basis

of all the reſt, is a pump incloſed in a ciſtula, or wooden veſſele filled with water, and mounted on wheels; the pump being wrought with long levers which come out of the ciſtula; and the water is raiſed directed to the place by means of a jointed tube.

The Dutch and others uſe a long flexible tube of leather, faſt-cloth, or the like, which they carry or conduct in the hand from one room to another as occaſion requires; ſo that the engine may be applied where the fire is only without-ſide, and does not burſt out to expoſe it to its external action. To improve on this original fire-engine, they have ſince contrived to make it yield a continued ſtream, by ſubſtituting a forcing or preſſing pump in lieu of the ſucking pump. See FIRE-*Engine*, and *Forcing* PUMP.

HYDROCANTHARUS, in *Zoology*. See *Water* BEETLE.

HYDROCARDIA, a term invented by Hildanus to expreſs a ſerous, ſanious, or purulent tumor of the pericardium.

HYDROCELE, *Υδροκηλη*, formed of *Υδωρ*, *water*, and *κηλη*, *tumor*, in *Medicine*, a ſwelling, or blowing of the *water* integument or ſkin of the ſcrotum, occaſioned by watery humours drained thither, and called alſo *hydrops ſcroti*, and *hernia aquoſa*.

Celſus, De Teſticulorum Natura & Morbis, lib. vii. cap. 18. has long ago obſerved that there are two ſpecies of this diſeaſe; the one is a dropſy of the membrana cellularis, otherwiſe termed *hydrops ſcrotalis*, and is formed by a collection of extravaſated lymph, depoſited and become ſtagnant in the numerous cavities of the cellular membranes of the ſcrotum. The other, commonly called the *hydrocele*, is occaſioned by a collection of extravaſated lymph chiefly confined in the cavity of the *tunica vaginalis teſtis*. In the former caſe, i. e. when a conſiderable quantity of extravaſated lymph is confined in the cells of the *tela cellularis*, or cellular membrane of the ſcrotum, the ſcrotum becomes uniformly enlarged; the teſticles cannot be felt, and the common integuments appear thickened, diſtended, pale, ſhining, and poliſhed, unleſs the ſkin be inflamed, and then the part becomes red. The penis often exhibits ſimilar appearances, and becomes conſiderably elongated and enlarged by the diſeaſe. Upon preſſure the tumor feels ſoft, the integuments aſſume an oedematous appearance, and for ſome little time afterwards there remains a depreſſion, or cavity on the part that was preſſed. This affection of the ſcrotum is moſt frequently a ſymptom of a dropſied habit, and very often accompanies the general anaſarca, and the particular collection within the abdomen, called the aſcites. On this account Mr. Pott is of opinion, that this diſeaſe is improperly ranked among the ſpecies of *hydrocele*. The relief which the patients can expect muſt be derived more from a proper regimen in their genite exercitia, and internal medicines, than from external operation and topical applications. However, when a retention of the fæces in the ſcrotum and penis become abſolutely neceſſary, a ſurgeon may aſſiſt his beſt endeavours to promote a temporary diſcharge of the redundant lymph, and thus to eaſe the pain, and to prevent mortification. The means of making this diſcharge are puncture and inciſion; the former is performed with the point of a lancet; the latter with a lancet or with a knife. Of theſe two methods of relief, that by ſimple puncture is much preferable to the other, as it is leſs painful in the operation, and leſs liable to pernicious conſequences. The fomentations proper to be uſed after the operation ſhould be of the moſt emollient kind, as heated cow's milk, or equal parts of hot penſil-barley, water and milk, or common ſoft water and milk; or, a decoction of bran, oat-meal, marſh-mallow leaves, or poppy-heads, prepared in water: the dreſſings ſhould be pledgets of lint dipped in warm ſweet oil, or warm linſeed oil, and they may be firſt thinly ſpread with yellow baſilicon, liniment of Arcæus, or ſuch digeſtive ointment. Over theſe pledgets ſhould be applied a cataplaſm of bread and milk made warm, and mixed with a ſufficient quantity of cloſe-bow ointment, or oil of olives, or freſh hog's lard; or, inſtead of this cataplaſm another may be uſed, compoſed of freſh linſeed meal and warm water. But in the caſe of a ſingle puncture, a ſuperficial pledget will be a ſufficient dreſſing. Mr. Pott, excluding this diſeaſe from the claſs of *hydrocele*, enumerates three different kinds, viz. 1. That which conſiſts of a collection of water in the cells of the tunica communis, or cellular membrane, cloſeloping and connecting the ſpermatic veſſels. 2. That which is formed by the extravaſation of a fluid in the ſame cells, and confined to one cavity or caſe, whilſt the reſt of the membrane remains in its natural ſtate. 3. That which is produced by the accumulation of a quantity of water in the cavity of the tunica vaginalis teſtis. The firſt ſpecies of *hydrocele*, when uncombined with any other diſeaſe, is perfectly local, is confined to the tunica communis, and does not at all affect the ſcrotum, the tunica vaginalis teſtis, or any other part. This complaint is without much trouble, and is ſeldom much regarded: whilſt it conſiſtences of a moderate ſize, the ſcrotal bag has no appearance of a diſeaſe; except that it ſeems rather fuller, and hangs ſomewhat lower on one ſide than the other; the teſticle with its epididymis may be diſtinctly felt in its natural ſtate; the ſpermatic proceſs is conſiderably larger than it ought to be, and feels like a varix, or like an omental hernia, according to the different ſize of the tumor: it has a pyramidal form, being broader at the bottom than at the top; and by continual preſſure it goes up, but drops down again on removing the preſſure. The ſmall degree of uneaſineſs that attends it is felt in the loins, and not in the ſcrotum: when it becomes large and troubleſome, it will require a ſuperficial ſurgical operation. The ſecond, or cyſtified ſpecies of *hydrocele*, is conſtituted by water contained in a bag, which is formed like the coats of all encyſted tumors, by mere preſſure and condenſation of the common membrane. This is a complaint by no means unfrequent, eſpecially in children. It has been often repreſented as a ſpecies of windruptures, or *PNEUMATOCELE*. It moſt commonly poſſeſſes the middle part of the proceſs, between the teſticle and groin, and is generally of an oblong figure; whence it has been compared to an egg, and to a fiſh's bladder. It is moderately tenſe, ſo that the fluctuation of the water within it is not eaſily perceptible; it gives no pain, and is attended with little inconvenience, unleſs it be very large. It has no communication either with the cavity of the belly above, or that of the vaginal coat of the teſticle below it. The teſtis and its epididymis may be diſtinctly felt below the tumor; the upper part of the ſpermatic proceſs in the groin is moſt frequently very diſtinguiſhable. It does not retain the impreſſion of the fingers, and a ſlight ſtroke upon it occaſions a ſound as if it contained only wind. The poſture of the patient produces no alteration in it, nor is it affected by his coughing, ſneezing, &c. and it has no effect on the diſcharge per anum. The diſeaſes with which it is moſt likely to be confounded are the *hydrocele* of the tunica vaginalis teſtis, and the true hernia; becauſe the parts within the groin, the ſpermatic proceſs, and the ſcrotum are the ſeat of all three: but it is diſtinguiſhed from the former by the tumor's being always above the teſticle, and by being the ſame to the touch in all parts of it, and feeling throughout like a diſtended bladder; and from the latter by the gradual increaſe of the ſwelling, by the indolent ſtate of it, by its being incapable of *reduction*, and being unaffected by the patient's coughing, &c. In young children, who are more ſubject to this diſeaſe than adults, it is often diſtended in a ſhort while by the effects of worm-fomentation, and preſerving an open belly. But if it does not diſperſe, the water may be diſcharged by the point of a lancet: whereas in the caſe of which, the cyſt becomes ſometimes ſo thick as to require diviſion through its whole length; and the operation muſt be performed with *great* eaſe, and *perfect* ſafety. In order to underſtand the nature and formation of the third ſpecies or *hydrocele*, which is confined to the vaginal coat or bag, which looſely inveſtes the teſticle, it is to be conſidered that the cavity of this tunic in a natural healthy ſtate, always contains a ſmall quantity of a fine fluid, exhaled by capillary arteries, and conſtantly abſorbed by veſſels deſtined to this uſe: but if the quantity of this fluid be too large, or if the regular abſorption of it be by any means prevented, it will be gradually accumulated, and by diſtending the containing bag form this diſeaſe. No period of life is exempt from this malady; adults and young children are ſubject to it, and infants are ſometimes born with it. Ruyſch is of opinion that it proceeds from a ſarcoſe ſtate of the ſpermatic veſſels, a circumſtance which is obſerved to attend this diſorder, whether it be the cauſe of it or not. The tumor in its firſt ſtate is rather round, and as it increaſes acquires a pyriform figure, with its larger extremity downward; it is ſometimes hard, and almoſt incompreſſible; at other times ſo ſoft and lax, that both the teſticle, and the fluid ſurrounding it, are eaſily diſcoverable. It is indolent to touch, though its weight will produce a ſmall degree of ſenſible uneaſineſs in the back. Some have laid great ſtreſs on the tranſparency of the tumor, but this is a very fallible criterion, neither can the colour of the ſkin be depended upon; but the principal circumſtance that diſcriminates the ſimple *hydrocele* of the tunica vaginalis from the anaſarcous ſwelling of the ſcrotum, from the encyſted *hydrocele* of the chord, and from the inteſtinal *hernia*, is the fluctuation of the tumor. The firſt is every where equal, tumid

and soft; and every where equally receives, and retains the impression of the fingers; the second, though circumscribed, not very compressible, and affording the sensation of fluctuation, yet does not pit, and is alike to the touch in all its parts: and in the third, if the testicle be distinguishable at all, it is found at the inferior part of the whole tumor.

The methods of cure in this species of *hydrocele* are reducible to two, viz. the palliative, which propoles to give present relief by discharging the fluid; and the radical, which aims at a perfect cure, without leaving a possibility of relapse. The inftruments commonly uſed in the former method are the bleeding or the impoſthume lancet, and the trocher. Mr. Warner prefers the impoſthume lancet to the trocher, becauſe it is the moſt eaſy and expeditious way of evacuating the fluid, and becauſe the tunica vaginalis does not ſuffer as it does from the canula of the trocher being left in the wound during the diſcharge of the lymph. But Mr. Pott thinks that the trocher is preferable to the lancet; becauſe by means of its canula it ſecures the exit of the whole fluid, without a poſſibility of prevention. The operation ſhould always be performed on that part of the tumor, where the tunica vaginalis and albuginea are at the greateſt diſtance from each other, and where the fluid muſt of courſe be accumulated in the greateſt quantity. When the lymph has been totally evacuated, a bit of ſoft lint ſhould be applied to the wound, and over the lint a piece of ſticking plaiſter; and if the ſcrotum has been conſiderably diſtended, it may be neceſſary to ſuſpend it in a bag-truſs. The radical method of cure is by inciſion, by cauſtic, by the puncture and tent, and by the ſeton; each of which operations has been adopted and recommended by different practitioners. Some have added a fifth kind of operation, viz. that of opening the tumor by inciſion, and then diſlecting away the whole of the tunica vaginalis; but this method is ſo tedious, painful, and dangerous, that it is now generally rejected.

The operation by inciſion is performed with a ſharp ſmall knife, having a convex edge and point, and a pair of probe-ſciſſars. The operator embracing the tumor on its upper part with one hand, makes a wound with his knife in the other hand, beginning at the upper and anterior part of the tumor, and continuing it to its inferior extent; by this inciſion the water is ſuddenly evacuated, and the tumor diſappears: but if the edges of the divided tunic project on each ſide of the ſcrotum, they muſt be clipped off with a ſharp pair of ſciſſars; and the ſciſſars may likewiſe be made uſe of to enlarge the wound if it ſhould be neceſſary. The wound muſt be dreſſed with dry lint, or with a pledgit of lint ſpread with ſome ſoft and cooling ointment, ſuch as the linimentum album, ung. ſaturninum, or the ung. ſtoracis ſimplex; over the lint apply a pledgit of ſoft tow ſpread with the ſame kind of ointment; ſuſpend the parts in a bag-truſs, and purſue the ſame methods for completing the cure.

In the operation by cauſtic, a piece of the common paſte cauſtic, rather leſs than a finger in breadth, properly ſecured by plaiſter, is applied to the whole length of the anterior part of the tumor; and when the eſchar thus produced, caſts off, or is diſſolved, an opening of nearly the ſame length is thereby intended to be made into the cavity of the tunica vaginalis teſtis; by which means the ſurgeon has an opportunity of applying ſuch dreſſings to the inſide of the laſt tunic, as ſhall by the generation of new fleſh, fill up and abolish its cavity.

The radical cure by the puncture and tent, is performed by making a puncture in the ſcrotum with a lancet or trocher, and when the contents of the tumor are evacuated, introducing a bit of lint of the ſize of the orifice, and about three fourths of an inch in length through the wounded ſcrotum and tunic; but it is neceſſary firſt to ſecure the tent by a piece of double thread paſſed through one end of it, that it may not ſlip into the cavity of the tunic; cover the tent with ſoft lint, and over the lint apply a bit of ſticking plaiſter; ſuſpend the parts in a bag-truſs; when an inflammation commences, remove the plaiſter, lint, and tent, and renew them as at firſt, a ſecond time. Report the operation as often as it may be found ſafe and expedient for producing a general inflammation of the part. The wound may be ſuperficially dreſſed with yellow baſilicon ſpread on a ſoft pledgit of lint; and the whole ſcrotum may be covered and immerſed in a cataplaſm, compoſed of ſtale crumbs of bread and milk, adding a ſufficient quantity of ſallad-oil, in order to keep the application moiſt and ſoft. In the operation by the ſeton, Mr. Warner recommends a ſilver needle of a convex form, about ſix inches long, and tipped with a ſharp ſteel-point. Through the eye of the needle draw a narrow ribband or tape, about ten or eleven inches long, ſoftened with oil or pomatum; introduce the point of the needle through the upper and anterior part of the tumor, or through its upper and exterior part, and its convex ſide towards the teſticle; direct it downwards to the lower end of the tunica vaginalis and ſcrotum, and there puncture the integuments quite through; then convey the needle and ligature downwards, till it may be properly ſecured. Let the ribband remain unmoved for forty-eight hours; obſerving to draw it upwards and downwards once or twice a day, as may be thought needful. Treat the patient in the manner already adviſed in the account of the other operations. See on this ſubject Pott's Treatiſe on the *hydrocele* in his chirurgical works, vol. ii. p. 197, &c. Warner's Account of the Teſticles, &c. p. 26, &c. Elſe's Treatiſe on the *Hydrocele* of the Tunica Vaginalis Teſtis.

HYDROCEPHALUS, *Υδροκεφαλος*, formed of *Υδωρ water*, and *κεφαλη*, a *head*, in *Medicine*, a watery head, or dropſy in the head.

The *hydrocephalus* is a congeſtion of water in the head, ſo as to diſtend and render it loſt.

There are two kinds of *hydrocephali*. The firſt, when the water is gathered between the ſkull and the ſkin, called *hydrocephalus externus*; the ſecond when it is collected between the ſkull and the brain, or in the ventricles of the brain, called *hydrocephalus internus*.

Children are much more liable to *hydrocephali* than adults; by reaſon their head is loſt, and has been much compreſſed in the womb, or perhaps, by their having been too roughly handled by the midwife: add that the bones of children's heads being very ſoft, and their ſutures not yet exactly cloſed, they eaſily open, and give way to an influx of water from without; whereas, in adults, the bones of the cranium are very hard, and cloſely bound together: nevertheleſs, inſtances occur in which they have been ſeized with this diſorder.

The internal *hydrocephalus* is a diſeaſe very difficult, if not abſolutely impoſſible to cure. It ſometimes ends in mortal convulſions, and ſometimes in lethargies, or apoplexies.

The head, in this caſe, is ſometimes extended to a prodigious bulk, ſo that the perſon cannot bear or ſuſtain it. Of this we have an extraordinary inſtance given us by Dr. Freind, of a girl two years old, whoſe head was twenty-ſix inches in circumference. Philoſoph. Tranſact. N° 318.

We owe to Mr. Hunauld, of the Royal Academy of Paris, ſome very ſingular and valuable obſervations on this remarkable ſubject. This gentleman, examining the head of a child which had died at ſeven months old of a *hydrocephalus*, found it larger in all parts, except before, than that of an adult. Toward the face, the ſkull was no larger than is natural at that age; but ſideways and behind, it had ſwelled to this monſtrous bulk. The water was included in the ventricles, and was in quantity a pint.

On conſidering what could be the time when this unhappy diſorder began, it appeared to that gentleman, that it did not happen till after the bones of the ſkull began to be joined to one another by the ſutures; for otherwiſe the head muſt have been in the ſame ſtate with thoſe in which the *hydrocephalus* has begun earlier; in which caſe, the bones of the ſkull ſeparate themſelves to a great diſtance one from another, and the membrane which unites them to one another is extremely extended. The beginning of this *hydrocephalus* muſt have been at a time when the bones of the ſkull, united by their ſutures, had already had time conſiderably to extend themſelves; and the action of the water on the ſides of the ventricles, and on the brain, forced the bones of the ſkull to take this unnatural growth. And from the whole, it is eaſy to conclude, that thoſe children in whom a *hydrocephalus* begins, before the bones of the ſkull are ſtrongly united, [illegible] time.

The effect which the water, contained in [illegible] had on the brain, in the caſe under conſideration, [illegible] ſerves to be remarked. The ſides of the [illegible] in a natural ſtate, applied cloſely [illegible] force leave any ſenſible cavity; [illegible] theſe ſides were ſo far ſeparated [illegible] as to contain a pint of water. It muſt [illegible] happened, that the ſubſtance of the [illegible] theſe ſides, muſt have been conſiderably [illegible] and the cortical ſubſtance muſt alſo have been greatly extended beyond its natural dimenſions. And, in order to be capable of this extenſion, it was found without any circumvolutions, and made only a flat even ſurface regularly of that extent and ſize that would reſult from the expanſion of all its circumvolutions. The medullary

substance formed a second even surface like the former. This was very thin, and lay under the former. The reason of this disposition of the parts of the brain in this case is obvious; for the pia mater not having in this case, the circumvolutions of the brain to follow, as in a natural state, formed of itself a flat substance upon the cortical part.

It is evident, from these observations, and from others in Vesalius and other authors, that the brain may, from accidental causes, become of a growth and figure very different from what it naturally would have had; and that the very bones of the skull are in like manner capable of assuming a different figure and growth, and that even after they have acquired a great deal of their natural thickness and hardness, and are capable of resisting, with considerable force, the accidents which tend to determine this unnatural growth in them: and applying this to the case of a tender foetus, in which the parts have yet scarce any degree of solidity or hardness, we shall see an easy account of all the unnatural configurations which anatomists sometimes meet with in the skulls of adults. Memoirs de l'Acad de Scienc. Par. 1740.

Dr. Fothergill observes, that the *hydrocephalus internus* is much more frequent than persons generally imagine; and this is the more to be lamented, as it has hitherto baffled the skill of our ablest physicians. A single instance only occurs under the care of Dr. Watson, out of a great number, in which a recovery was effected. It appears from several dissections, that the proximate cause of this disease is a collection of clear pellucid lymph, amounting in some cases to two, three, four, or five ounces, contained in the ventricle of the brain under the corpus callosum, from whence it is impossible to discharge it by any medicine, or operation hitherto discovered. Dr. Fothergill submits to consideration, whether this extravasated lymph may not proceed from the breach of a lymphatic. This conjecture is confirmed by its happening more commonly to healthy, active, lively children, than to such from whom in previous constitution, there is room to suspect any unequal or weakened absorption. Besides, accidents have often preceded this complaint. Dr. Watson is of opinion, that whenever this fluid is productive of disease and death, its effects arise not from any preternatural acrimony, but from the ventricles being overloaded with it; so that it forces the brain against the skull, and impedes the free passage of the blood through the vessels of the brain and its meninges: and, by its pressure disturbs the functions of the brain itself; and its effects on the optic nerve are easily seen in the sensibility of the retina, and at length in a loss of sight and dilatation of the pupil to its greatest extent. The same cause affecting the third pair of nerves, which are subservient to the motions of the eyes, occasions the irregular convulsive motions and distensions which are usually observed in that organ in the course of this disease. A greater degree of distension of the brain, and its compression from this fluid brings on general convulsions, and is most usually fatal. The disorders to which the *hydrocephalus internus* bears the nearest resemblance, are such as are supposed to proceed from worms; many of the same symptoms occur, and indicate the necessity of prescribing anthelmintics. Dr. Whytt supposes that this disease is gradually formed, and that it continues some weeks before it is fatal: but Dr. Fothergill has met with many cases of persons who were well, healthy, and active, that have been seized with it, and carried off in about fourteen days, nor has he seldom been able to trace the commencement of it above three weeks. The first complaint in this disorder is a pain somewhere below the head; most commonly about the nape of the neck and shoulders, often in the legs, sometimes, but more rarely in the arms; when the pain does not seem to affect any of the limbs, the head and stomach are most disordered. In the course of three, four, or five days, after children have been first seized, they have commonly complained of a very acute pain in the head, extending from the forehead from temple to temple; this is attended with occasional sickness and vomiting, irregular breathing, and much sighing. The pulse is full slower than it ought to be; and as the pain increases, becomes gradually slower and irregular. The first access of the disorder is often attended with feverish heat; afterwards the heat subsides till within a day or two of the dissolution of the patient; when the pulse becomes extremely quick, the breathing deep, irregular, and laborious, and the heat excessive and more general. The head and praecordia are always hot from the first attack. Every symptom almost that attends an irritating cause in the brain appears in its turn; still, pains in the limbs, sickness, and head-ach; short disturbed sleeps, startings, irregular pulse, watchfulness, and considerable dilatation of the pupils. The patient is unwilling to be disturbed, averse to light, takes things greedily, and can bear no posture but that of lying horizontally. The whites of the eyes are much seen when he is asleep; the urine and stools come away involuntarily; he often screams, and puts one or both hands to his head; at length the eye-lids become paralytic, and the iris immoveable. The heat of the head and trunk become excessive, a great heat and sweat spread over the whole body, respiration is altogether suspirious, the pulse trembling, and very quick; and sometimes a spasm terminates the disorder in death. Many of these symptoms are familiar to worm cases, teeth, and other irritating causes: but the pains in the limbs, and incessant head-ach, and sickness seem to be the most certain intimations of the danger. The patient in this disease is very restless; and the stools, which are procured with great difficulty, are commonly of a dark greenish colour, with an oiliness, or glossy bile, and singularly offensive. In the earlier stages of this disease, it is useful to treat it as if it proceeded from worms, or some irritating cause capable of being removed. Three or four grains of calomel, or more, according to the age and habit of the patient, with rhubarb, and the pulv. e scam. compos. are given to empty the bowels; and if the stomach appears to be loaded, one fourth, or one half of a grain of the emetic tartar may be joined with it, and the stomach washed with any suitable liquor. After this, it seems prudent to abate the vomiting by the saline absorbent medicines, adding a few drops of the tinctura thebaica as occasion requires; giving broth, thin decoctions of hartshorn shavings, and other proper support. Anthelmintics in broth are administered by way of clysters, and occasionally small doses of anodynes; a decoction of sem. santon. with thirty-eight or forty drops of ol. terebinth. in three or four ounces of broth; or aloes boiled with milk. Heating medicines, and a great degree of internal warmth increase the malady; when the disease proceeds from worms, the symptoms abate by this process: but if they continue it is of a more fatal kind. The most pressing symptoms however should be abated by the application of blisters, sinapisms, and embrocations externally, and by the less heating anodyne medicines internally; and the bowels should be always kept as much as possible free from impurities. Dr. Buchan also recommends diuretics, and such medicines as promote the secretion of urine: a discharge from the nose ought likewise to be promoted, by causing the patient to snuff the powder of afarum, white hellebore, or the like. London Med. Observ. and Inquiries, vol. iv. p. 40, &c. p. 78, &c. p. 321, &c. Whyt's History of the *Hydrocephalus*, in a tract at the end of his works. Buchan's Dom. Med. p. 617, edit. 1776.

In the external *hydrocephalus*, where the water is retained between the common integuments and the cranium, there is some hope of a cure, especially if it be not of very long standing. Internal medicines must be given: these must be cathartics, diuretics, and diaphoretics; and at the same time externally large compresses, covering the whole head, must be applied, dipped in lime-water and spirit of lavender, or Hungary-water. Bags of the dried herbs of lavender, marjoram, penny-royal, and the like herbs, may be wetted in the same liquors, and applied; and the frequent use of an errhine made of marjoram, lily of the valley, marum, and the like, should be recommended, as also the chewing of tobacco, to discharge the serosities in form of saliva. If these do not succeed, a blister must be tried behind the ears, on the occiput and neck, and cupping on the parts. Issues and setons also are of great use. And, in the cupping the scarification may be made very deep, and afterwards dressed with digestive ointments and precipitate, to keep up the discharge. Heister's Surgery, p. 355.

But even in this disease, as well as in the SPINA *bifida*, when, through ignorance or design, the integuments have been divided, and the contained fluid evacuated, life has continued but for a short time after the operation.

HYDROCERATOPHYLLON, *in Botany*, the name given by Vaillant, and many others, to a genus of plants called by Dillenius, dichotophyllum; and by Linnæus, in his General Plantarum, CERATOPHYLLUM. Vaillant, Act. Germ. 1719.

HYDROCHARIS, *frog's bit*, in *Botany*, the name of a genus of plants of the *decacia enneandria* class. The characters of the genus are these: the flowers are some male, others female; in the male the cup is a two-leaved oblong spatha, containing two flowers; the peculiar perianthium of each flower is composed of three leaves, of an oblong oval figure, hollow, and with membranaceous edges; the flower consists of three large petals, flat, and of a roundish figure; the stamina

are nine erect pointed filaments, disposed in three orders; the anthers are simple; the pistil has a sort of rudiment of a germen in the centre of the flower; in the female flowers there is no spatha, but the flowers grow each by itself; the perianthium and petals are the same as in the male; the pistil has a roundish germen placed under the cup, and from this arise six styles of the length of the cup: these are compressed and furrowed; the stigmata are bifid and pointed; the fruit is a coriaceous capsule of a roundish figure, containing six cells; the seeds are very numerous, oval and small and roundish.

HYDROCHÆRIS, in the Linnæan system of *Zoology*, a species of HOG found at Surinam. See CAPYBARA.

HYDROCHOOS, in *Astronomy*, derived from ὑδωρ, *water*, and χεω, *I run*. See AQUARIUS.

HYDROCORAX, in *Ornithology*. See BUCEROS, and CORVUS INDICUS.

HYDROCOTYLE, in *Botany*. See *Marsh* PENNYWORT.

HYDRODES *febris*, a fever, in which the patient is, from the beginning, afflicted with very copious and weakening sweats, and great weakness.

HYDRONAMICS, of ὑδωρ *water*, and δυναμις, *force*, is used for the science of the laws of the motion of FLUIDS, and denotes the same with HYDRAULICS.

HYDROGARON, a word used by some of the old authors for garum, or brine diluted with water, and used as a purge, taken in large quantities.

HYDROGRAPHICAL *Maps*, more usually called *sea charts*, are projections of some part of the sea, in plano, for the use of navigation.

In these are laid down all the rhumbs, or points, of the compass, the meridians, parallels, &c. with the coasts, capes, islands, rocks, shoals, shallows, &c. in their proper places, proportions, &c.

Christopher Columbus, the first great discoverer of America, was a man that earned his living by making and selling *hydrographical maps*. He happened to be heir to the manuscript journals of a noted pilot, one Alonzo Sanchez de Huelva, captain of a ship, who, by chance, had been driven by a storm to the island of St. Domingo, and died at Columbus's house soon after his return. This gave Columbus the first hint to attempt a discovery of the West-Indies, in which he succeeded.

For the construction of the several kinds of *hydrographical maps*, see CHART.

For their use, see SAILING.

HYDROGRAPHY, compounded of ὑδωρ, ὑδατος, *water*, and γραφω, *I describe*, that part of geography which considers the sea; principally, as it is navigable.

Hydrography teaches how to describe and measure the sea; it gives an account of its tides, counter-tides, currents, soundings, bays, gulfs, &c. as also of its rocks, shelves, sands, shallows, promontories, harbours, distances, &c. from port to port; with all that is remarkable, either out at sea, or on the coast.

Some of the best authors use the term in a more extensive sense; so as to denote the same with *navigation*.

In this sense *hydrography* includes the doctrine of sailing; the art of making sea charts, with the uses thereof; and every thing necessary to be known, in order to the safest and most expeditious performance of a voyage. See SAILING.

Hydrography is the most perfect of all the mathematical sciences; there being scarce any thing wanting to its perfection, but the discovery of the longitude.

The Jesuits Riccibius, Fournier, and de Chales, have written on the subject of *hydrography*.

In France they have professors of *hydrography* established in all their sea-ports, who are to instruct the youth intended for the sea, in all the parts of navigation, sailing, steering, &c. with the several branches of mathematics necessary thereto; as arithmetic, and the doctrine of the sphere, and trigonometry.

They are also professors, and teach gratis; having salaries allowed them by the king. They are also charged with the examination of pilots, &c.

HYDROLEA, in *Botany*, a genus of the *pentandria digynia* class: the calyx is five-parted, the corolla rotated, and the fruit is a double-celled and double-valved capsule. There is only one species.

HYDROLOGY, compounded of ὑδωρ, *water*, and λογος, *discourse*, denotes that part of natural history, which examines and explains the nature and properties of WATER in general.

HYDROMANCY, of ὑδρομαντια, compounded of ὑδωρ, *water*, and μαντια, *divination*, the art, or art, of divining, or foretelling future events, by means of water.

Hydromancy is one of the four general kinds of DIVINATION; the other three, respecting the other elements; viz. fire, air, and earth; are denominated pyromancy, aeromancy, and geomancy.

Vario mentions the Persians as the first inventors of *hydromancy*, adding, that Numa Pompilius, and Pythagoras, made use thereof.

This species of divination was performed in various ways: sometimes they used invocations, and magic ceremonies, in consequence of which they discovered the names of certain persons, or events, which they wished to know upon the water: sometimes they suspended a ring by a thread over a vessel full of water, and struck the sides of the vessel with it a certain number of times: they also formed presages by casting small stones into still water, and observing the circles hereby formed on the surface of the water: by examining the various agitations of the waves of the sea; by observing the colour of the water, and the figures represented in it, &c. &c. See an account in Delrio Disquis. Magic. lib. iv. quest. 6. sect. 3.

The writers in optics furnish us with divers *hydromantic* machines, vessels, &c.

To construct an *hydromantic* machine, by means whereof an image, or object, shall be removed out of the sight of the spectator, and restored again, at pleasure, without altering the position, either of the one or the other. Provide two vessels, ABF, CGLK (*Tab.* IV. *Hydraulics*, *fig.* 42.); the uppermost filled with water, and sustained by three little pillars, one whereof, BC, is hollow, and furnished with a cock B. Let the lower vessel CL be divided by a partition HI, into two parts; the lower whereof may be opened, or closed, by means of a cock at L.

Upon the partition place an image, which the spectator in O cannot see, by a direct ray GL.

If now the cock B be opened, the water descending into the cavity CL, the ray GL will be refracted from the perpendicular GR to O; so that the spectator will now see the object by the refracted ray OG. And again, shutting the cock B, and opening the other P, the water will descend into the lower cavity HL; whence, the refraction ceasing, no rays will now come from the object to the eye: but, shutting the cock P again, and opening the other B, the water will fill the cavity again, and bring the object in sight of O afresh.

To make an *hydromantic* vessel, which shall exhibit the images of external objects, as if swimming in water. Provide a cylindrical vessel ABCD (*Tab.* IV. *Hydraulics*, *fig.* 43.) divided into two cavities by a glass EF, not perfectly polished: in G apply a lens convex on both sides: and in H incline a plain mirror, of an elliptic figure, under an angle of 45°; and let IH and HG be something less than the distance of the focus of the lens G; so that the place of the images of an object radiating through the same may fall within the cavity of the upper vessel: let the inner cavity be blackened, and the upper filled with clear water.

If, now, the vessel be disposed in a dark place, so as the lens be turned towards an object illuminated by the sun, its image will be seen as swimming in the water.

HYDROMEL, ὑδρομελι, compounded of ὑδωρ, *water*, and μελι, *honey*, a drink made of water and honey, nearly in equal quantities; called also by the Greeks, μελικρατον.

When this liquor has not fermented, it is called *simple hydromel*; and *compound*, when other ingredients are added to the water and honey, in order to improve and exalt the flavour and virtues.

When it has undergone the spirituous fermentation, it is called the *vinous hydromel*, or MEAD and METHEGLIN. To induce this fermentation, nothing is necessary but to dilute the honey sufficiently in water, and to expose the liquor to a convenient degree of heat.

Hydromel is the common drink of the Poles and Russians. Diodorus Siculus, lib. v. and Aristotle, relate, that the Celtiberi, and Taulantii, ancient people of Illyria, drank *hydromel* instead of wine.

HYDROMELON, a name given by the ancients to a liquor prepared with one part of honey, [illegible] with the juice of quinces, and two parts of [illegible] set in the sun during the dog-days.

HYDROMETER, compounded of ὑδωρ [illegible] μετρεω, *I measure*, an instrument wherewith [illegible] gravity, density, velocity, force, or [illegible] of water.

That wherewith the specific gravity [illegible] is determined, is often called an areometer.

The general principle on which the [illegible] of the *hydrometer* depends, has been [illegible] under the article *specific* GRAVITY: for it has been [illegible] that a body specifically lighter than several fluids will serve to find out their specific gravities; because it will sink deepest in the fluid whose specific gravity is the least.

Thus,

Thus, let AB, (*Tab.* II. *Pneumatics, fig.* 25.) be a small even glass tube, hermetically sealed, having a scale of equal divisions marked upon it, with a hollow ball of about an inch in diameter at bottom, and a smaller ball C under it, communicating with the first. Into the little ball put mercury or small shot, before the tube be sealed, so that it may sink in water below the ball, and stand upright, the divisions on the stem shewing how far it sinks. If this instrument be dipped in common water and sink to D, it will sink only to E in salt water; but in Port wine it will sink to F, and in brandy under proof, it will perhaps sink to B. It is evident that an *hydrometer* of this kind will only shew that one liquid is specifically heavier than another; but the true specific weight of any liquid cannot be determined without a calculation for this particular instrument, the tube of which should be truly cylindric, and not tapering as they commonly are. Besides, these instruments will not serve for fluids, whose densities are considerably different. With a view of remedying these and some other inconveniences, Mr. Clarke constructed a new *hydrometer*, for the use of dealers in brandy and spirits, that they might be able to determine, by inspection, whether any spirituous liquor be proof, above proof, or under proof, and exactly in what degrees. This instrument is made of copper, because ivory imbibes spirituous liquors, and glass is apt to break. It consists of a brass wire about one-fourth of an inch thick, passing through and soldered into the copper ball B 6, (see *fig.* 30.) The upper part of the wire is filed flat on one side for the stem of the *hydrometer*, and marked at *m*, to which division it exactly sinks in proof-spirits. There are two other marks A and B; the one shewing that the liquor is one-tenth above proof, when the instrument sinks to A, and the other indicating one tenth under proof when it emerges to B; a brass weight, as C, having been previously screwed on to the bottom at *c*. There is a great variety of weights of different sizes, as K, &c. adapted to liquors that differ more than one tenth from proof, and for determining the specific gravities of all such liquors as occur in trade, as well as for shewing the specific gravities of all fluids quite to common water. The round part of the wire above the ball may be marked across, as in *fig.* 27; so that with the weight as C, which fits the instrument for the trial of river water, in which it sinks to R W, it may serve for wines or other waters: thus in spring water it will sink to SP; in mineral water to M I; in sea-water to S E; and in the water of salt springs to S A: and the marks *h r, r a, p s, m e*, denote the divisions to which the instrument descends in Bristol water, rain water, Port wine, and Mountain wine, respectively. Phil. Trans. abr. vol. vi. p. 326, &c.

Dr. Desaguliers contrived an *hydrometer*, for determining the specific gravities of different waters to such a degree of nicety, that it would shew when one kind of water was but one forty thousandth part heavier than another. This instrument (see *fig.* 28.) consists of C B *b*, a hollow glass ball of about three inches in diameter, with a small ball under it of about an inch in diameter. To a short neck at C there is fixed a brass head, with a fine screw, into which the piece C *c* is to be screwed; and this piece is joined to a wire C A, about one fortieth part of an inch in diameter, and ten inches long, which is divided into inches, and tenths of inches. Having put a certain quantity of small shot into the ball *b*, so that when the head C *c*, with its wire C A, is screwed on, it shall sink as far as D, e. g. five inches, in river or soft spring water, we may know by observing how far this *hydrometer* sinks lower in one kind of water than another, their different specific gravity to a forty thousandth part, which corresponds with one tenth of an inch marked on the stem AC. For let the *hydrometer* float in water in the jar IKLM, and the surface of the water cut the stem at D, a grain weight laid on the stem at A, will cause the instrument to sink, till the mark D of the stem settles one inch under the surface; and therefore, a grain depresses it an inch. The *hydrometer* weighs four thousand grains, and every inch of the graduated wire weighs ten grains; and, therefore, the part of it D C B *b c* D must weigh three thousand nine hundred and fifty grains. But it is known from the principles of *specific* GRAVITY, that a bulk of water equal to D C B *b* c D, the immersed part, weighs just as much as the whole *hydrometer*, or four thousand grains: and, therefore, this instrument serves to compare together the different bulks of four thousand grains of water, according to their different specific gravities: and since the whole instrument is sunk an inch by the weight of one grain, and the instrument will stand at one tenth of an inch, the difference indicated by it in waters in which it floats, it is evident that it will distinguish the tenth of a grain in four thousand, or the forty thousandth part of the whole bulk of water. By altering the quantity of shot in the ball *b*, the instrument may be prepared for the comparison of any other two liquors that are nearly of the same specific gravity. Desaguliers, &c. vol. ii. p. 234. This instrument is capable of still greater exactness, by making the stem of a flat thin slip of brass or of steel, by which means we increase the surface without diminishing the solidity: on one side of this stem may be several marks denoting the depths to which the instrument would sink in various sorts of water, as rain water, river water, &c. and on the other side may be the divisions to which it would sink in lighter fluids, as hot-bath water, Bristol water, Port wine, &c. but in determining the strength of spirituous liquors, a cylindric stem is best.

Mr. Quin has lately constructed an *hydrometer*, recommended by many distillers, &c. on account of its accuracy, which requires only eighteen weights used on the top of the instrument, to shew all the under and over proofs to the certainty of one pint in a hundred gallons, from proof to seventy gallons to one hundred over proof, and to fifty gallons in a hundred under proof, which would require nine hundred and fifty-eight weights, besides forty-five air weights, according to the old construction of Clarke's *hydrometers*. The weights are numbered 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 30, 40, 50, 100, 200, 300, 600 grains. He has also formed a table shewing the degrees of the thermometer, and the number of grains corresponding with each degree; the number of grains required for each strength; the over proofs, or the quantity of water necessary to reduce one hundred gallons of spirit to proof, with the former manner of expressing the several preparations, as one to two, one to three, &c. and likewise the under proofs. There is one circumstance, which deserves particular attention in the construction and graduation of *hydrometers* for determining the precise strength of different brandies, and other spirituous liquors. M. Reaumur, in making his spirit thermometers discovered, that when rectified spirit and water, or phlegm, the other constituent part of brandy, are mixed together, there appears to be a mutual penetration of the two liquors, and not merely juxtaposition of parts; so that a part of the one fluid seems to be received into the pores of the other; thus e. g. if a pint of rectified spirit be added to a pint of water, the mixture will be sensibly less than a quart. The variations hereby produced in the bulk of the mixed fluid, render the *hydrometer*, when graduated in the usual way, by equal divisions, an erroneous measure of its strength; because the specific gravity of the compound is found not to correspond to the mean gravity of the two ingredients. M. Montigny constructed a scale for this instrument in the manner before suggested by Dr. Lewis, on actual observation of the sinking or rising of the *hydrometer* in various mixtures of alcohol and water, made in certain known proportions. Hist. de Acad. Roy. Sciences, &c. Paris, for 1768, Memoire lv. Neumann's Chem. by Lewis, p. 450, note r.

M. de Luc has lately published a scheme of the construction of a comparable *hydrometer*, so that a workman after having constructed one upon his principles, may make all others similar to each other, and capable of indicating the same degree on the scale, when immersed in the same liquor of the same temperature.

For this purpose he proposes to use an *hydrometer* of the common construction, such as is represented in *fig.* 29. made of flint glass; because glass is a substance which undergoes the least change of bulk by heat, and its changes are the most regular. The ball *a* should be one and a half inch in diameter, with which should communicate a small hollow cylinder *b*, containing such a quantity of quicksilver for a ballast, that the instrument may sink nearly to the top in the most spirituous liquor, made as hot as possible. To the ball *a* is cemented a thin brass tube silvered over, or a silver tube *c c*, made perfectly cylindrical, by drawing it through a hole. This tube, or *branch*, as he calls it, should be long enough to admit the immersion of a small part of it in the less spirituous liquors, e. g. wine reduced to congelation. In order to determine a standard for the construction of the scale of this instrument, he forms a weak spirit of wine, by mixing one part of water with six parts of such spirits of wine as fire gun-powder, or linen steeped in them. He also finds the specific gravity of this mixture, at the temperature of fifty-four and a half of Fahrenheit's thermometer, by a nice hydrostatical balance. Having dipped the *hydrometer* into this spirit of wine, at the fixed temperature, he marks upon its branch or stem with a thread, the point to which it sinks; then preparing a sort of brandy stronger than the common, by mixing three parts of water with seven parts of this same spirit of wine, he determines the point on the stem to which the instrument would sink in it at the same temperature, and marks it with a thread. These

points, viz. 45 and 15 in the figure, are the fixed points of the *hydrometer*. The interval between them may be divided into thirty equal parts, each of which will represent one thirtieth part of the total effect of the superadded water, or the specific gravity of the liquor. This fundamental interval in instruments for common use may be divided into fifteen parts, which will then be double degrees. In order to find a convenient place for the 0 of this scale, M. De Luc proposes to reduce one of the wines of which brandy is commonly made, to the temperature of water in ice, and dipping the *hydrometer* in it, to observe how much higher it will ſtand than the inferior fixed point. This excess of emersion, compared with the fundamental scale, and reduced to the nearest number of degrees which will be an aliquot part of it, will be a proportional quantity invariably fixed, to be added to the scale below the inferior fixed point, for determining the place of 0. e. g. let this excess of emersion be about 15°, or half the fundamental scale; then one should constantly add half the fundamental distance below the inferior fixed point, and thence begin to count the degrees: so that 0 would be at the bottom of the whole scale, the inferior fixed point would be at 15°, the superior at 45°, and the scale could be prolonged at the top as much as may be necessary for the essays of the most spirituous liquors. Another scale may be applied on the opposite side of the ſtem, for trying merely the specific gravity of the liquids in which the *hydrometer* may be dipped. The particular fixed points of this scale, *e. g. d d*, may be taken in any two liquids, whose specific gravities, tried by the hydrostatic balance, ſhall have a convenient relation, and the ſpace between thoſe two points will be divided into a convenient number of equal parts. For the correction on account of the differences of heat, M. De Luc would take a liquor of mean ſpirituosity, *e. g.* a mixture of one part of water, and ſeven parts of the ſpirits of wine determined by the hydrostatic balance; reduce this liquor to the temperature of 45° of Fahrenheit; plunge into it the *hydrometer* already graduated, and observe the point to which it ſinks; he proposes afterwards to heat the liquor to 65°, and then to observe the ſinking of the inſtrument. From this observation a table might eaſily be formed, in which we might expreſs in degrees of the *hydrometer*, the effects of the differences of heat corresponding to each degree of the thermometer, beginning from a fixed point: or, a particular ſcale might be prepared for experiments of this nature, by changing the number of degrees contained between the fixed points, in order to eſtabliſh an eaſy proportion between them and the degrees of the areometer; and thus the correction might be made without tables. If an *hydrometer* of this kind were come into general uſe, the police of the places in which the trade of ſpirituous liquors is carried on, might take cognizance of it; and keep the public ſtandard of the *hydrometer* or areometer, as they keep the ſtandards of weights and meaſures. Phil. Trans. vol. lxvii. part i. art. 20. p. 360, &c. M. Le Roi has alſo publiſhed a propoſal for conſtructing comparable *hydrometers*. Hiſt. de l'Acad. des Scien. Paris, for 1770. Mem. 1.

HYDROMETRIA, HYDROMETRY, the menſuration of water, and other fluid bodies, their gravity, force, velocity, quantity, &c.

Hydrometria includes both HYDROSTATICS and HYDRAULICS.

The term is modern, but very little in uſe. The firſt inſtance where we meet with it, is in the year 1694, when a new chair, or profeſſorſhip, of *hydrometry*, was founded in the univerſity of Bologna, in favour of S. Guglielmini, who had carried the doctrine of running waters, with reſpect to rivers, canals, dykes, bridges, &c. to an unuſual length.

HYDROMPHALUS, Υδρομφαλος, formed of ὑδωρ, *water*, and ομφαλος, *navel*, in *Medicine*, a tumor in the navel, ariſing from a collection of water.

The *hydromphalus* is diſtinguiſhed from other tumors of the navel, by its being very ſoft, and yet not tractable and obedient to the touch, ſo as to diminiſh or enlarge, by compreſſing it. When viewed, placed between the eye and the light, it is found tranſparent.

The *hydromphalus* is to be diſcuſſed by emollient and reſolutive medicines. It is alſo cured by a puncture made in the middle of the navel. See DROPSY.

HYDROMYSTES, or HYDROMISTA, compounded of ὑδωρ, *water*, and μυστης, *a perſon ſet apart for the offices of religion*, a name anciently given to certain officers in the Greek church, whoſe buſineſs was to make the *holy* WATER, and ſprinkle it on the people.

HYDROPARASTATÆ, or HYDROPARASTA, in *Eccleſiaſtical Hiſtory*, a ſect of heretics, the followers of Tatian; called alſo Encratitæ, Apotactitæ, Succophori, Severiani, and Aquarians.

The word is formed of ὑδωρ, *water*, and παρισταμι, *I preſent*.

The *hydroparaſtatæ* were a branch of Manichees, whoſe diſtinguiſhing tenet was, that water ſhould be uſed in the euchariſt inſtead of wine.

HYDROPHANÆ, in *Natural Hiſtory*, the name of a genus of the ſemi-pellucid gems.

The word is derived from ὑδωρ, *water*, and φαινω, *to ſhine*; the diſtinguiſhing character of their ſtones being, that they become lucid on being plunged into water.

They are ſemi-tranſparent ſtones, compoſed of cryſtal and earth, the latter ingredient being in large proportion, and mixed but imperfectly, as in the chalcedony, and giving a general milky or cloudy look to the maſs, but conſiderably opake, and not capable of a fine poliſh, but appearing of a duſky and ſoul ſurface, till thrown into water, in which they become lucid, and in ſome degree tranſparent, and either in part or wholly change their colour, which returns to them again when taken out and dried. Of this genus we know only two ſpecies, one a whitiſh grey, without veins, called *lapis nubilus*, and OCULUS *mundi*; and the other a whitiſh-grey one, variegated with yellow, and with a black central nucleus, called by authors the OCULUS *bidi*.

HYDROPHOBIA, Υδροφοβια, compounded of ὑδωρ, *water*, and φοβος *fear*, in *Medicine*, an averſion or dread of water; a ſymptom ariſing in perſons bitten by a mad dog, or other animal.

This diſeaſe is alſo called *rabies canina*.

Some have obſerved that this kind of madneſs ſcarce ever appears in any animals except dogs, foxes, and wolves, unleſs by contagion.

The marks whereby to know that a dog is mad, are, his neither eating nor drinking, looking ſad and ſullen, running at any thing in his way, whether man or beaſt, known or unknown, with a murmuring noiſe, but without barking, nodding as if he were overpowered with ſleep, and endeavouring to hide himſelf. Theſe are the ſymptoms, according to Boerhaave, in the firſt ſtage of madneſs, when a bite, though dangerous, is leſs malignant than in the next ſtage, when he begins to pant, hangs out his tongue to diſcharge a great quantity of froth from his mouth, which he keeps always open; alternately walking ſlowly and running; his eyes are dull and red, and full of tears; his tongue is of a leaden colour; he becomes faint and weak, falling down and riſing up, and attempting to fly at every thing; and then he becomes mad and furious; this ſtage ſeldom continues thirty hours, when death terminates the diſeaſe, and a bite received now is reckoned incurable. In the firſt ſtage Boerhaave ſays, that he remembers and reſpects his maſter, but forgets him in the ſecond ſtage. Other ſymptoms of madneſs are the dog's being avoided by other dogs that ſmell him, their running away with horror, and the tone of his voice when he barks, which is hoarſe and hollow. This diſeaſe is moſt common after long dry hot ſeaſons; and ſuch dogs as live upon putrid ſtinking carrion, without having ſufficient water, are moſt liable to it.

Baldus, a famous lawyer, died of the *hydrophobia* four months after his being bit in the lip by a little dog. And the ſame is ſaid of Diogenes the Cynic.

Though the term *hydrophobia* in ſtrictneſs only denotes this one ſymptom of dreading water, yet it is frequently applied to the whole diſeaſe conſequent on ſuch a bite, with all its ſymptoms.

The hiſtory of this horrible diſeaſe, as given by Celſus, Aurelianus, Dr. Mead, Etmuller, Liſter, &c. is as follows: the bite of a mad dog is attended with this ſurpriſing circumſtance, that its effects frequently do not diſcover themſelves till after the cauſe is forgot; the wound itſelf cloſing and healing like any other common wound. But ſome time after direful ſymptoms enſue; uſually they commence in about forty days, ſometimes in ſixty, ſometimes not till ſix months, and ſometimes not till a year, or even two years. However, if no ſign of the diſorder manifeſts itſelf in about ſix weeks, the patient is commonly concluded to be ſafe. The firſt thing obſerved, is a wandering pain reſembling the rheumatiſm throughout the whole body, chiefly about the wounded part, which begins to fill, inflame, and diſcharge as lchor; the patient grows melancholy, dreadful, and melancholy, and very promptly complaining of every thing, as the ambient air, the bedclothes of his bed-cloaths, &c. His ſtrength is quickly loſt, and ſucceeded by convulſive agitations; he frequently ſometimes complained of a pain in the ſtomach, the countenance ſorrowful, the face pale and contracted, ſweat breaks out about the temples; an unuſual flow of ſaliva at length comes on with a dryneſs of the fauces, a fouluſs of the tongue, and ſometimes fœtid breath. From the beginning there is a peculiar ſtricture and heavineſs

vinefs in the breaſt, a ſtruggling for breath, a ſighing, naufea and vomiting. The puſſe of the patient intermits, and ſomewhat of a tremor is obſerved, with convulſions of the nerves and tendons: along with theſe he feels an inward heat and thirſt, watchfulneſs becomes continual, the mind is more diſturbed, and a deliriom approaches: at laſt the grand ſymptom appears which denominates the diſeaſe, viz. the aquæ pavor, or dread of water, ſo that he cannot bear ſo much as the ſight of any liquid, without the utmoſt conſternation; much leſs can he ſwallow the ſmalleſt drop. At firſt a conſtriction of the gullet is perceived; ſpaſms are produced by the ſight of liquors; and when the ſurface of any liquid is touched, a ſtrangulation may be felt in the throat, the ſtomach is inflated, the larynx is outwardly ſwelled which riſes ſuddenly, and as ſuddenly falls. Lond. Med. Obſ. vol. v. p. 195, and App.

This is the pathognomonic ſign of the diſeaſe's being come to its height; and never happens till two or three days before the patient's death; the diſeaſe being then, by the unanimous conſent, both of ancient and modern phyſicians, abſolutely incurable.

With this there are other concomitant ſymptoms: he foams at the mouth, his eyes glare, he cannot ſwallow his ſpittle without pain; and his penis is conſtantly erected, attended with involuntary emiſſions of ſemen and frequent calls to make water: ſome bark and howl like dogs; and actually fancy themſelves transformed into thoſe creatures; and in the height of their madneſs, are ready to fly upon, and tear to pieces the by-ſtanders: yet it is obſerved, that in the intervals of reaſon, the patient is afraid of doing harm, and warns thoſe that are about him of their danger. Palmarius obſerves, that the *hydrophobous* patient cannot bear to look in a glaſs, or any tranſparent body; and adds, that he never recovers, unleſs he knows himſelf in a glaſs; this being a ſign that the poiſon has not laid hold of the vital parts. Towards the laſt ſtage of the diſeaſe, theſe ſeveral ſymptoms increaſe; ſtrength fails, cold ſweats come on, the tightneſs of the breaſt increaſes, and the patient ſoon expires in ſpaſms.

An abſolute bite or wound is not at all neceſſary to produce this terrible diſeaſe: the ſaliva of a mad dog, &c. being able to convey the diſeaſe by mere contact, or application to the ſkin.

For the nature and cauſe of the *hydrophobia*; Dr. Mead, from ſeveral hiſtories of particular caſes, concludes, that it is the effect of a particular kind of inflammation in the blood, accompanied with ſo great a tenſion and dryneſs of the nervous membranes, and ſuch an elaſticity and force of the fluid with which they are filled, that the moſt common repreſentations are made to the mind with too great effect; ſo that the uſual impreſſions on the organs cannot be ſuffered. Hence that timorouſneſs, unaccountable anxiety and diſquietude, which are always the forerunners of the dread of liquids; as alſo the pain often felt in making water; and the ſtrange averſions ſometimes found in patients at the ſight of any thing white, the retina being hurt and grieved by the lively impreſſions of that colour thereon. Nor is it hard to conceive, that when the ſaliva is hot, and the throat inflamed and dry, the ſwallowing of drink ſhould cauſe ſuch an intolerable agony.

M. Tauvry, from a nice diſſection and examen of the parts of a perſon who died of this diſorder, conjectures that the ſaliva and bile are the fluids firſt infected; and that the patient vomiting a mixture hereof, the throat becomes excoriated thereby; and hence that horror for all foods; and particularly for fluids, becauſe theſe diſſolve thoſe grievous ſalts contained in the ſaliva and bile. He adds, that the nature of the poiſon is ſuch, as diſſolves the balſamic and nutritious part of the blood, whence the veins are dried up, ſo as not eaſily to admit any blood from the arteries; and the arterial blood by this means ſuſtaining the action and impreſſion of its veſſels for ſo long a time, is ſtill farther diſſolved, attenuated, and ſpiritualized; and thus ſent, in too great quantity, and with too great rapidity to the brain; whence thoſe convulſions, diſtractions, &c.

As to the cure of the *hydrophobia*, Dr. Mead, after Galen, recommends in this as in other venomous caſes, to enlarge the wound, made by the bite, by a circular inciſion, to apply a cautery to it, and to keep it open for at leaſt forty days. But if this method ſeem too cruel, it may ſuffice to extract the poiſon by clapping a cupping-glaſs on the place, having firſt made a deep ſcarification. The doctor adds, he has known a perſon freſh-bitten, happily ſaved by the ſole application of the unguentum *Ægyptiacum* made exceedingly hot.

If theſe external precautions have not been uſed, or not in time, recourſe muſt be had to internal remedies; alexipharmics muſt be drank; amongſt which the aſhes of river lobſters, or cray-fiſh, are principally extolled by all the ancient phyſicians; to which Galen aſſures, nobody had ever died who uſed this remedy. Theſe aſhes to be taken to the quantity of one or two ſpoonfuls every day for forty days ſucceſſively, either alone or with gentian root and frankincenſe, in wine.

But the frequent and ſudden plunging of the patient over head and ears in the ſea-water after the bite, has been generally reckoned the beſt and ſureſt preſervative againſt this diſeaſe, without ſufficient reaſon. See MADNESS.

Etmuller recommends cardiacs and alexipharmacs, but all in a double doſe, and being continued; and garlick, rue, and ſalt to be beat together, and applied in form of a cataplaſm over the wound. Purging with hellebore and mercurius dulcis is alſo good; and cantharides are a ſort of ſpecific. Scarifying is commended; and after the ſcarification, an onion roaſted under the aſhes is to be applied. But the ſtrangeſt remedy, he adds, is burning the place affected with a red-hot iron, which effectually removes all the malignity. If the phyſician be not called till late, a cupping-glaſs is to be applied very hot; an iſſue near the place may likewiſe be of ſervice. Sir Theodore Mayerne gives the following preſcriptions for the bite of a mad dog: pluck the feathers from the breaſt of an old cock, and apply it bare to the bite; if the dog were mad, the cock will ſwell and die; and the perſon bitten will do well; if the cock dies not, it is a proof the dog was not mad. Philoſoph. Tranſ. N° 191.

The members of the Royal Academy of Sciences furniſh us with various inſtances of perſons cured of the diſeaſe by various means. M. Poupart mentions a woman perfectly recovered by bleeding her to deliquium, binding her in a chair for a year, and feeding her all the time with bread and water. M. Borger relates, that, of ſeveral perſons bitten, two were cured by bleeding them in the forehead. M. du Hamel adds, that he has known ſalt-water applied on the wound, effect a cure. Divers caſes are produced of thoſe cured of the aquæ pavor, by being overwhelmed with a great quantity of water; and one by being only tied to a tree, and two hundred pails of water thrown on him. But the beſt inſtance is that of M. Morin: a maid of twenty years of age, having all the ſymptoms, was bathed in a tub of river-water, wherein a buſhel of ſalt had been diſſolved. They plunged her in naked again and again, till harraſſed almoſt to death, they then ſet her ſitting in it quite ſenſeleſs. When ſhe came to herſelf, ſhe was ſurpriſed to find herſelf looking at the water without any concern. Hiſtoire de l'Acad. an. 1709.

Vinegar is recommended by Dr. Kramer as a ſpecific againſt the *hydrophobia*, eſpecially if ſome powder of cantharides is mixed with it. The receipt given by him is, to boil from four to ten grains of the fine powder of cantharides in an ounce and an half, or two ounces of the beſt vinegar; which is to be given warm to the patient. Commerc. Norimb. 1735, hebd. 5183.

The *hydrophobia* appears to be a diſorder primarily and principally nervous, from the ſhying pains, the tightneſs of the præcordia, the difficulty of ſwallowing, the horror on approach of water, the great ſenſibility diſcovered on the impreſſion of air, &c. and other ſymptoms that attend it. Boerhaave and Mead apprehend, that the poiſon is conveyed into the conſtitution by means of the nervous fluid; but Dr. James, in his Treatiſe on Canine Madneſs, more rationally ſuppoſes that the cellular membrane is the receptacle of this as well as ſome other infections, which may be conveyed to the blood by thoſe abſorbing veſſels, which are diſtributed to every part of the body, and preſerve a conſtant communication between the cellular membrane and blood-veſſels. The cure of this dreadful diſeaſe has been commonly attempted by ſuch means as deſtroy nervous or ſpaſmodic irritation, or that peculiar acrimony that occaſions the diſorder. Opium, muſk, mercury, the warm bath, &c. have been preſcribed for this purpoſe.

For an account of various medicines, and the method of treatment recommended in this diſorder, ſee the article MADNESS, *from the bite of animals*.

The *hydrophobia* is a ſymptom in ſome fevers, and particular inflammations, &c.

HYDROPHORIA, formed of ὕδωρ, *water*, and φέρω, *I bear*, in *Antiquity*, a feaſt or funeral ceremony, held among the Athenians, and people of Ægina, in memory of thoſe who periſhed in the deluge of Deucalion and Ogyges.

HYDROPHTHALMIA, a name by which ſome have called the PROLAPSUS *oculi*, when owing to a quantity of aqueous humours.

HYDROPHYLACIA, of ὕδωρ and φυλάσσω, *I keep*, a word uſed by Kircher, and ſome others who have written in

the same system, to express those great reservoirs of water which he places in the Alps, and other mountains, for the supply of the rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the oeconomy of the universe.

HYDROPHYLLUM, in *Botany*, see *Water* LEAF.

HYDROPHYSOCELE, formed of ὑδωρ, *water*, φυσα, *I cause flatulence*, and κηλη, *rupture*, a term used by some authors for a sort of hernia, or rupture, occasioned by a mixture of water and flatulencies.

HYDROPIC, ὑδρωπικος, formed of ὑδωρ, *water*, and ὠψ, *face*; a tropical patient, or a person swelled and bloated with the abundance of water.

HYDROPIPER, in *Botany*. See PERICARIA.

HYDROPNEUMOSARCA, a word used by some writers in surgery, to express a tumor filled partly with water, partly with flatulencies, and partly with flesh.

HYDROPS, ὑδρωψ, of ὑδωρ, *aqua*, and ὠψ, *vultus*, in *Medicine*. See DROPSY.

HYDROPS *ad matulam*, a term sometimes used for a DIABETES.

HYDROPOTA, of Υδροποτης, formed of ὑδωρ, *water*, and ποτης, *a drinker*, of πινω, *I drink*, in *Medicine*, a person who drinks nothing but water.

It has long been controverted among physicians, whether or no the *hydropotæ* lived longer than other persons? See DRINK.

HYDROPYRETOS, formed of ὑδωρ, *water*, and πυρετος, *fever*; a word used by some authors to express a malignant fever, attended with very copious sweats. Some make it the same with the sudor Anglicus, or SWEATING *sickness*.

HYDRORHODINON, formed of ὑδωρ, *water*, and ῥοδον, *rose*; a name given by the ancients to a mixture of water and oil of roses; this, as it was at once cooling and emetic, was very much used by the ancients, to provoke vomiting after the taking of poisons.

HYDROROSATON, in the writings of the ancient physicians, a name given to a drink made of water, honey, and the juice of roses. The proportions were four pounds of roses, five pints of water, and two pints of honey.

HYDROSARCA, of ὑδωρ, *water*, and σαρξ, *flesh*, in the writers of surgery, a word used to express a tumor, composed partly of water, and partly of flesh.

HYDROSCOPE, ὑδροσκοπιον, formed of ὑδωρ, *water*, and σκοπεω, *I consider*; an instrument anciently used for the measuring of time.

The *hydroscope* was a kind of water-clock, consisting of a cylindrical tube, conical at bottom; the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out of the vertex of the cone, pointed out the hour.

Synesius describes the *hydroscope* at large in one of his letters. See CLEPSYDRA.

HYDROSELINUM, in *Botany*, a name given by some authors to SMALLAGE.

HYDROSTATICAL *Balance*, a kind of balance contrived for the easy and exact finding the *specific* GRAVITIES of bodies, both liquid and solid.

The instrument is of considerable use in estimating the degree of purity of bodies of all kinds; the quality and richness of metals, ores, minerals, &c. the proportions in any mixture, adulteration, or the like; of all which the specific weight is the only adequate test.

The *hydrostatical* balance is founded on this theorem of Archimedes, that a body heavier than water weighs less in water than in air, by the weight of as much water as is equal to it in bulk. Whence, if we subtract the weight of the body in water from its weight in air, the difference gives the weight of as much water as is equal in magnitude to the solid proposed.

Having, therefore, two bodies, the one firm, the other fluid, together with the weight of each apart; to find their proportion, divide the greater by the lesser; the quotient compared to one, that is, unity, will be the antecedent of the proportion desired.

The instrument, with its apparatus, is represented *Tab.* W. *fig.* 43 and 44. *Hydrostatics* and *Hydraulics*, and needs little description. See GOLD.

AB is a nice balance, turning with a small part of a grain, and furnished with a long examen D, for determining the exact horizontal position of the balance.

1. To find the specific gravity of a fluid: hang to the end B of the beam the little scale S, and to the bottom of the scale S, by a horse-hair, which is of the same specific gravity with water, the glass bubble G, which must be specifically heavier than any fluid except mercury. To the opposite end A of the beam hang a brass scale E, which is a counterpoise to the bubble G immersed in water; but when the bubble hangs out of the water, a weight must be laid on E to keep it *in æquilibrio*, which weight will be equal to what the bubble lost in water, or to a bulk of water equal to the bubble; when rain water is used, this weight will be a thousand grains. Then fill a cylindrical vessel I, about two thirds with common water; and when the bubble is let into it, the beam will remain in a horizontal position, if the water be of the same specific gravity as that in which the bubble was adjusted; if it be not, there will be a variation, which is to be corrected by means of little weights for that purpose. Having thus adjusted the bubble in water, the specific gravity of any other fluid will be found by weighing the bubble in it; and since you always weigh so much of the liquid as is equal to the bulk of the bubble, if there be any difference between such quantity and the like quantity of water, it will be discovered by putting weights into the ascending scale. E. gr. if red Port wine be put into the vessel I, the bubble will sink and require the addition of ten grains in the scale E, when the balance has been adjusted in rain water, for restoring the equilibrium; which shews that Port wine is lighter than rain water ten parts in a thousand, or one hundredth part. If proof brandy be used, seventy-seven grains will be required to restore the equilibrium, and therefore brandy, or proof spirits, weighs seventy-seven parts in a thousand, or one thirteenth part less than rain water. But in a denser medium G would rise; and if sea water be used, twenty-six grains must be put into the scale S to restore the equilibrium, which shews that sea water is twenty-six parts in one thousand, or one thirty eighth part, heavier than rain water.

2. To find the specific weight of a solid: instead of the bubble, hang on the glass bucket K, *fig.* 44, which, with its suspending piece H, will be *in æquilibrio* with the counterpoising scale E. Having weighed the solid in air in the bucket, by counterpoising it with weights on the scale E, note its weight; but because not only the solid to be tried, but the glass bucket itself will lose of its weight when immersed in water, you must restore to the bucket the weight that it loses by being immersed, that the body in it alone may be examined: this is done by means of the piece F, which weighs just as much as a bulk of water equal to the bucket; and being slipped on the suspending piece at H, it not only restores to the bucket what it had lost by being immersed in water, but makes a scale for receiving weights, in order to restore the equilibrium to the solid contained in the bucket, and to shew how much it has lost of its weight in water. When many bodies are to be weighed *hydrostatically*, it is best to weigh them all in the air successively, and set down their weights before you begin to weigh them in water, because it would be troublesome to dry the bucket every time. Care must also be taken that no bubbles of air adhere to the bodies weighed in water, which would make them lighter.

Dr. Desaguliers has added a contrivance to this machine to make it more nice, see *fig.* 45. S, S, S, are three screws which serve to set the foot and them upright; and OM is a string and plummet, whose point hanging over M, shews when the piece P C is truly vertical. There is also a piece EO, which has a fit to compare with the examen D playing in the notches C *c*. Desag. Exp. Phil. vol. ii. p. 196.

Mr. Martin proposes the following construction of an accurate *hydrostatical* balance. A B, see *fig.* 46, is the foot on which it stands; C D, a pillar supporting a moveable brass plate E F, fastened thereto by the screw in the knob *c*. In the end of this plate is fixed an upright piece I K, supporting another plate G H, which slides backwards and forwards thereon, and is moveable every way about it. In the end of this plate at H, is fixed (by a nut beneath) a wire L M, taped with a fine thread from one end to the other; upon this moves the swan-neck flip of brass N O, to which a very exact balance is hung at the point N; to one of whose scales P is appended the heavy body R, by a fine horse-hair or piece of silk S: the weight of the said body R in the air is expressed by the weights put into the scale Q to make an equilibrium therewith, which being destroyed by immerging the solid in the fluid T V, contained in the vessel W V, is again restored by weights put into the scale Q. So that the weights in the scale Q compared with those in the scale P, shew at once the specific gravity of the solid R to that of the fluid T V.

For several other constructions of this instrument, designed for greater accuracy than that of the common sort, the reader may consult 's Gravesande's Physices Elem. Math. &c. tom. i. lib. 3. cap. 3. The specific gravities of small weights may be determined by suspending them in loops of horse hair, or silk threads, to a hook at the bottom of the scale of the common *hydrostatical* balance. E. g. if a guinea suspended in air be counterbalanced

by

by 129 grains in the oppofite fcale; and upon being immerfed in water, requires 7½ grains to be put into the fcale over it, in order to reftore the equilibrium; we thus find that a quantity of water of equal bulk with the guinea, weighs 7½ grains, or 7.21; by which divide 129, the weight of the guinea in air, and the quotient, or 17.893, fhews that the guinea is fo many times heavier than its bulk of water. Whence, if any piece of gold be tried, by weighing it firft in air, then in water, and if upon dividing the weight in air by the lofs in water, the quotient is 17.793, the gold is good; if the quotient be 18. or between 18 or 19, the gold is very fine; but if it be lefs than 17½, the gold is too much alloyed with other metal. If filver be tried in this manner, and found to be eleven times heavier, than water, it is very fine; if it be 10½ times heavier it is ftandard; but if it be any lefs weight compared with water, it is mixed with fome lighter metal, fuch as tin.

In order to find the fpecific gravities of thofe bodies that are lighter than water, let an upright ftud be fixed into a thick flat piece of brafs, and in this ftud let a fmall lever, whofe arms are equally long, turn upon a fine pin as an axis. Let the thread which hangs from the fcale of the balance be tied to one end of the lever, and a thread from the body to be weighed, tied to the other end. This done, put the brafs and lever into a veffel; then pour water into the veffel, and the body will rife and float upon it, and draw down the end of the balance from which it hangs, then put as much weight in the oppofite fcale as will raife that end of the balance, fo as to pull the body down into the water by means of the lever; and this weight in the fcale will fhew how much the body is lighter than its bulk of water. Ferguſon's Lect. p. 166, 8vo.

HYDROSTATIC *bellows*, in *Hydroſtatics*, is a machine for demonſtrating the upward preſſure of FLUIDS, conſiſting of two thick oval boards A, (*Tab.* IV. *Hydroſtatics*, &c. *fig.* 47.) each about fixteen inches broad, and eighteen inches long, covered with leather, to open and fhut like a common bellows, but without valves, only a pipe B, about three feet high, is fixed into the bellows at *c*; let water be poured into the pipe at C, which will run into the bellows, and feparate the boards a little. Then lay three weights ***, *c*, *d*, each weighing a hundred pounds upon the upper board; and pour more water into the pipe B, which will run into the bellows, and raife up the board with all the weights upon it; and if the pipe be kept full until the weights are raifed as high as the leather, which covers the bellows, will allow, the water will remain in the pipe, and fupport all the weights upon it; even though it fhould weigh no more than a quarter of a pound, and thefe three hundred pounds; nor will all their force be able to cauſe them to defcend and force the water out of the top of the pipe. The reaſon of this will appear, if we conſider that if a hole be made in the upper board, and a tube be put into it, the water will rife in the tube to the fame height as it rifes in the pipe; and would rife as high by fupplying the pipe in as many tubes as the board could contain holes. Now, fuppofe only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe B, and that the pipe holds juſt a quarter of a pound of water; if a perſon puts his finger upon the hole, and the pipe be filled with water, he will find his finger to be preſſed upward with a force equal to that of a quarter of a pound. As the ſame preſſure is equal upon all equal parts of the board, each part, whoſe area is equal to the area of the hole, will be puſhed upward, with a force equal to that of a quarter of a pound: the ſum of all which preſſures againſt the under ſide of an oval board, ſixteen inches broad, and eighteen inches long, will amount to three hundred pounds; and, therefore, ſo much weight will be raiſed up and ſupported by a quarter of a pound of water in the pipe. Hence if a man ſtands upon the upper board, and blows into the bellows through the pipe B, he will raiſe himſelf upon the board; and the ſmaller the bore of the pipe is, the eaſier he will be able to raiſe himſelf; and then by putting his finger upon the top of the pipe, he can ſupport himſelf as long as he pleaſes; provided that the bellows be air-tight. Mr. Ferguſon has deſcribed another machine, which may be ſubſtituted inſtead of this common *hydroſtatical bellows*; A B C D, *fig.* 48, is an oblong ſquare box, in one ſide of which is a round groove, as at *a*, from top to bottom, for receiving the upright glaſs tube I, which is bent to a right angle at the lower end as at *i*, in *fig.* 49. and to that part is tied the end of a large bladder K, which lies in the bottom of the box. Over this bladder is laid the moveable board L, *fig.* 48. and 50. in which is fixed an upright wire M; and leaden weights N N, to the amount of ſixteen pounds, with holes in their middle, are put upon the wire over the board, and preſs upon it with all their force. The croſs bar *p* is then put on to ſecure the tube from falling; and keep it in an upright poſition; and then the piece E F G is to be put on, the part G ſliding tight into the dove-tailed groove H, to keep the weights N N horizontal, and the wire M upright, which is received into a round hole *e*, in the part E F. There are four upright pins in the four corners of the box within, each almoſt an inch long, for the board L to reſt upon, in order to keep it from preſſing the ſides of the bladder below it cloſe together at firſt. The whole machine being thus put together, pour water into the tube at top, and the water will run down the tube into the bladder below the board, and after the bladder has been filled up to the board, continue pouring water into the tube, and the upward preſſure of the bladder will raiſe the board with all the weight upon it, even though the bore of the tube ſhould be ſo ſmall, that leſs than an ounce of water would fill it. *Ferguſon's Lectures, Supplement* 1767, p. 16.

Bradley's HYDROSTATICAL *Inſtrument*, is a new invention for weighing money, and diſcovering its defect either of weight or purity.

It conſiſts of a thin flat braſs ruler, about half a foot long; on each ſide of which are two graduated lines, thoſe on the upper ſide marked A and W (*ſee Tab.* IV. *Hydroſtatics*, *fig.* 51. N° 1.) and thoſe on the other ſide B and W, *ibid.* N° 2. There are alſo a ſmall chain and pincers, wherein to fix the piece of money intended to be weighed and proved, together with two pair of centre pins, marked A and B, *ibid.* N° 2 and 3. being the points of ſuſpenſion of the rod when uſed; whereof the former pair A are to be uſed for proving all pieces of gold under thirty-ſix ſhillings value; and the other pair, marked B, for all pieces from thirty-ſix ſhillings to ſeventy-two ſhillings, or three pounds twelve ſhillings. Laſtly, there is a ſliding piece, or index C, *ibid.* N° 3. by the motion of which backward or forward until the point of equilibrium is diſcovered, the value of any piece ſuſpended in the pincers is found upon the graduated lines already mentioned. Of theſe lines thoſe marked A and B are called ſtatical lines, as being calculated for weighing the piece in air, and thoſe marked W W, are called *hydroſtatical* lines, as ſerving to point out the alloy or adulteration of the piece weighed. A whole diviſion on each line is equal to the weight or value of one ſhilling in gold; a half diviſion to ſix pence, and a quarter diviſion to three pence.

To prove a guinea: firſt ſuſpend it in the pincers, and then placing the inſide of the ſliding piece C to twenty-one on the line A on the upper ſide of the ruler, which muſt move freely on the centre pin marked A, and if the guinea and ſliding piece exactly balance each other, the guinea is full weight; if not move the ſlider backwards or forwards until they equiponderate; when the diviſion cut by the inſide of the ſlider is the true weight of the gold; and if it reſts for inſtance, at twenty and a half, then the guinea weighs only twenty ſhillings and ſix pence. In the next place, to prove the alloy of this piece, let the ſlider be brought to diviſion twenty and a half, upon the *hydroſtatical* line marked W, for whatever diviſion is cut by the ſlider in weighing on the ſtatical line, it muſt be placed at the ſame on the *hydroſtatical* line adjoining. Then let the piece, together with the pincers, and the braſs link whereon it is ſuſpended, be immerſed in water (*ibid.* N° 3.) as far as the notch on the ſaid link; if then the inſtrument acts in equilibrio, or the piece ſink deeper in the water, the guinea is ſtandard gold; but if the ſlider muſt be moved farther backward before it will equiponderate, the guinea is adulterated. If it is alloyed with ſilver, allow two ſhillings for every penny it wants in the *hydroſtatical* weight; and then if the number of pence the piece is deficient in weight *hydroſtatically*, when doubled, exceed the number of ſhillings it weighs ſtatically, it may be concluded to be adulterated with ſome baſer metal than ſilver. However, a more ſpeedy method of diſcovering whether a piece of gold be adulterated or not, without moving the ſlider more than once, is this: when the piece is weighed ſtatically, bring the ſlider to the diviſion on the *hydroſtatical* line expreſſing its weight; and immerſing the piece and pincers as before, ſo that the ſurface of the water may be exactly at the mark on the long link, if the inſtrument does not then equiponderate, gently lower the hand that holds the fluid, until the inſtrument comes to an equilibrium; at which time, if the guinea be a counterfeit, great part of the pincers will appear above the water; if a 36s. piece be tried, not only the pincers, but a ſmall part of the coin, will appear above the ſurface, if the piece be counterfeit. This laſt method is ſufficiently near the truth for common practice.

If there is occaſion to weigh and prove a very ſmall piece

of gold, as 2 s 2 l. 3d. 4s. 6d. &c. the method is, to put the fold pieces in the pincers, with fome other piece that has been approved before; by which means the weight and alloy of the fmall piece may be eaſily diſcovered, as above. If the piece be above 36l. the ſlider is to be placed according to the diviſions of the ſtatical and *hydroſtatical* lines on the under ſide of the inſtrument, which are fitted to the ſtandard of the mint; by which a guinea weighs 129 grains.

HYDROSTATICS, compoſed of ὕδωρ, *water*, and στατικὸν, *ſtatics*; of στατὸς, *ſtant*, *ſtanding*, of ἵστημι, *ſto*, *I ſtand*; *hydroſtatics* being conceived as the doctrine of the EQUILIBRIUM of liquors), is the doctrine of gravitation in fluids; or that part of mechanics which conſiders the weight or gravity of fluid bodies, particularly of water, and of ſolid bodies immerged therein.

To *hydroſtatics* belong whatever relates to the gravities and equilibria of liquors, with the art of weighing bodies in water, in order to eſtimate their ſpecific gravities.

Mr. Boyle has applied *hydroſtatics* to good purpoſe, in examining and proving the goodneſs and purity of metals, minerals, and other bodies, particularly fluids, in an expreſs treatiſe entitled, Medicina Hydroſtatica.

The laws of *hydroſtatics*, with the application thereof, ſee delivered at large under the articles FLUID and *Specific* GRAVITY.

Hydroſtatics are frequently confounded with *hydraulics*, on account of the affinity of the ſubjects; and ſeveral authors chuſe to treat of the two promiſcuouſly.

The oldeſt writer on *hydroſtatics* is Archimedes, who firſt delivered the laws thereof in his book De inſidentibus humido. Marin Ghetaldus firſt brought his doctrine to experiment, in his Archimedes promotus; and from him Mr. Oughtred took the greateſt part of what he has given us on this ſubject. The celebrated M. Paſchal has written an excellent treatiſe on this ſubject, entitled, Traité de l'Equilibre des Liqueurs & de la Peſanteur de l'Air. M. Mariotte, in a French treatiſe, publiſhed at Paris in 1686, Of the Motion of Water, and other Fluids, gives moſt of the propoſitions of *hydroſtatics* and hydraulics, proved by reaſon, and confirmed by experiments. The Jeſuit F. Tertius de Lanis, in the third tome of his Magiſterium Naturæ & Artis, lays down the doctrines of *hydroſtatics* more amply than they are elſewhere found. F. Lamy, in the ſecond part of his mechanics, entitled, Traité de l'Equilibre des Liqueurs, delivers the fundamental laws of *hydroſtatics* and hydraulics; and the like is done by Dr. Wallis, in his Mechanica. Laſtly, Sir Iſaac Newton gives ſome of the ſublimer matters, in the ſecond book of his Philoſoph. Nat. Princip. Mathematic.

HYDROTICS, formed of ὕδωρ, *water*, in *Medicine*. See HYDROPIC.

HYDRUS, or *Water Serpent*, in *Aſtronomy*, is a ſouthern conſtellation, including ten ſtars; the longitudes, latitudes, &c. of which, are as follow:

Names and ſituations of the ſtars.	Signs	Longit.		Latitude		Magnitude.
		°	′	°	′	
In the head.	♓	8	4	34	64	3
1ſt in the neck	♒	25	6	36	57	5

Southern	♓	27	52	56	76	5

HYEMAL *ſolſtice*, the ſame with *winter ſolſtice*. See SOLSTICE.

HYEMANTES, in the *Primitive Church*, offenders who had been guilty of ſuch enormities, that they were not allowed to enter the porch of the churches with the other penitents, but were obliged to ſtand without, expoſed to all the inclemency of the weather.

HYES, in *Mythology*, a ſurname given to Bacchus, from the name Hye given to his mother Semele; or, according to others, becauſe her feaſt commonly happened in a rainy ſeaſon; from ὗω, *to rain*. The Athenians worſhipped Jupiter under the character Pluvialis, and erected an altar to him on mount Hymetta.

HYGEIA, in *Mythology*. See HEALTH.

HYGIEINE, Ὑγιεινὴ, formed of ὑγιὴς, *ſound*, *healthy*, that branch of medicine which conſiders *health*, and diſcovers proper means and remedies, with their uſe, in the preſervation of that ſtate.

The objects of this branch of medicine are, the NON-NATURALS. See AIR, DIET, EXERCISE, &c.

Hygieine, more largely taken, is divided into three parts; PROPHYLACTICS, which foreſees and prevents diſeaſes; SYNTERETICS, employed in preſerving health; and ANALEPTICS, whoſe office is to cure diſeaſes, and reſtore health.

HYGRA, of ὑγρὸς, *moiſt*, a name given by the ancients to what they called liquid plaſters, in oppoſition to thoſe called xeria, or dry ones. Theſe firſt were a ſort of liniments.

HYGROCIRSOCELE, compounded of ὑγρὸς, *moiſt*, and κιρσοκήλη, *tumor varicoſus*, in *Medicine*, a branch of a vein ſwelled with ill blood, or other humours; or a varicous tumor of ſome of the veins of the teſtes, attended with a gathering of water in the ſcrotum.

HYGROMETER, or NOTIOMETER, compounded of ὑγρὸς, *moiſt*, and μέτρον, *meaſure*, a machine, or inſtrument, whereby to meaſure the degrees of drineſs, or moiſture, of the air.

There are divers kinds of *hygrometers*; for whatever body either ſwells or ſhrinks by drineſs or moiſture, is capable of being formed into an *hygrometer*. Such are woods of moſt kinds, particularly aſh, deal, poplar, &c. Such alſo is cat-gut, the beard of a wild oat, &c.

The beſt and moſt uſual contrivances for this purpoſe are as follow.

HYGROMETER, *conſtruction of*. Stretch an hempen cord, or a fiddle-ſtring, as AB (ſee *Tab. II. Pneumatics*, *fig.* 30) along a wall, bringing it over a truckle or pulley, B; and to the other extreme D, tie a weight E, into which fit a ſtyle, or index, FG. On the ſame wall fit a plate of metal HI, divided into any number of equal parts; and the *hygrometer* is complete.

For it is a matter of undoubted obſervation, that moiſture ſenſibly ſhortens the length of cords and ſtrings; and that as the moiſture evaporates, they return to their former length; and the like may be ſaid of a fiddle-ſtring. The weight, therefore, in the preſent caſe, upon an increaſe of the moiſture of the air, will aſcend; and, upon a diminution of the ſame, it will deſcend.

Hence, as the index FG will ſhew the ſpaces of aſcent and deſcent, and thoſe ſpaces are equal to the increments and decrements of the length of the cord or gut, ABD, the inſtrument will diſcover whether the air be more or leſs humid now than it was at another given time.

Or thus: if a more ſenſible and accurate *hygrometer* be required, ſtrain a whip-cord, or fiddle-ſtring, over ſeveral truckles, or pullies, A, D, E, F, and G (*fig.* 31.); and proceed with the reſt as in the former example. Nor does it matter whether the ſeveral parts of the cord AB, CD, DE, EF, FG, be parallel to the horizon, as expreſſed in the preſent figure, or perpendicular to the ſame. The advantage of this, above the former *hygrometer*, is, that we have a greater length of cord in the ſame compaſs; and the longer the cord, the greater its contraction and dilatation.

Or thus: faſten a twiſted hempen cord, or fiddle-ſtring, HW, by one end, ſuſtaining a weight W (*fig.* 32.) to an iron hook; and let the other end deſcend upon the middle of an horizontal board, or table, AB, and fit an index, L. Laſtly, from the centre B deſcribe a circle; which divide into any number of equal parts.

Now, it is matter of obſervation, that a cord or gut twiſts itſelf as it is moiſtened, and untwiſts again as it dries. Mr. Molyneux, ſecretary of the Dublin ſociety, writes, that he could perceive this alternate twiſting and untwiſting in a cord, by only breathing on it eight or ten times, and then applying a candle toward it. Hence, upon an increaſe or decreaſe of the humidity of the air, the index will ſhew the quantity of twiſting or untwiſting; and, conſequently, the increment or decrement of humidity, or drineſs.

Thoſe Dutch toys, called weather-houſes, where a ſmall image of a man, and one of a woman, are ſet to point the ends of an index, are conſtructed upon the ſame principle. For the index being ſuſtained by a ſmall twiſted cargus, turns backwards or forwards, bringing out the man in wet weather, and the woman in dry.

Or thus faſten one end of a cord, or fiddle-ſtring, AB (*fig.* 33.) to a hook, H; and to the other end faſten a ball, B, of a pound weight. Draw two concentric circles on the ball, and divide them into any number of equal parts: fit a ſtyle, or index, NO, into a ſmall ſupport, N, ſo as the extremity O may almoſt touch the diviſions of the ball.

Here, the cord or gut twiſting or untwiſting, as in the former caſe, will indicate the change of moiſture, &c. by the ſucceſſive application of ſeveral diviſions of the circles to the index.

Or

Or thus: provide two wooden *frames*, AB and CD, *fig.* 34.) with grooves therein; and between those grooves fit two thin leaves of ash, AEFC, and GBDH, so as they may eaſily ſlide either way. At the extremes of the frames, A, B, C, D, confine the leaves with nails, leaving between them the ſpace EGHF, about an inch wide. On I faſten a ſlip of braſs dented, IK; and in L a little dented wheel, upon whoſe axis, on the other ſide of the machine, an index is to be put. Laſtly, from the centre of the axis, on the ſame ſide, draw a circle, and divide it into any number of equal parts.

Now, it being found by experience, that aſhen wood readily imbibes the moiſture of the air, and ſwells therewith; and as that moiſture ſlackens, ſhrinks again; upon any increaſe of the moiſture of the air, the two leaves AF and BH, growing turgid, will approach nearer each other; and, again, as the moiſture abates they will ſhrink, and again recede. Hence, as the diſtance of the leaves can neither be increaſed nor diminiſhed without turning the wheel L, the index will point out the changes in reſpect of humidity and drineſs.

It is to be noted, that all the *hygrometers* above deſcribed become ſenſibly leſs and leſs accurate; and, at length, undergo no ſenſible alteration at all from the humidity of the air. The following is much more laſting; though no *hygrometer* will ſerve for years, like a barometer and thermometer; but whatever be the ſubſtance of which it is made, will be ſo altered as to become in a great degree uſeleſs.

Take the MANOSCOPE deſcribed under that article, and inſtead of the exhauſted ball E, (*fig.* 35.) ſubſtitute a ſponge, or other body, which eaſily imbibes moiſture. To prepare the ſponge, it may be neceſſary firſt to waſh it in water; and when dry again, in water or vinegar, wherein ſal ammoniac, or ſalt of tartar, has been diſſolved, and ſet it dry again.

Now, if the air become moiſt, the ſponge growing heavier, will preponderate; if dry, the ſponge will be hoiſted up, and, conſequently, the index will ſhew the increaſe or decreaſe of humidity of the air.

In the laſt mentioned *hygrometer*, Mr. Gould, in the Philoſophical Tranſactions, inſtead of a ſponge, recommends oil of vitriol, which is found to grow ſenſibly lighter or heavier, in proportion to the leſſer or greater quantity of moiſture it imbibes from the air; ſo that being ſuſtained in the moiſteſt weather, it afterwards retains or loſes its acquired weight, as the air proves more or leſs moiſt. The alteration in this liquor is ſo great, that in the ſpace of fifty-ſeven days it has been known to change its weight from three drachms to nine; and has ſhifted an index or tongue of a balance thirty degrees. A ſingle grain, after its full increaſe, has varied its equilibrium ſo ſenſibly, that the tongue of a balance, only an inch and half long, has deſcribed an arch one-third of an inch in compaſs; which arch would have been almoſt three inches, if the tongue had been one foot, even with ſo ſmall a quantity of liquor; conſequently, if more liquor, expanded under a large ſurface, were uſed, a pair of ſcales might afford no nice an *hygrometer* as any kind yet invented. The ſame author ſuggeſts, that oil of ſulphur per campanum, or oil of tartar per deliquium, or the liquor of fixed nitre, might be ſubſtituted in lieu of the oil of vitriol.

This balance may be contrived two ways; by either having the pin in the middle of the beam, with a ſlender tongue, a foot and half long, pointing to the diviſions on an arched plate, as repreſented in *fig.* 35.

Or, the ſcale with the liquor may be hung to the point of the beam near the pin, and the other extreme be made ſo long, as to deſcribe a large arch on a board placed for the purpoſe, as repreſented in *fig.* 36.

Mr. Arderon has propoſed ſome amendment in the ſponge *hygrometer*. He diveſts the ſponge A (*fig.* 37.) to be ſo cut, as to contain as large a ſuperficies as poſſible, and to hang by a fine thread of ſilk, upon the beam of a balance B, and exactly balanced on the other ſide by another thread of ſilk at D, ſtrung with the ſmalleſt lead-ſhot, at equal diſtances, ſo adjuſted as to cauſe an index, E, to point at G, the middle of a graduated arch, FGH, when the air is in a middle ſtate, between the greateſt moiſture and the greateſt dryneſs. Under this ſilk ſo ſtrung with ſhot, is placed a little table or ſhelf, I, for that part of the ſilk and ſhot, which is not ſuſpended, to reſt upon. When the moiſture imbibed by the ſponge increaſes its weight, it will raiſe the index, and alſo part of the ſhot, from the table, and *vice verſa*, when the air is dry. Phil. Tranſ. N° 479. vol. xlii. p. 96.

From a ſeries of hygroſcopical obſervations, made with an apparatus of deal wood, deſcribed in the Philoſophical Tranſactions, N° 480. Mr. Conters concludes, 1. That the wood ſhrinks moſt in ſummer, and ſwells moſt in winter, but is moſt liable to change at ſpring and fall. 2. That this motion happens chiefly in the day-time, there being ſcarce any variation in the night. 3. That there is a motion even in dry weather, the wood ſwelling in the morning, and ſhrinking in the afternoon. 4. The wood, by night as well as day, uſually ſhrinks when the wind is in the north, north-eaſt, and eaſt, both in winter and ſummer. 5. That by conſtant obſervation of the motion and reſt of the wood, with the help of a thermometer, one may tell the ſituation of the wind without a weather-cock.

He adds, that the time of the year may be known by it; for in ſpring it moves quicker and more than in winter; in ſummer it is more ſhrunk than in ſpring; and has leſs motion in autumn than in ſummer.

See an account of the method of conſtructing theſe and other *hygrometers* in Lowthorp's Abridg. Phil. Tranſ. vol. ii. p. 30, &c. and plate 1. annexed. See alſo Phil. Tranſ. vol. xliii. N° 473. p. 6, &c. vol. xliv. p. 169, and p. 184.

Dr. Hooke's *hygrometer* was made of the beard of a wild oat, ſet in a ſmall box, with a dial-plate and an index. See his Micrographia, p. 150, &c.

An *hygrometer* of this kind may be conſtructed in the following manner. Let ABCD (*fig.* 38.) be a ſquare braſs plate, about four inches ſquare, with a ring or circle fixed to it, graduated on the flat and the inner edge. IC repreſents a very light index of braſs or ſteel, with a ſmall cylindric lump in its centre, into which is faſtened the top of the beard of a wild oat, by a little peg, and the other end of it in another lump, about an inch under the plate, which, having a little hole under C, allows the beard of the oat to come through, in order to carry the hand, and yet keep it in its place, without hindering it to twiſt and untwiſt. There are alſo two wires coming down under the middle of the plate, which hold a little croſs-bar, making a ſmall frame to carry the lump that holds the bottom of the beard expoſed to the air. The four feet of this inſtrument, two of which are ſeen at C, D, muſt be about one inch and a quarter long, to keep the frame under the plate from touching any thing which the inſtrument is ſet upon. AB, in *fig.* 39. repreſents the plate, E and F two of its feet, C and D the little lumps to which the wild oat-beard, CD, is faſtened; *e f* and *g b* the wires ſupporting the piece *f b*, and all together form an open frame, to hold the lump D. The beard paſſes through the hole *e*, in order to carry the index IC, which points to the degrees on the graduated circle AB.

The following *hygrometer* was contrived by doctors Hales and Deſaguliers. P *o p* to C, (*fig.* 40.) is a piece of lignum vitæ, cylindric at C to P, but from C to *o* a truncated cone, and ſcrewed like the ſcrew of a watch, but not ſo taper. The length of the inſtrument is about a foot, the cylindric part an inch in diameter, and half an inch long; the large part of the ſcrew about three quarters of an inch, and the ſmall part half an inch; at each end there are fine ſteel pivots, bearing on two fine conic holes in braſſes in the frame that carries the inſtrument, that it may turn eaſily. A ſponge, S, hangs by a ſilk from the cylinder of the inſtrument, ſo as to turn it by its riſing or falling; a weight W, hanging from another ſilk *a*, coiled upon the ſcrew C *p*, keeps the ſponge in equilibrio. When the ſponge becomes heavier, by imbibing moiſture from the air, it runs down, and draws up W; but as W comes up, its ſtrings muſt advance towards C *o*, where hanging farther from its center, its power will be ſo increaſed, that it will keep the ſponge in equilibrio, though its weight be increaſed. But as the weight riſes, it will ſhew on the ſcale, D D, how much the ſponge is heavier, and conſequently the air moiſter. This inſtrument will be made ſtill more ſenſible, when its pivots are ſupported by four ſteel wheels. Salt of tartar, or any other *ſalt*, or *ſal-ſtbes*, may be put into the ſcale of a balance, and uſed inſtead of the ſponge. Deſag. Exp. Phil. vol. ii. p. 306.

In an *hygrometer* invented and deſcribed by Mr. Ferguſon, A A A A (*fig.* 41.) is a frame of wainſcot or mahogany, grooved in the longeſt ſides, to hold the pannel B B B B of white deal board, without pinching it. The pannel is about the thickneſs of a crown-piece, and fifteen inches long croſs-wiſe to the grain of the wood. The middle part projects at C and C, where it is faſtened into the frame by two ſcrews; ſo that this part always remains in the ſame place, whilſt the reſt of the pannel expands by moiſt air towards both ends of the frame, and contracts towards the middle, when the air is dry. To a pin at E is faſtened one end of a ſmall flexible cord D E, and the other end goes round the pulley G, and is fixed into the bottom of its groove at *b*. One end of another ſmall cord, I K, is fixed into the groove of the large pulley, H, at *a*, going round the part *a* H, and paſſing round to M, round a ſmall pulley L, the axis of which

which turns in the piece O, lying above it, and screwed to the frame at C. To the end of the cord is fuſpended a flattiſh weight N. The diameters of the pullies, G and L, are equal, and about one-tenth of the diameter of H. The diſtance of the pullies, G, and pin F, will determine the expanſion of the pannel between F and G; which will cauſe the pulley, G, to turn backward, and any point in H to move as much; and in this proportion will the weight N be raiſed: therefore if the pannel extend one-tenth of an inch by moiſt air, the pulley L will be turned quite round. As the air grows dry, the pannel contracts, the weight N deſcends, and turns all the pullies the contrary way. The back of the plate A A, (*fig.* 42.) is ſcrewed to the other ſide of the frame, ſo that the ſtrait edge of the plate may be even with the uppermoſt ſide of the frame, and the centre B may be directly over the centre of the pulley I. (*fig.* 41.) on whoſe axis the index B C (*fig.* 42.) is fixed, which, by moving on the graduated edge of the plate, indicates the moiſture or dryneſs of the air. The pannel ſhould be changed in three or four years. Phil. Tranſ. vol. liv. art. 47.

Mr. Smeaton's *hygrometer* is exhibited in *fig.* 43. and *fig.* 43. A B C (*fig* 43.) is an orthographic delineation of the whole inſtrument ſeen in front, with the box-cover H, which defends the index, &c. from injury, and by a glaſs expoſes the ſcale to view. F G in both figures repreſents a flaxen cord, about thirty-five inches long, ſuſpended by the turning peg F, attached to a loop of braſs wire at A. This cord is that which is called by net-makers in London *flaxen three-threads laid*, and is between one-twentieth and one-thirtieth of an inch in diameter. It is previouſly boiled in a ſolution of two penny-weights troy of common ſalt in one pound avoirdupoiſe of water, boiled till the whole is reduced to ſix ounces avoirdupoiſe. The cord ſoaked in this brine is dried, and then ſtretched, by tying three or four yards of it to two nails againſt a wall, in a horizontal poſition, and hanging a weight of a pound or two to the middle. When it has remained in this poſition for a week or more in a room, it will be fit for uſe. G, I, (*fig.* 44.) are two loops, or long links of braſs wire, laying hold of the index K L, which is moveable on a ſmall ſtud or centre, K. The cord F G is kept moderately ſtrained by a weight M, about half a pound avoirdupoiſe. As the cord lengthens or ſhortens, the end of the index paſſes over the ſcale N Q, diſpoſed in the arc of a circle, and containing a hundred equal diviſions. This ſcale is attached to the braſs ſliding ruler Q P, which moves upon the directing piece R R, fixed by ſcrews to the board, which makes the frame or baſe of the whole; and the ſcale and ruler, N Q P, are retained in any place nearer to or farther from the centre K, by the ſcrew S. *Fig.* 45. repreſents in profile the ſliding-piece and ſtud I, which traverſes on that part of the index next the centre K; and which can, by the two ſcrews of the ſtud, be retained upon any part of the index that is made parallel, and which is done for three or four inches from the centre, for that purpoſe. The ſtud is filed to the edges like the fulcrum of a ſcale-beam, one being formed on the under-ſide, and the other upon the upper, as near as poſſible to one another. A book, formed at the lower end of the wire loops, G, I, retains the index by the lowermoſt end of the ſtud, while the weight M hangs by a ſmall hook upon the upper edge. By theſe means the index is kept ſteady, and the cords ſtrained by the weight, with very little friction or burthen upon the central ſtud K. *Fig.* 46. is a parallelogram of plate braſs, to keep out duſt, which is attached to the upper edge of the box-cover H, and ſerves to ſhut the part of the cover, neceſſarily cut away, to give leave for the wire, G I, to traverſe with the ſliding ſtud (*fig.* 45.) nearer to or farther from the centre of the index K. In this (*fig.* 46.) there is a hole *a*, about one-fifth of an inch diameter, for the wire G I to paſs through, in the motion of the index, without touching; *b* is a ſlit of a leſſer ſize, ſufficient for the wire to paſs, and allow the cover to come off without diſarranging the end of index; *c c* are two ſmall ſcrews applied to two ſlits, by which the plate ſlides lengthways, in order to adapt the hole *a* to the wire G I, at any place of the ſtud I, upon the index K L. This index is twelve inches long, four inches of which, from the extreme end, are filed ſo narrow, that any part of them may ſerve for an index to the diviſions of the ſcale; the ſcale itſelf alſo ſlides four inches. The directing piece, R R, is parallel to a line drawn from O upon the ſcale to the centre, K, of the index; conſequently, as the attenuated part of the index forms a part of a right line drawn from the ſame centre, whenever the index points to O upon the ſcale, though the ſcale be removed nearer to or farther from the centre of the index, yet it produces no change in the place to which the index points. When the divided arc of the ſcale is at ten inches from the centre, which is its mean diſtance, then the centre of the arc and the centre of the index are coincident. At other diſtances, the extremes of which are eight or twelve inches, the centre of the diviſions, and the centre of the index, pointing to them, not being coincident, the index cannot move over ſpaces geometrically proportionable to one another in all ſituations of the ſcale; yet the whole ſcale not exceeding thirty degrees of a circle, it will be found, on computation, that the error can never be ſo great as $\frac{1}{100}$th part of the ſcale, or one degree of the *hygrometer*.

For adjuſting the inſtrument, take off the box-cover, and ſet the inſtrument nearly upright about a yard from a moderate fire; there let it remain, till the index ſinks as low as it will go, ſtroking the cord occaſionally between the thumb and finger downwards. When it is become ſtationary, raiſe or depreſs the index by means of the peg at top, till it lies over the point 0; then remove the inſtrument from the fire, and with a camel-hair pencil dipped in warm water, moiſten the cord, without ſuffering any drops of water to fall from it, till it is ſaturated, and the index becomes ſtationary. If the index lies over the degree marked 100, all is right; if not, ſlack the ſcrew S, and ſlide the ſcale nearer to or farther from the centre, till the point 100 comes under the index, and the inſtrument is adjuſted for uſe. If the compaſs of the ſlide be not ſufficient to effect this, ſlack the proper ſcrews, and move the ſliding ſtud I nearer to or farther from the centre of the index, as the angle, formed by the index between the points of dry and wet, happens to be too ſmall or too large for the ſcale. Mr. Smeaton was led by obſervation to mark the point of 0 *dry*, 20° the *mean*, 40° *moiſt*, 70° *very moiſt*, and 100° *wet*. Phil. Tranſ. vol. lxi. part i. art. 24.

The laſt *hygrometer* we ſhall deſcribe is that of M. de Luc. The part of this *hygrometer* which is affected by the moiſture of the air, is a hollow tube of ivory *a a b*, (*fig.* 47.) two inches eight lines long, and internally two lines and a half in diameter. This tube is open at the end *a a*, and cloſed at *b*, terminating in a point; and the thickneſs of its ſides, for the length of two inches ſix lines from the bottom, is but three-ſixteenths of a line: it is this thin part which does the office of an *hygrometer*; the remaining part of the cylinder, towards its orifice *a a*, muſt be kept a little thicker, in order to bear the preſſure of a tube of glaſs, about fourteen inches long, the lower end of which is ſeen *d d e e*. The internal diameter of this tube is about three-eighths of a line, and the outſide diameter about two lines, in order that the part *f f* of a braſs piece *f f g g*, through which it paſſes, and which is to enter into the ivory pipe, be as thin as poſſible. In order to hinder that part of the tube, which incloſes the braſs piece, from being affected by the variations of moiſture, it is covered with a braſs ferrol *h h i i*. Theſe pieces are united together with gum lac or maſtich, which melts by the heating of the glaſs and braſs. M. de Luc's reaſon for chuſing ivory for his *hygrometer*, is, that this matter appeared to him more proper than any other for receiving the impreſſion of the moiſture of the air, without ſuffering thereby any material change. The cylinder made of it becomes more capacious, in proportion as it grows moiſter; and this is the fundamental principle of the inſtrument. M. de Luc has alſo found, that upon letting this cylinder lie for ſome time in water of an uniform temperature, it ſwells to a certain point, after which it dilates no farther. This circumſtance furniſhed him with a *maximum* of humidity; and, conſequently, with one point of compariſon in the ſcale of the *hygrometer*; and this point he has fixed at the temperature of melting ice. For meaſuring the differences in the capacity of this ivory cylinder, and thereby diſcovering its different degrees of moiſture, M. de Luc makes uſe of quickſilver, with which he fills the cylinder, and a part of the communicating glaſs tube. The more capacious this cylinder is, or, which is the ſame, the moiſter it is, the lower does the mercury ſtand in the glaſs tube, and *vice verſâ*. Now M. de Luc has found, that the loweſt point to which it can ſink, is that where it ſtands when the ivory cylinder is ſoaked in melting ice: he, therefore, names or graduates this point 0 in the ſcale of his *hygrometer*; and, conſequently, the degrees of this ſcale are degrees of dryneſs, counted from below upwards, as the quickſilver riſes in the glaſs tube. To give theſe degrees a determinate length, and thus to render the *hygrometer* capable of being compared with each other, M. de Luc employs in conſtructing them ſuch glaſs tubes as have been previouſly prepared, by being made into thermometers, and filled with mercury, ſo as to aſcertain upon them the points of melting ice and boiling water, and to take exactly the diſtance between theſe points by any ſcale at pleaſure. When this is done, the bulb of this preparatory thermometer muſt be broken, and the quickſilver

silver it contains exactly weighed. It is by knowing the weight of this, together with the distance between the fixed points of the thermometer, that the scale of the *hygrometer* is determined. E. gr. Let the weight of the quicksilver be one ounce, and the distance between the above mentioned points one thousand parts of a certain scale; then suppose that the quicksilver in the *hygrometer*, to which this tube is to be applied, weighs only half an ounce; this will give a fundamental line, consisting of five hundred parts of the same scale. The fundamental line, thus found, is applied to the scale of the *hygrometer*, beginning at 0, and measuring it off about four times over, that the whole variation of the instrument may be comprehended. Each of those spaces being afterwards divided into forty equal parts, given such degrees as M. de Luc has found most convenient. In general terms, the length of the fundamental line of the *hygrometer* must be to the interval between the two fixed points of the preparatory thermometer, as the weight of the quicksilver in the *hygrometer* is to the weight of the quicksilver in that thermometer. This proportion between the scale of the *hygrometer*, and that of the preparatory thermometer, furnishes an easy method of correcting in this instrument the effects of heat upon the mercury which it contains. It will easily be conceived, from the construction of the scale of this *hygrometer*, that if its cylinder of ivory was suddenly changed into glass, the instrument would become a true thermometer, in which the interval between the points, answering to melting ice and boiling water, would be divided into forty parts. If, therefore, a thermometer, with a scale similarly divided into forty parts between the fixed points, be placed near the *hygrometer*, it will shew immediately the correction to be made on this instrument for its variation as a thermometer, under particular restrictions, which M. de Luc has stated.

That part of the frame of the instrument on which the scale is marked, is moveable; so that, before observing the points at which the mercury stands, it may be pulled upwards or downwards, according as the thermometer has risen or fallen with respect to the point of melting ice; and thus the indications of the *hygrometer* can at once be freed from the errors which would arise from the difference in the volume of the quicksilver, on account of the different degrees of heat.

For this purpose, at the top of this scale, there is an index over-against another small scale, marked upon the immoveable part of the frame: the degrees of this small scale are eighteenth parts of the fundamental line, and answering to the degrees of the thermometer on the same frame. When the index points to 0 of the small scale, the thread which indicates upon the tube of the *hygrometer* the point to which the mercury sank in the melting ice, answers like wise to 0 in the scale of the *hygrometer*. See an elaborate account of the principles and advantages of this *hygrometer*, the particular process of its construction, and observations made with it by M. de Luc, in the Phil. Trans. vol. lxiii. part ii. art. 38.

The instrument, with its frame, is seen in *fig.* 48. It is mounted on deal, because this wood suffers the least change in the length of its fibres. The lower part of the frame is fit through the whole length of the ivory pipe, in order that the air may circulate freely round this pipe, and the bulb of an annexed thermometer. The *hygrometer* is fastened in three parts, viz. at bottom on a small bracket, at top by a tube passing through a piece either of hard wood or of metal fastened by screws, but chiefly by means of a brass wire on the neck of the brass piece, which unites the glass with the ivory pipe. This piece is laid in a small plate of a hard wood, which in that place fills a groove originally made through the whole length of the board. To prevent dust from getting through the opening of the tube, it is shut up in a small ivory case. The scale of the *hygrometer* is marked upon a deal slip, which slides along the groove just mentioned. This and all the other parts of the frame must be lined with paper, for marking the necessary scales, and this paper is afterwards varnished over. The scale of the *hygrometer* is carried to the proper point, by means of a knob fixed on a small piece of hard wood or metal, screwed to the bottom of the board, and which affords a free passage to the tube of the *hygrometer*.

HYGROPHOBIA, in *Medicine*, is sometimes used in the same sense with HYDROPHOBIA.

HYGROSCOPE, compounded of *ὑγρὸς*, *moist*, and *σκοπέω*, *I observe*, or *consider*, is commonly used in the same sense with HYGROMETER.

Wolfius, however, regarding the etymology of the word, makes some difference. According to him, the *hygroscope* only shews the alterations of the air in respect of humidity and drines; but the hygrometer measures them. A *hygroscope*, therefore, is a less accurate hygrometer.

HYIOTES, *Τιοτης*, *Filiation*. See ADOPTION.

HYKES, a sort of blankets, in great use among the natives of Barbary. They are woven by the women, who make no use of a shuttle therein, but conduct every thread of the woof with their fingers. One of these *hykes* is usually six yards long, and five or six broad, serving the Kabyle as well as Arab, both male and female, for a complete dress in the day, and for his bed and covering in the night. It is a loose and troublesome kind of garment, being frequently disconcerted, and falling on the ground; so that the wearer is every moment to be tucking it up, and folding it anew round his body. Dr. Shaw (Trav. p. 286.) takes it to be much the same with the peplus, if not with the toga, of the ancients.

HYLARCHIUS, formed of *ὑλη*, *matter*, and *ἀρχη*, *government*, or *principle of motion*, a word by which some authors express what they call a ruling and presiding spirit, which governs and actuates all matter. See PLASTIC.

HYLE, or HYLES, from *ὑλη*, which signifies *matter*, among *Alchemists*, is their first matter, or it is matter considered as produced by nature herself; called also chaos.

HYLEG, or HYLECH, in *Astrology*, an Arabic term for a planet, or for a point of the heavens, which in a man's nativity becomes, as is pretended, the moderator and significator of life.

HYLEGIAL, *Ὑλεγιακὸς*, among *Astrologers*, are those wherein a planet being found, is qualified to have the government of life attributed to it.

HYLOBII, or HYLOBIANS, compounded of *ὑλη*, which besides *matter*, signifies also *wood*, *forest*, and *low life*, a sect of Indian philosophers, thus denominated by the Greeks because they retired to forests, to be more at leisure for the contemplation of nature.

HYLOPATHIANS, formed of *ὑλη*, *matter*, and *παθος*, of *πασχω*, *I suffer*. See the following article, and ANAXIMANDRIANS.

HYLOZOISTS, formed of *ὑλη*, *matter*, and *ζωη*, *life*, the name of a sect of atheists among the ancient Greek philosophers, who held matter to be animated; maintaining that matter had some natural perception without animal sensation, or reflection in itself considered; but that this imperfect life occasioned that organization, whence sensation and reflection afterwards arose. Of these, some held only one life, which they called a PLASTIC nature, presiding regularly and invariably over the whole corporeal universe, which they represented as a kind of large plant or vegetable: these were called the cosmoplastic and hylozoic atheists, because the Stoics held such a nature, though many of them supposed it to be the instrument of the Deity. Others thought that every particle of matter was endued with life, and made the mundane system to depend upon a certain mixture of chance and plastic or orderly nature united together. These were called the Stratonic, from Strato Lampsacenus, a disciple of Theophrastus, called also Physicus. (Cicero, De Nat. Deor. lib. i. cap. 13.) who was first a celebrated Peripatetic, and afterwards formed this new system of atheism for himself. Besides these two forms of atheism, some of the ancient philosophers were Hylopathians, or ANAXIMANDRIANS, deriving all things from dead and stupid matter, in the way of qualities and forms, generable and corruptible; and others again adopted the ATOMICAL or Democritical system, who ascribe the production of the universe to atoms and figures. See on this subject Cudworth's Intellectual System, vol. i. book i. chap. 3. Birch's edit. 1743.

HYMEN, *Τμην*, in *Anatomy*, a thin membrane or film, sometimes circular of different breadths, more or less smooth and sometimes semilunar, formed by the union of the internal membrane of the great canal with that on the inside of the ala, resembling a piece of fine parchment. This membrane is supposed to be seen best in the neck of the womb of virgins, below the nymphæ, leaving in some subjects a very small opening, in others a larger, and in all rendering the external orifice narrower than the rest of the cavity, and to be broke when they are deflowered; an effusion of blood following the breach.

This membranous circle may likewise suffer some disorder by too great a flux of the menses, by suppuration, acrity, and other particular accidents.

The *hymen* is generally looked upon as the test of virginity; and when broke, or withdrawn, shews that the person is not in a state of innocence. This notion is very ancient. Among the Hebrews, it was the custom, for the parents to save the bloud shed on this occasion, as a token of the virginity of their daughter, and to send the sheets next day to the husband's relations. And the like is said to be still practised in Portugal, and some other countries.

And yet authors are not agreed as to the existence of such a membrane. Nothing, Dr. Drake observes, has em-

ployed the curiosity of anatomists, in dissecting the organs of generation in women, more than this part: they have different not only as to its figure, substance, place, and perforation, but even its reality; some positively affirming, and others flatly denying it.

De Graaf himself, the most accurate inquirer into the structure of these organs, confesses, he always sought it in vain, though in the most unsuspected subjects and ages: all he could find was, a different degree of straitness or wideness, and different corrugations, which were greater or less, according to the respective ages; the aperture being still the less, and the rugosities the greater, as the subject was younger, and more untouched.

Dr. Drake, on the other hand, declares, that in all the subjects he had opportunity to examine, he does not remember to have missed the *hymen* so much as once, where he had reason to depend on finding it. The fairest view he ever had of it was, in a maid who died at thirty years of age: in this he found it a membrane of some strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman's little finger, and situate a little above the orifice of the urinary passage, at the entrance of the vagina of the womb.

In infants, it is a fine thin membrane, not very conspicuous, because of the natural straitness of the passage itself, which does not admit of any great expansion in so little room; which might lead De Graaf into a notion of its being no more than a corrugation.

This membrane, like most others, does, probably, grow more distinct, as well as firm, by age. That it not only exists, but is sometimes very strong and impervious, may be collected, from the history of a case reported by Mr. Cowper. In a married woman, twenty years of age, whose *hymen* was found altogether impervious, so as to detain the menses, and to be driven out, by the pressure thereof, beyond the labia of the pudendum, not unlike a prolapsus of the uterus: on dividing it, at least a gallon of grumous blood came forth. It seems the husband, being denied a passage that way, had found another through the meatus urinarius; which was found very open, and its sides extruded like the anus of a cock.

Upon a rupture of the *hymen*, after the consummation of marriage, and especially delivery, its parts, shrinking up, are supposed to form those little fleshy knots, called CARUNCULÆ *myrtiformes*.

HYMEN, in *Botany*, is used for a fine, delicate skin, wherewith flowers are enclosed while in the bud, and which bursts as the flower blows or opens.

The term *hymen*, in this sense, is particularly used in speaking of roses.

HYMEN, in *Mythology* and *Poetry*, a term of invocation. *Hymen, or Hymenæus*, is properly a fabulous divinity, supposed by the ancients to preside over marriages; and who accordingly was invoked in epithalamiums, and other matrimonial ceremonies, under the formula, *Hymen o Hymenæe!*

The poets generally crown this deity with a chaplet sometimes of roses, at other times of sweet marjoram; and represent him, as it were, dissolved and enervated with pleasures; dressed in a yellow robe, and those of the same colour, with a torch in his right-hand, and a flame-coloured veil in his left. Catullus, in one of his epigrams, addresses him thus:

Cinge tempora floribus,
Suavolentis amaraci.

It was for this reason, that the new married couple bore garlands or flowers on the wedding-day; which custom also obtained among the Hebrews, and even among the Christians, during the first ages of the church, as appears from Tertullian, De Corona Militari, where he says, *Coronant & nuptæ sponsos.* St. Chrysostom likewise mentions these crowns of flowers; and to this day the Greeks call marriages στεφανωσις, in respect of this crown or garland.

HYMENÆA, in *Botany*. See LOCUST-*tree*.

HYMENODES, of ὑμην, *membrane*, and εἰδος, *form*, an epithet applied by the old authors to such urine as is found to be full of little films and pellicles. Hippocrates also applies it to the menstrual discharges, when they are mixed with a tough viscid phlegm.

HYMENOPTERA, derived from ὑμην, *membrane*, and πτερον, *wing*, in the Linnæan system of *Natural History*, is an order of insects, having four membranaceous wings, and the tails of the females are furnished with stings, which in some are used for instilling poison, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs. To this class belong ten genera, viz. *cynips, tenthredo, sirex, ichneumon, sphex, vespa, apis* or *bee, formica* or *ant*, and *mutilla*, comprehending a great number of subordinate species.

HYMETTIUM *marmor*. See MARBLE.

HYMN, a *song*, or *ode*, in honour of God; or a poem proper to be sung, composed in honour of some deity. See ODE, and SONG.

The word is Greek, ὑμνος, *hymnos*, formed of the verb ὑμεω, *celebro, I celebrate*.

Isidore, on this word, remarks, that *hymn* is properly a song of joy, full of the praises of God; by which, according to him, it is distinguished from *threnus*, which is a mourning song, full of lamentation.

The *hymns*, or odes, of the ancients, generally consisted of three stanzas or couplets: the first called *strophe*; the second, *antistrophe*; and the last, *epode*.

St. Hilary, bishop of Poitiers, is said to have been the first that composed *hymns* to be sung in churches: he was followed by St. Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs De Port Royal. The Te Deum is also commonly called a *hymn*, though it be not in verse; so also is the *Gloria in excelsis*.

In the Greek Liturgy there are four kinds of *hymns*; but then the word is not taken in the sense of a praise offered in verse, but simply of laud, or praise. The angelic *hymn*, or GLORIA *in excelsis*, makes the first kind; the TRISAGION, the second; the cherubic *hymn*, the third; and the *hymn* of victory and triumph, called ἐπινικιος, the last.

HYMNIA, in *Mythology*, a surname given to Diana, under which appellation she was worshipped, and had a temple in Arcadia.

HYO-EPIGLOTTICI, in *Anatomy*, are muscular fibres, which go from the convex side of the basis of the os hyoides to the convex side of the epiglottis.

HYOGLOSSUS, in *Anatomy*, a muscle of the tongue, which some divide into three, calling them BASIO-*glossum*, CERATO-*glossum*, and CHONDRO-*glossum*. When they act together, they serve to shorten the tongue; and likewise to turn the point of the tongue between the teeth and the upper lip, and make it pass over that lip. The superior fleshy plane of the body of the tongue bends it upward toward the palate, and makes it pass along or lick the upper lip.

HYOIDES, Τοειδες, in *Anatomy*. The *os hyoides*, called also *bicorne*, is a bone situate in the middle space between the angles of the lower jaw, or at the root of the tongue, making, as it were, the basis or foundation thereof.

It is thus called from its imperfect resemblance of the Greek upsilon Υ; the word being formed of υ and ειδος, *form*; for which reason it is called *ypsiloides*, and *hyppsioides*.

It is distinguished into the *basis*, which is the anterior part, and is the broadest and thickest; two large *cornua*, or *horns*, which are the lateral parts, and two small *cornua* or appendices, which are the superior parts, to the upper end of which other appendices are frequently joined; whence also the appellation *bicorne* and *cerutoides*.

The basis of the *hyoides* is situated transversely, and is about a thumb's breadth long on the outer side, which is unequally convex; the inner being unequally concave. It is half a finger broad, and has a small protuberance in the middle. The cornua are an inch and half long, and broader at bottom than at the extremes, which are about two inches asunder.

It has two cartilaginous processes, which ossify in adults, called *cornicula*, fastened about the juncture of its cornua with the basis: they are tyed to the processus styloides by long slender ligaments; though sometimes between them and the styloides there is found a small muscle, beside the stylocerathoideus.

The basis of this bone lies, as it were, on the head of the larynx; and its horns are fastened by ligaments to the upper processes of the cartilage scutiformis, and styloides.

It is moved by five pair of muscles; viz. the sternohyoideum, the coracohyoideum, the mylohyoideum, the geniohyoideum, and stylohyoideum.

The chief use of this bone is to be the basis and support of the tongue. The pliableness of the small *cornua* is said likewise to contribute to the perfection of singing.

HYO-PHARYNGÆI, in *Anatomy*, are three pair of muscles, inserted in the basis, and in the small and great cornua of the os hyoides.

HYOSCIAMUS, in *Botany*. See HENBANE.

HYOSCIAMUS *Peruvianus, henbane of Peru*, a name by which Dodonæus and many other authors have called the tobacco-plants, more usually known by the name NICOTIANA.

HYOSERIS, in *Botany*, a genus of the *frugenesia polygamia æqualis* class, with a naked receptacle, sub-equal calyx, and hence differentible capillary down.

HYOSYRIS, in *Botany*, a name given by Pliny and some other authors to the common knapweed, or *iacea nigra*.

HYO-

HYOTHYROIDÆI, compounded of *hyoides*, and *thyroides*; in *Anatomy*, a pair of muſcles of the larynx; which, ariſing from the anterior part of the os hyoides, are inſerted into the cartilago thyroides. They ſerve as antagoniſts to the ſternothyroides, and lift up the thyroid cartilage.

HYPACTIC *medicines*, formed of ὑπάγω, *I take away*, a term uſed by ſome authors for cathartic medicines.

HYPÆTHROS, or HYPÆTHRION, Υπαιθριον, formed of ὑπο, *under*, and αἠρ, *air*, in the *Ancient Architecture*, a kind of temple, open at the top, and thereby expoſed to the air.

The *hypæthron*, according to Vitruvius, is an open building or portico, ſuch as anciently were certain temples that had no roof or covering. Of this we have an inſtance, in the temple of Jupiter Olympius, built by Coſſutius, a Roman architect at Athens.

Of *hypæthrum*, ſome were decaſtyle, others pycnoſtyle; but they had all rows of columns within-ſide, forming a kind of PERISTYLE; which was eſſential to this ſort of temple.

HYPALLAGE, *immutation*, a grammatical figure, whereby, of different expreſſions which give the ſame idea, we make choice of that which is leaſt natural and obvious; or, when there is a mutual permutation or change of caſes, moods, regimens, &c.

The term is formed of ὑπαλλαττω, *I change*, compoſed of ὑπο and αλλαττω, *I change*; of αλλος, *another*.

As in this inſtance, *Dare claſſibus auſtros* inſtead of *Dare claſſes auſtris*.

HYPAPANTE, or HYPANTE, a name which the Greeks give to the feaſt of the PURIFICATION of the holy Virgin: or the preſentation of Jeſus in the temple.

The words are Greek, ὑπαντη, and ὑπαντησις, which properly ſignify *humble*, and *lowly meeting*; being compounded of ὑπο, *under*, *beneath*, and αντομαι, or αντασμαι, *I meet*, of αντι, *contra*, *againſt*. The denominations are taken from the meeting of old Simeon, and Anna the prophetreſs, in the temple, at the time the child Chriſt Jeſus was brought thither.

HYPATE, in the *Ancient Muſic*, an appellation given to the loweſt chord or ſound of a tetrachord.

The word is Greek, ὑπατη, which ſome Latin interpreters tranſlate by *ſuprema*; as they tranſlate νετη, by *ultima* or *nona*.

Dr. Wallis ſays, that the firſt contrivers of theſe names took, contrary to our cuſtom, the grave for the higheſt place, and the acute for the loweſt of their ſchemes.

This was the practice of Boethius; and Nichomachus, in the heptachord lyre, aſcribes the *hypate* to Saturn, and the *meſe*, or *nete*, to the Moon. Some however interpret ὑπατη, as if it were ὑπατατη, but erroneouſly, according to the learned doctor juſt quoted, who obſerves, that Homer calls Jove Υπατον κρειοντων, as if ὑπατος were derived from ὑπερατατ. Afterwards it is ſaid, the grave was taken for the loweſt, and the acute for the higheſt place, agreeably to our notions. Some think that the *hypate* might obtain its name from being placed higheſt in the lyre. Marcianus Capella and Boethius, tranſlate *hypate*, *principalis*; and *paripate*, *ſubprincipalis*. Alſo Ariſtides Quintilianus chooſes to call the *hypate* firſt, rather than ſupreme or higheſt, and calls the *nete* laſt, inſtead of loweſt. Perhaps the truth of the matter is, that the *hypate* was called higheſt or loweſt, according as muſicians conſidered the deſcending or the aſcending ſcale. The moveable chord next the *hypate*, was called *paripate*; and that next the *nete* was called *paranete*. See TETRACHORD and INTERVAL.

HYPATE *hypaton*, in the *Ancient Greek Scale*, was the note next to the proſlambanomenos, and anſwers to the loweſt *mi* of Guido's ſcale. See DIAGRAM and INTERVAL.

HYPATE *meſon*, in the *Greek Scale of Muſic*, was the firſt note of the meſon, and the laſt of the hypaton tetrachord. It anſwers to *alamire* of the Guidonian ſcale. See DIAGRAM and INTERVAL.

HYPECOUM, in *Botany*, a genus of the *tetrandria dygynia* claſs. Its characters are theſe: the flower has four petals, and a two-leaved empalement: and has four ſtamina ſituated between the petals; in the centre is placed an oblong cylindrical germen, which becomes a long, compreſſed, jointed pod, which is incurved, with one roundiſh compreſſed ſeed in each joint. There are three ſpecies.

The juice of this plant is of a yellow colour, reſembling that of celandine; and is affirmed by ſome eminent phyſicians to have the ſame effect as opium. Miller.

HYPENEMIUS, an epithet applied by authors to barren eggs, or ſuch as a hen lays before ſhe has been trod by the cock. They are alſo called *zephyria ova*, and had both theſe names from the winds being ſuppoſed to generate them.

HYPER, a Greek word uſed in the compoſition of divers terms derived from that language.

The Greek preposition ὑπερ, *hyper*, literally ſignifies *above*, *beyond*; and in compoſition, it expreſſes ſome exceſs, or ſomething beyond the ſignification of the ſimple word it is joined with. Hence,

HYBERBATON, or HYPERBASIS, in *Grammar* and *Rhetoric*, is a TRANSPOSITION, or a figurative conſtruction, inverting the natural and proper order of the terms of a diſcourſe.

The word is Υπερβατον, or Υπερβασις, derived of ὑπερβαινω, *tranſgredior*, *I go beyond*; formed of ὑπερ, *ultra*, *beyond*, and βαινω, *eo*, *I go*.

The *hyperbaton*, Longinus obſerves, is no other than a tranſpoſal of ſentiments, or words, out of the natural order and method of diſcourſe, and always implies great violence, or ſtrength of paſſion, which naturally hurries a man out of himſelf, and diſtracts him variouſly. Thucydides is very liberal in *hyperbatons*.

Quintilian calls the *hyperbaton*, *verbi tranſverſio*. It is of uſe to enliven and animate the diſcourſe: it is very proper to expreſs a violent paſſion, and repreſent an agitation of mind in the livelieſt manner.

HYPERBIBASMUS, Υπερβιβασμος, in *Rhetoric*, a figure which inverts the order of conſtruction. Cornelius Nepos gives an inſtance of it in his Life of Chabrias: *Athenienſes diem certum Chabrias præſtituerat, quam ante domum reſciſſet, &c. for ante quam.*

HYPERBOLA, in *Geometry*, one of the curve lines, formed by the ſection of a cone. See CONIC *ſection*.

The *hyperbola* ariſes when the plane that cuts the cone is not parallel to one of its ſides, as it is in the *parabola*; but diverges from it outwards, not inward, as in the *ellipſis*.

Thus: if the cone ABC (ſee *Tab. Conics*, *fig.* 27.) be ſo cut, as that the axis of the ſection DQ, continued, concur with the ſide of the cone AC, continued to E; the curve ariſing from this ſection is an *hyperbola*.

Some authors define the *hyperbola* to be, a ſection of the cone by a plane parallel to its axis; but this definition is faulty: for though it be true, that ſuch a ſection really deſcribes an *hyperbola*; yet it is likewiſe true, that a thouſand others may be deſcribed where the plane is not parallel to the axis, and which of conſequence are not included in the definition.

Authors ſometimes call the plane terminated by this curve, an *hyperbola*; and in reſpect thereof, call the curve itſelf, the *hyperbolic line*.

An hyperbola may be defined, with reſpect to its properties, to be a curve line, wherein the ſquare of the ſemi-ordinate is to the rectangle of the abſciſs into a right line compoſed of the ſame abſciſs and a given right line called the *tranſverſe axis*, as another given right line, called the *parameter* of the axis, is to the tranſverſe axis: or it is a curve line, calling the ordinate *y*, abſciſs *x*, and parameter *b*, wherein $ay^2 = bx + \frac{b}{a}xx$, that is, *b*: *a*:: y^2: $ax + x^2$.

In the *hyperbola*, a mean proportional between the tranſverſe axis and parameter, is called the *conjugate axis*: and if the tranſverſe axis AB (*Tab. Conics*, *fig.* 27. n. 2.) be joined directly to the axis AX, and be biſected in C; the point C is called the *centre* of the *hyperbola*.

If a right line DE paſs through the vertex A, *fig.* 20, parallel to the ordinate *Mm*, it is a tangent to the *hyperbola* in A.

If a right line DE be drawn through the vertex A of an *hyperbola* parallel to the ordinate *Mm*, and be equal to the conjugate axis, viz. the parts DA and AE equal to the ſemi-axis; and right lines CE and CG be drawn from the centre C through D and E; thoſe lines are called *aſymptotes* of the *hyperbola*.

The ſquare of the right line CI, or AI, is called the *power* of the *hyperbola*.

Properties of the HYPERBOLA. 1. In the *hyperbola*, the ſquares of the ſemiordinates are to each other, as rectangles of the abſciſs into a certain right line compoſed of the abſciſs and tranſverſe axis. Hence, as the abſciſſes *x* increaſe, the rectangles $ax + x^2$, and conſequently the ſquares of the ſemi-ordinates y^2; and therefore the ſemiordinates themſelves increaſe. The *hyperbola*, therefore, continually recedes from its axis.

2°. The ſquare of the conjugate axis is to the ſquare of the tranſverſe, as the parameter to the tranſverſe axis. And hence, ſince *b*: *a*:: PM²: AP×PB, the ſquare of the conjugate axis, is to the ſquare of the tranſverſe, as the ſquare of the ſemiordinate is to the rectangle of the abſciſs into a line compoſed of the abſciſs and tranſverſe axis.

3°. *To deſcribe an* hyperbola, by continued motion; the tranſverſe axis, and the diſtance from the vertex, being given. In the two foci F and Z, *fig.* 28. fix two nails or pins; and to one of them, in F, tie a thread, FMC, faſtening the other end C to the ruler CZ, which exceeds the ſame by the tranſverſe axis AB. The other end of the

ruler

rules being perforated, put it on the pin Z; and fixing a ſtyle to the thread, move the ruler. Thus will the ſtyle trace out an *hyperbola*. Again, with the ſame data, any number of points in an *hyperbola* are eaſily found, which may be connected into an *hyperbola*. Thus, from the focus Z, with any interval Zm greater than AB, deſcribe an arch; and making $Ab = AB$; with the remaining interval bm, from the point F, draw another arch interſecting the former in m: therefore $Zm - Fm = AB$; m is a point in the *hyperbola*. And ſo of the reſt.

4°. If in an *hyperbola*, the ſemidrdinate PM, *fig.* 20. be produced till it meet the aſymptote in R; the difference of the ſquares of PM and PR is equal to the ſquare of the conjugate ſemi-axis DA or Cd. Hence as the ſemiordinate PM increaſes, the right line MR decreaſes, and therefore the *hyperbola* itſelf approaches nearer to the aſymptotes; but it can never abſolutely meet it, becauſe $zx\ PR^2 - PM^2 = DA^2$; it is impoſſible $PR^2 - PM^2$ ſhould ever become $= 0$.

5°. In an *hyperbola*, the rectangle of MR and Mr is equal to the difference of the ſquares PR^2 and PM^2. And hence the ſame rectangle is equal to the ſquare of the conjugate ſemi-axis DA; and conſequently all rectangles formed in the ſame manner are equal.

6°. If $y\,m$ be parallel to the aſymptote CF, the rectangle of $y\,m$ into Cy is equal to the power of the *hyperbola*. And hence, 1°. If we make $CI = AI = a$. $C\,\varphi = x$, and $\varphi\,m = y$, we ſhall have $a^2 = xy$; which is the equation expreſſing the nature of the *hyperbola* between its aſymptotes. 2°. The aſymptotes, therefore, being given in poſition, and the ſide of the power of CI or AI; if in one of the aſymptotes CG, you take any number of abſciſſes; ſo many ſemiordinates will be found, and by them any number of points in an *hyperbola* will be determined by finding third proportionals to the abſciſs, and the ſide of the power CI. 3°. If the abſciſſes be not computed from the centre C, but from ſome other point L; and CL be ſuppoſed $= b$; we ſhall have $Cy = b + x$; and conſequently $a^2 = by + xy$.

7°. In the *hyperbola*, as the tranſverſe axis is to the parameter, ſo is the aggregate of the tranſverſe ſemi-axis and abſciſs, to the SUBNORMAL: and as the aggregate of the tranſverſe ſemi-axis and abſciſs is to the abſciſs; ſo is the aggregate of the entire tranſverſe axis and abſciſs to the SUBTANGENT.

8°. If within the aſymptotes of an *hyperbola*, from a point thereof, m, *fig.* 29, be drawn two right lines Hm and mK, and other two LN and NO, parallel to the ſame; $H \times m\,K = HL\,N \times NO$. And the ſame will hold, if you draw $L\,N\,o$ parallel to the right line thus drawn $H\,o\,K$; viz. in this caſe, likewiſe, $H\,m \times m\,K = LN \times N\,o$. Conſequently, all rectangles formed after this manner of right lines drawn parallel either to the ſame line HK, or to two, $H\,m$ and $m\,K$, are equal to each other.

9°. If a right line HK be drawn in any manner between the aſymptotes of an *hyperbola*; the ſegments HE and $m\,K$ intercepted on each ſide between the *hyperbola* and aſymptotes are equal. And hence, if $Em = a$; the right line HK is a tangent to the *hyperbola*: conſequently the tangent FD intercepted between the aſymptotes, is biſected in the point of contact V. Laſtly, the rectangle of the ſegments $H\,m$ and $m\,K$, parallel to the tangent FD, is equal to the ſquare of half the tangent DV.

10°. If from the centre C, *fig.* 30, you draw a right line CA, and through the point A a tangent E A D terminated by the aſymptotes, CA is a ſemi-tranſverſe diameter, and E A D is equal to its conjugate diameter: and the ſquare of the ſemiordinate in the *hyperbola* PM drawn parallel to the conjugate diameter is to the rectangle of the abſciſs, and aggregate of the tranſverſe diameter AB, and abſciſs AP, as the ſquare of the conjugate ſemidiameter AD, is to the ſquare of the tranſverſe ſemidiameter CA. Hence if you ſuppoſe $AP = x$, $PM = y$, $AB = a$, $DA = c$, we ſhall have $y^2 = \frac{(c^2 a + c^2 x^2)}{1\ a^2} = \frac{4c^2 a}{a} + \frac{4c^2 x^2}{a^2}$ and making $\frac{4c^2}{a} = b$, we ſhall have $y^2 = bx + \frac{bx^2}{a}$. So that the ſame equation defines the nature of the *hyperbola*, in reſpect of its diameter, as expreſſes it in reſpect of its axis; and the parameter is a third proportional to the conjugate diameters D E and A B.

11°. If from the vertex A, and any point of the *hyperbola* N, you draw AF and T N parallel to the aſymptote C R; the rectangle of TN into TC will be equal to the rectangle of FA into FC. Hence, if $TC = x$, $TN = y$, $FC = a$, and $FA = b$; the equation expreſſing the nature of an *hyperbola* within its aſymptotes, in reſpect of its diameter, will be $xy = ab$.

12°. An aſymptote being taken for a diameter; divided into equal parts, and through all the diviſions, which form ſo many abſciſſes continually increaſing equally, ordinates to the curve being drawn parallel to the other aſymptote; the abſciſſes will repreſent an infinite ſeries of natural numbers; and the correſponding *hyperbolic* or aſymptotic ſpaces, will repreſent the ſeries of LOGARITHMS of the ſame numbers. Hence different *hyperbolas* will furniſh different ſeries of logarithms to the ſame ſeries of natural numbers; ſo that to determine any particular ſeries of logarithms, choice muſt be made of ſome particular *hyperbola*. See COMIC *Seſtion* and *Logarithmic* CURVE. Now, the moſt ſimple of all the *hyperbolas* is the equilateral one, i. e. that whoſe aſymptotes make a right angle between them. This, M. De Lagni alledges in favour of the BINARY *arithmetic*, as being the reſult of ſuch equilateral *hyperbola*.

Ambigenal HYPERBOLA is that which has one of its infinite legs inſcribed, and the other circumſcribed.

Equilateral HYPERBOLA is that wherein the conjugate axes A B, *fig.* 30, and D E, are equal.

Properties of the equilateral HYPERBOLA. Since the parameter is a third proportional to the conjugate axes, it is alſo equal to the axis: wherefore, if in the equation $y^2 = bx + \frac{bx^2}{a}$ you ſuppoſe $b = a$; the equation $y^2 = ax + x^2$ will expreſs the nature of the equilateral *hyperbola*.

And hence the ſquares of the ordinates y^2 and z^2 are to each other as $ax + x^2$ and $az + z^2$: that is, as the rectangles of the abſciſſes into right lines compoſed of the abſciſs and ordinate.

If you ſuppoſe $PC = x$, $CA = r$, then will $AP = x - r$, and $PB = x + r$. Conſequently $y^2 = x^2 - r^2$.

And ſince AE = CA: the angle ACE will be half right; and conſequently the angle of the aſymptotes FCG a right angle.

Infinite HYPERBOLAS, or HYPERBOLAS *of the higher kinds*, are thoſe defined by the equation $a^n y^0 + {}^1 = b^n (\frac{1}{a}x)^n$. Hence in the infinite *hyperbolas* $a^n y^0 + {}^1 = a^{0n} + {}^{1n} \times b^n (a + x)^0 : {}^1$: that is $y^0 + {}^1 : {}^{0n} + {}^{1n} :: a^n (a + x)^n : x^n (a + x)^n$. See HYPERBOLOID.

As the *hyperbola* of the firſt kind, or order, has two aſymptotes; that of the ſecond kind, or order, has three; that of the third, four, &c.

In reſpect of theſe, the *hyperbola* of the firſt kind is called the *Apollonian* or *conical hyperbola*: it is thus called in contradiſtinction to the *hyperbolas* of the higher kinds. It is called *hyperbola* from ὑπερβάλλω, *to exceed*, becauſe in this curve the ſquare of the ordinate or y^2 is equal to $bx + \frac{bx^2}{a}$, and therefore exceeds the product of the parameter b, by the abſciſs x.

Inſcribed HYPERBOLA. See INSCRIBED.

For the lines of an HYPERBOLA, ſee LOCUS.

For the quadrature of an HYPERBOLA, ſee QUADRATURE.

Conjugate HYPERBOLAS, a name given to four *hyperbolas*, when the firſt and ſecond axes of two oppoſite *hyperbolas* are the ſecond and firſt axes of two other oppoſite *hyperbolas*.

Thus if two oppoſite *hyperbolas* A M, *a m* (*Tab.* III. *Analyſis*, *fig.* 59.) have the line A *a*, for their firſt axis, and the line B *b* for their ſecond axis; and if two other oppoſite *hyperbolas* B S, *b s*, have on the contrary, B *b* for their firſt axis, and A *a* for their ſecond axis, theſe two *hyperbolas* B S, *b s* are ſaid to be conjugate to the *hyperbolas* A M, *a m*, and the four together are called conjugate *hyperbolas*.

The aſymptotes H C *h*, G C *g*, of the *hyperbolas* A M, *a m*, will alſo be the aſymptotes to the *hyperbolas* B S, *b s*. See L'Hopital, Sect. Coniq. art. 132.

Hyperbolas of all degrees may be expreſſed by the equation $x^m y^n = a^{m+n}$ where a is a given quantity, x an abſciſſa taken on the aſymptote, and y an ordinate to the aſymptote.

If from any point B of ſuch an *hyperbola* (*Tab.* III. *Analyſis*, *fig.* 60.) a line B C be drawn parallel to one aſymptote, and terminated by the other, and the parallelogram B C A D be completed; then will this parallelogram be to the *hyperbolic* ſpace B C E O infinitely produced, as $m - n$ to n. L'Hopital. Sect. Coniq. art. 240. Here,

1°. When $m - n$ is poſitive: that is, when m is greater than n, we may always find the quadrature of ſuch *hyperbolic* ſpaces.

2°. When $m = n$, then $m - n = 0$, and the ratio of the parallelogram is to the *hyperbolic* area as o to n. In which caſe this area becomes infinite.

3°. When m is leſs than n, $m - n$ is negative; and in this caſe the parallelogram is to the *hyperbolic* ſpace as a negative number is to a poſitive; which led Dr. Wallis and others to ſay, that theſe *hyperbolic* areas were more than infinite. See L'Hopital. Sect. Coniq. art. 242.

But the truth is, this ratio of a negative number to a poſitive only ſhews, that the ſpace bounded by D B (*the* other ſide of the parallelogram) by the curve and aſymptote infinitely produced, is to C B D A as m to $n - m$. L'Hopital, ibid. and Maclaurin's Fluxions, art. 294.

Although

Although the area comprehended between the Apollonian *hyperbola* and its aſymptote, be infinite, yet any ſegment, or ſector of this curve, may be ſquared by means of logarithms. For inſtance: ſuppoſe it required to find the area of the *hyperbola* ſegment EBCF, (*Vide* III *Analyſis*, *fig.* 61.) comprized between the arch of the curve EBF, the lines EB, FC parallel to the aſymptote AD, and BC, the portion of the other aſymptote intercepted between them. Then if ABED, the parallelogram of the *hyperbola*, be taken as unity, the ſpace EBCF will be Napier's logarithm of the ratio of AC to AB, or of BE to FG. Hence if we had tables of ſuch logarithms, we might find the area of EBCF by ſubducting the logarithm of FC from that of BE, and the diſference would expreſs the ratio of the ſegment to the parallelogram ABED or 1. But as ſuch tables are not extant, ſome further trouble is requiſite to convert the common or Briggs's logarithm into Napier's. Take therefore from the common tables the LOGARITHM of the ratio of BE to FC, that is, the diſference of their logarithms, and multiply this diſference by 2.302585, the *hyperbolic* logarithm of 10, the product will give the ratio of the ſegment to the parallelogram ABED or 1. Thus ſuppoſing BE = 30, and CF = 5, and the parallelogram ABED = 1.

From 1. 5^0. $155 = \log$. of 36.

Subduct 0.698970 = log. of 5.

Diſference 0.857325 = log. of $\frac{36}{5}$.

Then 0.857325 × 2.302585 = 1.974810 for the area of the ſegment BEFC. This multiplication may be performed in Oughtred's contracted way.

Huygens, to avoid the multiplication by 2.302, &c. finds its logarithm = 0.762158887, and always adds this to the logarithm of the difference before found, and then finds the number correſponding to this ſum. See Horol. Oſcillat. and Grandi, Dem. Theor. Huygen. in fine.

If it were propoſed to find the area of the ſector AEBF, as this is equal to the ſegment EBCF, the ſame method may ſerve. But it may alſo be done by ſeveral other analogies; ſee wherefore Cotes, Harm. Menſur. p. 10, 13. See alſo p. 25, 26, of the ſame book. See QUADRATURE.

HYPERBOLE, Τπερβολη, *ſuperiectio*, formed of the verb ὑπερβαλλω, *to exceed*, in *Rhetoric*, a figure, whereby the truth and reality of things are exceſſively either enlarged or diminiſhed. See EXAGGERATION.

The character of an *hyperbole* is to exaggerate or extenuate the idea of the thing ſpoken of, beyond the bounds of truth, or even probability. As, He ran ſwifter than the wind; he went ſlower than a tortoiſe, &c.

Hyperboles, ſays Seneca, lie without deceiving; they lead the mind to truth by fictions; they convey the ſentiments intended, though by expreſſing it in terms which render it incredible. The *hyperbole* promiſes too much, in order to make you conceive enough. There is nothing faulty in an *hyperbole*, when it is *ultra fidem*, as Quintilian ſays, provided that it be not *ultra modum*.

Ariſtotle obſerves, that *hyperboles* are the favourite figures of young authors, who love exceſs and exaggeration; but that philoſophers ſhould not uſe them without a great deal of reſerve.

The pitch to which an *hyperbole* may be carried, is a point of great delicacy; to carry it too far, is to deſtroy it: it is of the nature of a bow-ſtring, which by immoderate tenſion, ſlackens; and frequently has an effect quite contrary to that intended. Longinus.

Thoſe *hyperboles* are beſt, which are latent, and are not taken for *hyperboles*. For this reaſon, they ſhould ſcarce ever be uſed but in a paſſion, and in the middle of ſome important incident: ſuch is the *hyperbole* of Herodotus, ſpeaking of the Lacedæmonians, who fought at Thermopylæ: 'They defended themſelves, for ſome time, with 'the arms that were left them, and at laſt with their 'hands and teeth; till the Barbarians, continually 'ſhooting, buried them, as it were, with their ar-'rows.' Now what likelihood is there, that naked men ſhould defend themſelves with their hands and teeth againſt armed men, and that ſo many perſons ſhould be buried under their enemies' arrows? Yet does there appear ſome probability in the thing, by reaſon it is not ſought for the ſake of the figure; but the *hyperbole* ſeems to ariſe out of the ſubject itſelf. Id.

Of the like kind is that paſſage of a comic poet, mentioned by Longinus: 'He had lands in the country no 'larger than a Lacedæmonian epiſtle.'

There are certain manners of tempering the Raſhneſs of *hyperboles*, and giving them an air of probability. Virgil ſays, that to ſee the fleets of Antony and Auguſtus at the battle of Actium, one would have taken them for the Cyclades floating on the water: and Florus, ſpeaking of the expedition wherewith the Romans built a number of veſſels in the firſt Punic war, ſays, 'It ſeemed 'not that the ſhips were built by workmen, but that the 'trees were tranſformed into ſhips by the gods.' They do not ſay, that the ſhips were floating iſlands; nor that the trees were metamorphoſed into ſhips; but only that one might have taken them to be ſo. This precaution ſerves as a kind of paſſport to the *hyperbole*, if we may be allowed the phraſe, and makes it go down even in proſe; for what is excuſed before it is ſaid, is always heard favourably, how incredible ſoever it be. Boulours.

The exceſs in this trope is called AUXESIS; as when we ſay of any thing that is very high, *it reaches to the ſkies*: the defect or contrary extreme is termed METIOSIS; as when we ſay of a very lean perſon, *he is nothing but ſkin and bones, or a mere ſkeleton*.

HYPERBOLEON, in *Ancient Muſic*, is a name which the Greeks gave to the fifth or the moſt acute of their *tetrachords*; imagining this to be ὑπερβολαιον, *ſuperexcellens*.

HYPERBOLIC, or HYPERBOLICAL, ſomething relating either to an HYPERBOLE, or an HYPERBOLA.

HYPERBOLIC *Conoids*. See CONOID.

HYPERBOLIC *Cylindroid*, is a ſolid figure, whoſe generation is given by Sir Chriſtopher Wren, in the Philoſophical Tranſactions.

Two oppoſite *hyperbolas* being joined by the tranſverſe axis, and through the centre, a right line being drawn at right angles to that axis; and above that, as an axis, the *hyperbolas* being ſuppoſed to revolve; by ſuch revolution, a body will be generated, which is called the *hyperbolic ſpindroid*, whoſe baſes, and all ſections parallel to them, will be circles. In a ſubſequent Tranſaction, the ſame author applies the new ſcheme to the grinding of *hyperbolical* glaſſes; affirming, that they muſt be formed this way, or not at all.

HYPERBOLIC *Leg* of a curve, is that which approaches infinitely nearer to ſome aſymptote.

Sir Iſaac Newton reduces all curves, both of the firſt and of the higher kinds, into thoſe with *hyperbolic legs*, and thoſe with parabolic ones. See CURVE.

HYPERBOLIC *Line* is uſed by ſome authors for what we call the *hyperbola* itſelf.

In this ſenſe, the plane ſurface, terminated by the curve line, is called the *hyperbola*; and the curve line that terminates it, the *hyperbolic line*.

HYPERBOLIC *Logarithm*. See LOGARITHM.

HYPERBOLIC *Mirror*. See MIRROR.

HYPERBOLIC *Space*, in the *Higher Geometry*, the area or ſpace contained between the curve of the hyperbola, the aſymptote, and the ordinate.

HYPERBOLICUM *acutum*, a ſolid made by the revolution of the infinite area of the ſpace contained between the curve of the *hyperbola* and its aſymptote. This produces a ſolid infinitely long, and yet is demonſtrated to be equal to a finite ſolid or body. See *Logarithmic* CURVE.

HYPERBOLIFORM *Figures*, are ſuch curves as approach, in their properties, to the nature of the *hyperbola*; called alſo *hyperboloides*.

HYPERBOLOIDES, are *hyperbolas* of the higher kind, whoſe nature is expreſſed by this equation: $ay^{n+1} = b \cdot x^{n} \cdot (a+x)$. See HYPERBOLA.

HYPERBOREAN, Τπερβορεοι, in the *Ancient Geography*. The ancients denominated thoſe people and places *Hyperborean*, which were to the northward of the Scythians. They had but very little acquaintance with theſe *Hyperborean* regions; and all they tell us of them is very precarious, and much of it falſe.

Diodorus Siculus ſays, the *Hyperboreans* were thus called becauſe they dwelt beyond the wind *Boreas*; ὑπερ, ſignifying *above* or *beyond*; and Βορεας, the north wind. This etymology is very natural and plauſible; notwithſtanding all that Rudbeck has ſaid againſt it, who would have the word to be generally Gothic, and to ſignify *nobility*.

Herodotus doubts, whether or no there were any ſuch thing as *Hyperborean* nations: Strabo, who profeſſed that he believed there were, does not take *Hyperborean* to ſignify *beyond Boreas*, or the north, as Herodotus underſtood it: the prepoſition ὑπερ, in this caſe, he ſuppoſes only to help in forming a ſuperlative; ſo that *hyperboreus*, on his principle, means no more than *moſt northern*: by which it appears the ancients ſcarce knew themſelves what the name meant by it. Moſt of our modern geographers, as Hoffman, Celarius, &c. have placed the *Hyperboreans* in the northern parts of the European continent, among the Siberians and Samoiedes: according to them the *Hyperboreans* of the ancients were thoſe, in general, who lived fartheſt to the north. The *Hyperboreans* of our days are thoſe Ruſſians who inhabit between the Volga and the White Sea. According to Cluvier, the name Celtes was ſynonymous with that of *Hyperboreans*.

HYPERCATALECTIC, Τπερκαταληκτικος, compoſed of ὑπερ, *over*, *beyond*, and καταληγω, *I put to the number*, *I add*; ſo that *hypercatalectic* denotes as much as *ſuperadded*; in the *Greek* and *Latin Poetry*, is applied to

verses which have one or two syllables too much; or beyond the regular measure. See VERSE.

The Greek and Latin verses are distinguished, with respect to their measure, into four kinds: *acatalectic* verses, where nothing is wanting at the end; *catalectic*, which want a syllable at the end; *brachycatalectic*, which want a whole foot at the end; and lastly, *hypercatalectic*, which have one or two syllables too many. These last are also called *hypermeters*.

HYPERCATHARSIS, Ὑπερκάθαρσις, compounded of the Greek ὑπὲρ, *supra*, and καθαίρω, *I purge*, in *Medicine*, *super-purgation*; a too violent, and excessive PURGATION.

HYPERCHIRIA, in *Mythology*, a title of Juno, under which she was worshipped in Laconia.

HYPERCRISIS, Ὑπερκρίσις, compounded of ὑπὲρ, *supra*, and κρίσις, *crisis*, *judgment*, in *Medicine*, any immoderate critical excretion.

Thus, when a fever terminates in a looseness, the humours sometimes flow off faster than the strength can bear, and are therefore to be checked. This is a *hypercrisis*.

HYPERCRITIC, compounded of ὑπὲρ, *supra*, and κριτὴς, of κρίνω *judico*, of κρίνω, *I judge*; an over-rigid censor, or critic; one who will let nothing pass, but animadverts severely on the slightest fault.

HYPERDIAZEUXIS, in *Ancient Musick*, denotes the entire interval of the DIAPASON between two tetrachords; as between the *hypaton* and *hyperbolæon*.

HYPER-DORIC, in *Ancient Musick*, was the name of one of their modes, called also *Mixolydian*: it obtained this appellation, because its fundamental was one fourth above that of the Doric. See MODE.

HYPERDULIA, Ὑπερδουλία, compounded of ὑπὲρ, *above*, and δουλεία, *worship*, in the *Romish Theology*, is the worship rendered to the holy VIRGIN.

The worship offered to saints is called *dulia*; and that to the mother of God, *hyperdulia*; as being superior to the former.

HYPER-ÆOLIAN, in *Ancient Musick*, is one of the names of the Greek modes; so called, because its fundamental was one fourth above that of the Æolian, from which it derived its origin.

HYPERICOIDES, in *Botany*. See St. PETER'S *wort*.

HYPERICUM, in *Botany*. See JOHN'S *wort*.

HYPERINESIS, of ὑπὲρ, and ἔνεσις, *purgation*, a word used by Hippocrates for any excessive evacuation, but most frequently in the same sense as hypercatharsis, an over-purging.

HYPER-IONIAN, in *Ancient Musick*, one of the Greek modes, whose fundamental was one fourth above the Ionian: it is the fifth mode ascending in the scale.

HYPER LYDIAN, was the most acute of the fifteen Greek modes. Its fundamental was a fourth above the Lydian.

HYPERMETER, compounded of ὑπὲρ, *supra*, and μέτρον, *measure*, in the *Ancient Poetry*, the same with HYPERCATALECTIC.

HYPEROA, a word applied by authors to the upper part, or palate of the mouth, and the inside cerebri. It properly signifies any upper place.

HYPEROCHE, in *Musick*, is the difference between the enharmonic and chromatic diesis. It is expressed by the proportion of 3125 to 3072: for, $\frac{128}{125} = \frac{25}{24} \cdot \frac{125}{128}$. Mr. Heusing has made use of this term. Music. Berol. vol. 1. p. 270, 280.

HYPERO-PHARYNGÆI, in *Anatomy*, a name given by M. Santorini to the PERISTAPHYLO-PHARYNGÆI muscles.

HYPER-PHRYGIAN, in *Ancient Musick*, called by Euclid *Hypermixolydius*, was the most acute of the thirteen modes of Aristoxenus.

HYPERSARCOSIS, Ὑπερσάρκωσις, in *Medicine* and *Surgery*, an excess of flesh; or rather, a fleshy excrescence, such as those generally arising on the lips of wounds, &c.

HYPERTHYRON, formed of ὑπὲρ, *over*, and θύρα, *gate*, in the *Ancient Architecture*, a sort of table used after the manner of a frieze, over the jambs of Doric doors and gates, and the thirds of windows. It lies immediately under the corona; and is by our workmen usually called the *lintel-piece*.

HYPETHRE, in *Ancient Architecture*, two rows of pillars surrounding, and ten at each face of any temple, &c. with a peristyle within of six columns. See HYPETHROS.

HYPHEN, Ὑφὲν, in *Grammar*, an accent or character, which implies, that two words are to be joined, or connected into one compound word.—As, *male-administration*, &c.

Hyphen serve also to connect the syllables of such words as are divided by the end of the line.

HYPHIALTES, Ἐφιάλτης, in *Mythology*, names given by the Greeks to certain rural divinities answering to the INCUBI of the Romans.

HYPNOTIC, Ὑπνωτικὸν, derived from ὕπνος, *sleep*, in *Medicine*, a remedy which promotes or induces sleep; called also *soporific* and *opiate*. See also NARCOTICS.

HYPNOTICUS *serpens*, the *sleep-snake*, in *Zoology*, the name of an East Indian species of serpent, called by the Ceylonese *mettipolong*, a word importing the same sense. It is of a deep blackish brown, variegated with spots of white, and is a very fatal kind in its poison, its bite always bringing on a sleep which ends in death.

HYPNUM, in *Botany*, the name of a genus of mosses of the *cryptogamia* class, the characters of which are these: the capsules or heads are uniform, and covered with a calyptra and operculum; they are usually of an oval or oblong figure, and commonly stand on long pedicles which arise from the axe of the leaves, and are surrounded at the bottom with a foliaceous or lanuginous bed different from the leaves; this covering of the bottom of the stalk, is called by authors perichætium, and is itself a sufficient distinction of the *hypna* from all other mosses, the bryа, tonia, sphagna, &c. having none of them any such thing. To this is to be added, that the branches of the *hypnums* are usually spread about upon the ground, and are perennial; and that there is what botanists call a *facies propria*, or peculiar look of the plant, which at first sight distinguishes the genus to an observer used to such things. Dillen. Hist. Muscor. p. 276.

As the family of the *hypna* is very numerous, they are usually divided into several orders. Of the first order are those *hypna* which have erect heads, or at least such as are but a little bent; and of this order the first series comprehends such as are pinnated, or whose pinnæ are placed in two, sometimes in three rows on each stalk, or in the same plane. The first division of this series comprehends those which have flat and smooth pinnæ.

The second division of this series of the *hypnums*, contains those which have undulated and curled leaves.

The second series of the *hypnums* is that of the fern-like kinds, called by many fern-mosses; these have their stalks every way surrounded with leaves, and their ramifications all placed in the same plane, so that they resemble the ferns.

The third series comprehends the squarrose *hypnums*; that is, such as have their leaves every way surrounding the stalks in the manner of scales. Of these the first division contains such as have their leaves and the ends of the branches bent downwards.

The second division of this series of the *hypnums*, takes in those which are squarrose and dentated; a first subdivision of these also is established, to comprehend such as have their leaves standing out, whether broad or narrow.

The second subdivision of these *hypnums*, comprehends those whose leaves being closely applied to the stalks, give them a cylindric figure.

The third division of this order of *hypna*, comprehends those called the *trichoide* and silky ones; these have extremely fine and small leaves, placed in the manner of scales, one over another.

The second order of the *hypnums* contains those with pendulous heads.

The third order of the *hypna* contains a number of species less known than the others, and about which there is some doubt among authors, whether they are truly *hypna* and regularly distinct from the others.

All these last are described by Pontedera, but imperfectly; and both they, and many of Micheli's, probably belong to some of the besore mentioned species; but as they want in the descriptions and figures the distinguishing characters of the species, Dillenius has prudently avoided determining any thing about them. Ibid. p. 342.

HYPO, Ὑπὸ, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting *under*, *beneath*.—In which sense it stands opposed to ὑπὲρ, *supra*, *above*.

HYPOBOLE, from ὑπὸ, and βάλλω, *I cast*, or SUBJECTION, in *Rhetoric*, a figure so called, when several things are mentioned, that seem to make for the contrary side, and each of them refuted in order. This figure, when complete, consists of three parts; a proposition, an enumeration of particulars with their answer, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing so quietly, and not opposing the faction that ejected him. Pro. Dom. cap. 35.

HYPOCATHARSIS, Ὑποκάθαρσις, compounded of. ὑπὸ, *under*, and καθαίρω, *I purge*, in *Medicine*, a too faint or feeble PURGATION.

HYPOCAUSTUM, Ὑποκαυστὸν, formed of the preposition

tion *ὑπὸ*, *under*, and the verb *καιω*, *I burn*, among the Greeks and Romans, was a subterraneous place, wherein was a furnace that ſerved to heat the baths.—Vitruvius calls it CALDARIUM.

The ancients had properly two ſorts of *hypocauſta*; the one called by Cicero *vaporarium*, and by others *laconicum* or *ſudatio*; which was a large ſweating bath, in which were three brazen veſſels called *caldarium*, *tepidarium*, and *frigidarium*, according to the water contained therein.

The other *hypocauſtum* was a ſort of *furnace* or oven to heat their winter parlours, or *cœnationculæ hybernæ*.

The latter *hypocauſtum* was called *aheneæ* and *fornaces*; and the man that tended the fire, *fornacator*. See BATHS.

The remains of a Roman *hypocauſtum*, or ſweating room, were diſcovered under ground at Lincoln, in 1739. We have an account of theſe remains in the Phil. Tranſ. N° 461. ſect. 29. See Abr. vol. ix. p. 455.

HYPOCAUSTUM, among the moderns, is that part or place where the fire is kept that warms a STOVE, or HOT-*houſe*.

HYPOCHÆRIS, in *Botany*, the name of a genus of plants of the *ſyngeneſia polygamia æqualis* claſs; the characters of which are theſe: the common cup is of an imbricated figure, and is ſwelled at the baſe, and compoſed of ſharp-pointed ſcales; the flower is of the compound kind, it is imbricated and uniform; the ſeparate flowers of which this is compoſed are numerous, and equal in ſize; each is compoſed of one leaf, and is narrow, of a ligulated ſhape, truncated, and divided into five ſegments at the edge; the ſtamina are five very ſhort and capillary filaments; the anthers are cylindric and tubular; the germen of the piſtil ſtands under the flower; the ſtyle is capillary, and of the length of the ſtamina; the ſtigmata are two in number, and are reflex; the cup, after the flower is fallen, ſerves as a ſeed-veſſel; its ſcales cloſe at the top, and it becomes of a roundiſh but pointed figure; the ſeeds are ſingle and oblong, and terminate in a tubulated and papoſe ſtalk: the receptacle is beſet all over with little chaffy ſubſtances: theſe are of the length of the ſeeds, and are placed between them.

Linnæus makes this genus comprehend the *hypocheris* and the achyrophorus of Vaillant: the only difference between which is, that the *hypocheris* has a roundiſh cup all over imbricated, and a plumoſe down upon the ſeeds; whereas the achyrophorus has an oblong cup, which is imbricated only at the baſe, and a ſimple down on the ſeed.

HYPOCHONDRIA, Ὑποχόνδρια, compoſed of the prepoſition ὑπὸ, under, and χονδρὸς, *cartilage*; q. d. *cartilagines ſubjacentes*, or under the cartilages of the ribs, &c. in *Anatomy*, a ſpace on each ſide the epigaſtric region, or upper part of the lower belly. See ABDOMEN, and EPIGASTRIC.

The *hypochondria* compoſe the upper part of the epigaſtrium. They are ſituate on each ſide, between the cartilago enſiformis, the cartilages of the ribs, and the tip of the breaſt; and are divided, with reſpect to their ſituation, into *right* and *left*.

In the *right hypochondrium* the liver is found; and in the *left* the ſpleen, and a great part of the ſtomach.

Hippocrates ſometimes uſes the word *hypochondrium* for the whole lower venter or belly.

The *hypochondria* are ſubject to divers diſorders.

HYPOCHONDRIAC *affection*, or *paſſion*, in *Medicine*, a popular diſeaſe, otherwiſe called the *ſpleen*, *vapours*, &c. is a ſpaſmodico-flatulent affection of the ſtomach and inteſtines, ariſing from an irregularity of the periſtaltic motion, cauſed by the ſtagnation of the blood and vital fluids, between the nervous and muſcular coats of the inteſtines.

The *hypochondriac* is a very comprehenſive diſeaſe: it is variouſly denominated, according to the various ſymptoms it is attended with, and the various parts where it is ſuppoſed to be ſeated, or in which it ariſes.

When conceived as ſituate in the *hypochondriac* regions, or ariſing from ſome diſorder of the parts contained therein, viz. the ſpleen, liver, &c. it is properly called the *hypochondriacal diſeaſe*, *ſpleen*, &c.

When conceived as owing to ſome diſorder of the womb, it is called the HYSTERIC *affection*, &c.

And laſtly, when the flatulent rumblings in the inteſtines, belchings, &c. are conſidered, it is called the VAPOURS.

The *hypochondriac* is a very common and very obſtinate diſeaſe: few men of a ſedentary life, and fewer women are free from it. It becomes daily more common in this country, owing, without doubt, to the increaſe of luxury, and ſedentary employments. Its ſymptoms are very numerous: the moſt uſual are, a pain in the ſtomach, windineſs, coſtiveneſs, vomitings, a ſwelling or diſtenſion of the *hypochondria*, or upper part of the belly, miſts and rumblings in the lower venter, wandering pains, a conſtriction of the breaſt, difficulty of breathing, palpitation of the heart, faintings, watchings, inquietudes, ſwimming of the head, fear, ſuſpicions, melancholy, delirium, &c. Not that all theſe accidents befal every perſon ſeized with this diſeaſe; but ſometimes ſome of them, and at other times others, according to the conſtitution, &c. of the patient.

In effect, the *hypochondriac* is a very vague indeterminate ſort of diſorder. Dr. Sydenham obſerves that its ſymptoms are ſo exactly thoſe of moſt other diſeaſes; and that whatever part it is in, it produces ſomething like the common diſeaſes of that part.—Thus, in the head it produces a ſort of apoplexy; fits like the epilepſy, called *hyſteric* fits; intolerable head-achs, &c. In perſons affected with the chlorioſis, it produces a palpitation of the heart: ſometimes, though rarely, it ſeizes the lungs, and cauſes a continual dry cough: it alſo imitates the colic, and iliac paſſion, and ſometimes the ſtone, jaundice, &c. In the inteſtines it produces a diarrhœa; in the ſtomach, nauſeas: ſometimes it ſeizes the external parts, and particularly the back, which it renders chilly and painful, and the legs and thighs, which it ſwells ſo as to reſemble the dropſy: ſeizing the teeth, it reſembles the ſcurvy (indeed, Etmuller makes the ſcurvy itſelf to be only a great degree of this diſeaſe.) Laſtly, which is the moſt unhappy circumſtance of all, the patient is ſometimes more affected in mind than in body.

The primary ſeat of this diſeaſe is in the ſtomach and bowels, though it ſenſibly affects the animal ſpirits, and the nervous ſyſtem. To this purpoſe Hoffman ſays that the periſtaltic motion in the bowels is retarded by ſpaſms. By ſome its cauſe is referred to an acid fait abounding in the maſs of blood; to which the ill diſpoſition of the ſtomach, and the other parts contained in the epigaſtrium, may greatly contribute. Putrid aliments, crudities and indigeſtions are the *prime* cauſe. According to Sydenham, vehement motions of the body, or more uſually violent perturbations of the mind, as grief, anger, fear, &c. are its procatarctic cauſes. It is uſually brought on by long and ſerious attention to abſtruſe ſubjects, grief, the ſuppreſſion of cuſtomary evacuations, exceſs of venery, the repulſion of cutaneous eruptions, long continued evacuations, obſtructions in ſome of the viſcera, as the liver, ſpleen, &c. In ſome there is an habitual diſpoſition to this diſorder, and ſuch people have generally a ſallow or brown complexion, and a downcaſt look. Whatever may give *riſe to nervous diſorders* in general, may be a cauſe of this in particular. Thoſe will be always more or leſs ſubject to this diſorder, whoſe ſtomachs generate acidities from fermentation, or where there is a putrefactive diſpoſition in the alimentary ſolids and fluids, the gut, ſeparated by either of theſe cauſes, is ſuddenly diffuſed, and contributes to repel the vital heat, wherever it is preſent in any conſiderable degree.

It is obſervable, that perſons ſubject to this diſorder very rarely fall into continued, epidemic, or contagious fevers, and even eſcape the plague, and remain free from any other diſorders. Hoff. Oper. tom. iii. p. 65.

This diſorder is confounded by Sydenham and others, with HYSTERICS; but Hoffman inſiſts that the diſtinction is conſiderable, and deſerves to be attended to in practice.

For the cure, the principal indications are to correct the vicious cauſe in the ſtomach, to ſtrengthen the alimentary canal, to increaſe the vital heat, and to promote the ſecretions, which is to be affected, after proper evacuations, by occaſional emetics and purges, by chalybeates, bitters, ſtrengtheners, and volatile ſpirits. The different preparations of iron, and the Peruvian bark, have conſiderable virtues in this diſeaſe. When the patient is coſtive, two, three, or four pills, compoſed of equal parts of aloes, rhubarb, and aſſa fœtida, with a ſufficient quantity of the elixir proprietatis, may be taken occaſionally, to keep the body gently open. Thoſe who cannot bear the aſſa fœtida may uſe Spaniſh ſoap.

Hypochondriac perſons ought never to faſt long, and their food ſhould be ſolid and nouriſhing: they ſhould avoid all aceſcent and windy vegetables. Fleſh meats are moſt proper, and their drinks ſhould be old claret or Madeira, or water with a little brandy or rum; but every kind of exceſs is hurtful. They ſhould be careful to uſe every method for preſerving cheerfulneſs and ſerenity of mind. Exerciſe of every kind, particularly riding, is uſeful. The cold bath is likewiſe beneficial; and where this does not agree with the patient, friction with a fleſh-brush, or a courſe cloth, may be tried. A voyage, or a long journey, eſpecially towards a warmer climate, will be of greater ſervice than any medicine. Buchan's Dom. Med p. 491, &c. ed. 1776. See NERVOUS *Diſeaſes*.

HYPOCHONDRIACAL *medicines*, are remedies proper in the *hypochondriacal* diſeaſe.

Such are all thoſe which tend to purify the blood, humours, and ſpirits; as chervil, balm, agrimony, St. John's wort, and the other zephalic and cardiac herbs: ſuch alſo are thoſe which purge melancholy, or atrabilis, according to the old authors, and thoſe which diſpel wind and vapours; and all medicines good for diſorders of the

nerves

nerves, particularly vervain, both male and female; but above all, frequent, gentle, anodyne purges are excellent. See the preceding article.

HYPOCHONDRIACAL *region*. See HYPOCHONDRIA.

HYPOCHYMA, or HYPOCHYSIS, *ὑπόχυμα*, literally denoting *shedding*, *effusion*, or *pouring out*, the disease having formerly been supposed to arise from an effusion of some viscid humour upon the pupil, in *Medicine*, a disease of the eyes, more usually called a CATARACT.

HYPOCISTIS, *Τυπόκιστις*, formed of *ὑπὸ*, *under*, and *κίστος*, *cistus*, in *Medicine*, a juice used in the composition of theriacs, &c.

The *hypocistis* is the juice of a shoot or excrescence of the same name, springing out from the foot of a kind of cistus, or rock-rose, which is called *ledon* or *ladanifera*; common enough in the hot countries.

The shoot grows about three or four inches high; and one, two, or three inches thick; and is somewhat bigger at top than at bottom; and is soft, succulent, of a yellowish colour, and surrounded from space to space with a fort of rings, or brownish knots. It bears a number of little bell-shaped flowers, but no leaves.

When gathered, they pound it in a mortar, and express the juice: that done, they evaporate it on the fire till it come to the consistence of a hard blackish extract, much like Spanish liquorice; then they make it up into little masles for carriage. It is a mild astringent, of no particular smell or flavour, and recommended for stopping fluxes of the belly, vomitings, and hæmorrhages; though anciently much more than at present. It is also an ingredient in some unguents.

It is sometimes used as a substitute to acacia.—Dr. Quincy says, it is the more powerful astringent of the two.

HYPOCRAS. See HYPOCRAS.

HYPOCRATERIFORMIS, *salver-shaped*, in *Botany*, the name given by Mr. Tournefort to a peculiar sort of flowers or plants, of the general order of the INFUNDIBULIFORMIS, but not so deep and narrow at the mouth as those simply so called, but expanded into the figure of a saucer.

HYPOCRINE, or HIPPOCRENE. See HELICON.

HYPOCRISY, *hypocrisis*, in *Ethics*, denotes dissimulation with regard to the moral or religious character.

HYPODIACONORUM *festum*. See UALENDARIUM *festum*.

HYPO-DORIAN, in *Ancient Musick*, is the graveft of all the modes but fundamental is a fourth below the Dorian mode.

HYPODROME. See HIPPODROME.

HYPO-EOLIAN, in *Ancient Musick*, one of the Greek modes, called by Euclid the grave hypolydian. Its fundamental is a fourth above the *proslam*.

HYPOGEUM, *ὑπόγειον*, formed of *ὑπὸ*, *under*, and *γῆ*, *earth*, in the *Ancient Architecture*, is a name common to all the parts of a building that are under ground; as the cellar, basement, and the like places.

The *term hypogeum* was also used by the Greeks and Romans for subterraneous tombs in which they buried their dead.

HYPOGEUM, *Τυπόγειον*, in *Astrology*, is a name given to the celestial houses which are below the horizon; and especially the *imum cœli*, or bottom of heaven.

HYPOGASTRIC *region*. See HYPOGASTRIUM.

HYPOGASTRIC *artery*, is an artery arising from the iliaca interna, and distributed to the bladder, the rectum, and the genital parts, particularly in women.

HYPOGASTRIC *vein*, arises in the same parts, and discharges itself into the iliaca interna.

HYPOGASTRIUM, formed of *ὑπὸ*, *under*, and *γαστὴρ*, *belly*, in *Anatomy*, the lower part of the abdomen, or lower venter; commencing from two or three inches below the navel, and extending to the os pubis.

HYPOGLOSSI *externi*, or *majores*, are the ninth pair of nerves, called also *linguales* & *guttorii*. They have their origin just above the foramen magnum, and go out at the foles of the same great hole, above the condyles of the os occipitis. As soon as they are pulled out of the cranium, they run between the carotid artery and the internal jugular vein, to the tongue, on the side of the digastric muscle.

HYPOGLOTTIS, or HYPOGLOSSIS, compoſed of *ὑπὸ*, *under*, and *γλῶττα*, *tongue*, in *Anatomy*, is a name given to two glands of the tongue.

There are four large glands of the tongue, two of them called *hypoglottides*, ſituated under it, near the vena ranina, one on each ſide of the tongue. They ſerve to ſeparate a kind of ſerous matter, of the nature of ſaliva, which they diſcharge into the mouth by little ducts near the gums.

HYPOGLOTTIS, or HYPOGLOSSIS, in *Medicine*, denotes an inflammation or ulceration under the tongue; called alſo RANULA.

HYPO-IONIAN, in *Ancient Muſick*, the ſecond of the Greek modes, called by Euclid *hypoiaſtian*, and *graveſt hypoiaſtian*. Its fundamental is a fourth below the *ſuperior*.

HYPO-LYDIAN, in *Ancient Muſick*, a mode which is a fourth below the Lydian.

HYPO-MIXOLYDIAN, in *Ancient Muſick*, a mode ſaid to be added by Guy d'Arezzo. Its fundamental is a fourth above the Mixolydian or Dorian.

HYPOMNEMATOGRAPHUS, *Τυπομνηματογράφος*, derived from *ὑπὸ*, *μνημα*, *regiſter*, and *γράφω*, *I write*, in the *Primitive Church*, an officer who attended on the biſhop, and kept a regiſter of his conſecrations.

HYPOMOCHLION *Τυπομόχλιον*, formed of *ὑπὸ*, *under*, and *μοχλὸς*, *lever*, in *Mechanics*, the fulcrum of a LEVER; or the point which ſuſtains its preſſure, when employed either in raiſing or lowering bodies.

The *hypomochlion* is frequently a roller ſet under the lever; or under ſtones, pieces of timber, &c. that they may be the more eaſily lifted up, or removed.

HYPONITIS, in *Botany*, a name given by Dillenius to a genus of plants, called by Tournefort *orobanchoides*. See MONOTROPA.

HYPOPHORA, *Τυπόφορα*, in *Rhetoric*, the firſt part of the PROLEPSIS: thus, in the following inſtance: *But ſome man will ſay, how are the dead raiſed, or with what body do they come?* is the *hypophora*; and, *thou fool, that which thou ſoweſt, &c.* is the *anthypophora*, or ſolution of the objection.

HYPOPHORA, from *Τυπόφορμαι*, *I am conveyed away*, in *Surgery*, is uſed for a deep ſinuous ulcer.

HYPO-PHRYGIAN, in *Ancient Muſick*, the ſixth ſpecies of the *diapaſon*.

HYPOPHTHALMION, denotes that part under the eye which is ſubject to ſwell in a cachexy or dropſy.

HYPOPHTHALMUM, in *Botany*, a name uſed by ſome authors for the *other antiqua*.

HYPOPHYLLO-PERMOUS *plants*, formed of *ὑπὸ*, *under*, *φύλλον*, *leaf*, and *σπέρμα*, *ſeed*, are ſuch plants as bear their ſeeds on the back-ſides of their leaves.

HYPOPODIUM, in *Antiquity*, a piece of furniture belonging to the baths; its uſe was to ſet or reſt the feet on, as the name imports.

HYPOPROSLAMBANOMENOS, in *Muſick*, the name of the chord added by Guido Aretine, below the *proſlambanomenos* of the Grecian ſcale, anſwering to our G. See DIAGRAM.

HYPOPYON, *Τυπύον*, formed of *ὑπὸ*, *under*, and *πύον*, *pus*, in *Medicine*, a diſeaſe of the eyes. It conſiſts in a collection of pus under or behind the cornea, which ſometimes covers the whole pupil, and obſtructs the ſight.

Some will have this diſorder the ſame with *argema*; but the more accurate make a difference.

The *hypopyon* ariſes from a rupture of the veſſels in the cornea, occaſioned either by ſome external violence, or the acrimony of the blood therein.

In the beginning, it is attended with acute pain in the head and eye; and according to the degree of the diſorder, it is followed by dimneſs of ſight, blindneſs, or death. It is very difficult of cure.—The ſuppuration is to be prevented by proper cataplaſms; or, if theſe will not take effect, it is to be promoted.

The cure of this diſtemperature of the eyes is ſometimes effected by violently ſhaking the head. The ancients uſed this practice as an approved remedy; and accident has ſhewn it to be often ſucceſsful: ſtill the jolting of a chariot, in a long journey, having been known to remove the diſorder, by making the purulent matter ſubſide behind the uvea. This method of ſhaking oughr, therefore, always to be made the firſt attempt, to give relief in this caſe, diſpoſing the patient's head in a ſupine poſture and preſſing the eye before-hand with the fingers, in order to remove, or at leaſt looſen the matter. In the beginning of the diſorder the cure may be attempted by reſolvent medicines, ſuch as a frequent application of a decoction of ſage in wine, with bleeding and purging. But if theſe attempts prove unſucceſsful, the neceſſary operation muſt be performed. The patient muſt be ſeated againſt the light, with his head and hands firmly ſecured by an aſſiſtant. The ſurgeon is then to depreſs the lower eyelid, while the aſſiſtant elevates the upper; and the ſurgeon is then with a lancet to incide cauſiouſly through the cornea, below the pupil, making the opening large enough to diſcharge the matter, with the aqueous humour; but taking great care not to wound the uvea behind the matter. About three or four hours afterward the eye muſt be dreſſed with a compreſs, dipped in a collyrium of roſe-water, white of eggs, mucilage of quince ſeeds, and a little camphor; and by this means the wound in the cornea will be healed, the aqueous humour will be reſtored, and if none of the internal parts are injured, the patient will recover his ſight. Heiſter.

HYPORCHEMA, formed of *ὑπορχέομαι*, *I accommodate my dances to a ſinging chorus*, of *ὑπὸ* and *ὀρχέομαι*, *I dance*, in the *Greek Poetry*, a poem compoſed of divers kinds

kinds of verſes, and of different lengths; but always very ſhort, and full of Pyrrhic feet. This poem was compoſed either to be ſung or played with the flute or cithara, but to regulate a dance according to the ſound of voices and inſtruments. Proclus ſays, it was a dance accompanied with a ſong.

HYPOSCENIUM, *Ὑποσκήνιον*, in *Antiquity*, a partition under the pulpit or logeum of the Greek theatre, appointed for the muſic.

HYPOSCHESIS, *Ὑποσχέσις*, in *Rhetoric*, the ſame with DIVISION.

HYPOSPADIAS, in *Surgery*, from *ὑπο*, *under* and *σπαω*, *I draw*, a Greek name anciently given to a perſon, who had the orifice of the canal of the ureter not directly at the extremity of the gland. Galen applies the ſame name to thoſe the frenum of whoſe penis is too ſhort, on which account it is bent in erection; this is eaſily remedied by cutting the ligament, and waſhing the wound with warm wine.

HYPOSPATHISMUS, in the *Ancient Surgery*, an operation practiſed, by making three inciſions in the forehead, to the very bone, about two inches long; in order to cut or divide all the veſſels between thoſe inciſions. The deſign of the operation was to prevent defluxions on the eyes.

The word is *ὑποσπαθισμος*, formed of *ὑπο*, *under*, and *σπαθη*, *ſpatula*; by reaſon after inciſions were made they thruſt a ſpatula all along between the pericranium and the fleſh.

HYPOSTASIS, *Ὑποστασις*, compounded of *ὑπο*, *under*, and *στασις*, *I ſtand*, *I exiſt*, q. d. *ſubſiſtentia*, a Greek term, literally ſignifying *ſubſtance*, or *ſubſiſtence*; it is uſed in theology for *perſon*.

Thus ſome have held, that there is but one nature or eſſence in God, but three *hypoſtaſes*, or perſons.

The term *hypoſtaſis* is of a very ancient ſtanding in the church. St. Cyril repeats it divers times, as alſo the phraſe *union according to hypoſtaſis*. The firſt time it occurs in all Chriſtian antiquity, is in a letter of that father to Neſtorius, where he uſes it inſtead of *προσωπον*, the word we commonly render *perſon*, which did not ſeem expreſſive enough. 'The philoſophers, ſays St. Cyril, have 'allowed three *hypoſtaſes*: they have extended the divi'nity to three *hypoſtaſes*: they have even ſometimes uſed 'the word *trinity*: and nothing was wanting but to have 'admitted the conſubſtantiality of the three *hypoſtaſes*, to 'ſhew the unity of the divine nature, excluſive of all 'triplicity in reſpect of diſtinction of nature, and not to 'hold it neceſſary to conceive any reſpective inferiority 'of *hypoſtaſes*.'

This term has occaſioned great diſſenſions in the ancient church; firſt among the Greeks, and afterwards alſo among the Latins.

In the council of Nice, *hypoſtaſis* was defined to denote the ſame with *eſſence*, or *ſubſtance*; ſo that it was barely to ſay that Jeſus Chriſt was of a different *hypoſtaſis* from the Father; but cuſtom altered its meaning. See TRINITY.

HYPOSTASIS, in *Medicine*, the ſediment of the urine, or that thick heavy part of the urine, which ſubſides and ſettles at bottom.

HYPOSTATICAL, in *theology*, is a term uſed in ſpeaking of the myſtery of the incarnation.

Hypoſtatical union, is a phraſe uſed by ſome divines for the union of the human nature with the divine in the perſon of Jeſus Chriſt.

HYPOSTATICAL *principles*, among the *chemiſts*, and particularly the *Paracelſiſts*, are the three chemical elements, *ſalt*, *ſulphur*, and *mercury*; called alſo the *tria prima*. See PRINCIPLE and ELEMENT.

HYPOTHECA, in the *Civil Law*, an obligation, whereby the effects of a debtor are made over to his creditor, to ſecure his debt.

The word comes from the Greek, *ὑποθηκη*, *a thing ſubject to ſome obligation*; of the verb *ὑποτιθημι*, *ſuppono*, *I am ſubjected*; of *ὑπο*, *under*, and *τιθημι*, *pono*, *I put*.

As the *hypotheca* is an engagement procured on purpoſe for the ſecurity of the creditor, various means have been made uſe of to ſecure to him the benefit of the convention. The uſe of the pawn or pledge is the moſt ancient, which is almoſt the ſame thing with the *hypotheca*: all the difference conſiſting in this, that the pledge is put into the creditor's hands: whereas, in a *ſimple hypotheca*, the thing remained in the poſſeſſion of the debtor. It was found more eaſy and commodious to engage an eſtate by a civil covenant than by an actual delivery: accordingly, the expedient was firſt practiſed among the Greeks; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds, uſed to fix ſome viſible mark on the thing, that the public might know it was *hypothecate*, or mortgaged by the proprietor; but the Romans, looking on ſuch adverriſements as injurious to the debtor, forbad the uſe of them.

The Roman lawyers diſtinguiſhed four kinds of *hypotheca*: the *conventional*, which was with the will and conſent of both parties: the *legal*, which was appointed by law, and for that reaſon called *tacit*: the *prætor's pledge*, when by the flight or non-appearing of the debtor, the creditor was put in poſſeſſion of his effects; and the *judiciary*, when the creditor was put in poſſeſſion by virtue of a ſentence of the court.

The *conventional hypotheca* is ſubdivided into *general* and *ſpecial*. The *hypotheca* is *general*, when all the debtor's effects, both preſent and future, are engaged to the creditor. It is *ſpecial*, when limited to one or more particular things.

For the *tacit hypotheca*, the civilians reckon no leſs than twenty ſix different ſpecies thereof.

HYPOTHECATE, from the Latin, *hypotheca*, *a pledge*: to *hypothecate* a ſhip, is to pawn the ſame for neceſſaries: and a maſter may *hypothecate* either ſhip or goods, for relief when in diſtreſs at ſea. For he repreſents the traders as well as the owners; and in whoſe hands ſoever a ſhip or goods *hypothecated* come, they are liable. 1 Salk. 34. 2 Litt. Abr. 95.

HYPOTHENAR, compounded of *ὑπο*, *ſub*, and *θεναρ*, *the hollow of the hand*, in *Anatomy*, the ſecond muſcle of the little finger.

The *hypothenar* ariſes from the little bone of the carpus, ſituate over the others, and is inſerted externally into the firſt bone of the little finger, which it ſerves to withdraw from the reſt.

The ſixth and laſt muſcle of the toes is alſo called *hypothenar*, or abductor.

HYPOTHENUSE, or rather, HYPOTENUSE, *ὑποτεινουσα*, *ſubtendens*, formed of *ὑποτεινω*, *ſubtendo*, *I ſubtend*, in *Geometry*, is the longeſt ſide of a right-angled triangle; or that ſide which ſubtends, or is oppoſite to, the right angle.

Thus in the triangle KML (*Tab. Geometry, fig.* 19) the ſide ML, oppoſite to the right angle K, is called the *hypothenuſe*.

It is a celebrated theorem in geometry, that in every rectilineat right-angled triangle, as KML, the ſquare of the *hypothenuſe*, ML, is equal to the ſquares of both the other ſides, KL and KM. This is particularly called the Pythagorean theorem, from its inventor Pythagoras, who is ſaid to have ſacrificed a whole hecatomb to the Muſes, in gratitude for the diſcovery.

HYPOTHESIS, *ὑποθεσις*, formed of *ὑπο*, *under*, and *θεσις*, *poſitio*, of *τιθημι*, *pono*, *I put*, in *Logic*, is a propoſition or principle which we ſuppoſe, or take for granted, in order to draw concluſions for the proof of a point in queſtion.

In diſputation they frequently make falſe *hypotheſes*, in order to draw their antagoniſts into abſurdities; and even in geometry, truths are often deducible from ſuch falſe *hypotheſes*.

Every conditional or hypothetical propoſition may be diſtinguiſhed into *hypotheſis* and *theſis*: the firſt rehearſes the conditions under which any thing is affirmed or denied; and the latter is the thing itſelf affirmed or denied.

Thus, in the propoſition, a triangle is half of a parallelogram, if the baſes and altitudes of the two be equal; the latter part is the *hypotheſis*, if the baſes, &c and the former the theſis, a triangle is half a parallelogram.

In ſtrict logic, we are never to paſs from the *hypotheſis* to the theſis: that is, the principle ſuppoſed muſt be proved to be true, before we require the conſequence to be allowed.

HYPOTHESIS, in *Phyſics*, &c. denotes a kind of ſyſtem laid down from our own imagination, whereby to account for ſome phenomenon or appearance of nature.

Thus we have *hypotheſis* to account for the TIDES, for GRAVITY, for MAGNETISM, for the DELUGE, &c.

The real and ſcientific cauſes of natural things generally lie very deep: obſervation and experiment, the proper means of arriving at them, are in moſt caſes extremely ſlow; and the human mind is very impatient: hence we are frequently driven to feign or invent ſomething that may ſeem like the cauſe, and which is calculated to anſwer the ſeveral phenomena, ſo that it may poſſibly be the true cauſe.

Philoſophers are divided as to the uſe of ſuch fictions or *hypotheſes*, which are much leſs current now than they were formerly. The lateſt and beſt writers are for excluding *hypotheſes*, and ſtanding wholly on obſervation and experiment.

Whatever is not deduced from phenomena, ſays ſir Iſaac Newton, is an *hypotheſis*; and *hypotheſes*, whether metaphyſical or phyſical, or mechanical, or of occult qualities, have no place in experimental philoſophy. Phil. Nat. Prin. Math. in Calce.

The Carteſians take upon them to ſuppoſe what affections in the primary particles of matter they pleaſe; juſt

what figures, what magnitudes, what motions, and what ſituations, they find for their purpoſe. They alſo feign certain unſeen, unknown ſtuffs, and endue them with the moſt arbitrary properties; give them a ſubtility which enables them to pervade the pores of all bodies, and make them agitated with the moſt unaccountable motions. But is not this to ſet aſide the real conſtitution of things, and to ſubſtitute dreams in their place? Truth is ſcarcely attainable even by the ſureſt obſervations; and will fanciful conjectures ever come at it? They who found their ſpeculations on *hypotheſes*, even though they argue from them regularly, according to the ſtricteſt laws of mechanics, may be ſaid to compoſe an elegant and artful fable; but it is ſtill only a fable. Cotes in Præfat. ad Newton. Princip.

HYPOTHESIS is more particularly applied, in *Aſtronomy*, to the ſeveral ſyſtems of the heavens; or the divers manners wherein different aſtronomers have ſuppoſed the heavenly bodies to be ranged, moved, &c.

The principal *hypotheſes* are the Ptolemaic, Copernican, and Tychonic.

The Copernican is now become ſo current, and is ſo well warranted by obſervation, that the retainers thereto hold it injurious to call it an *hypotheſis*.

HYPOTHETICAL *propoſition* and *ſyllogiſm*. See CONDITIONAL.

HYPOTRACHELION, from ὑπὸ, *under*, and τραχηλος, *neck*, in *Anatomy*, denotes the lower part of the NECK.

HYPOTRACHELION, in *Architecture*, is uſed for a little frieze in the Tuſcan and Doric capital, between the aſtragal and annulets; called alſo the *echerin* and *gorgerin*.

The word is alſo applied by ſome authors, in a more general ſenſe, to the neck of any column; or that part of the capital thereof below the aſtragal.

HYPOTYPOSIS, or *Imagery*, Τυπωσις, formed of the verb ὑποτυπωω, *per figuram demonſtro, I ſhow, repreſent, or make any thing be ſeen*; of ὑπο, *under*, and τυπος, *type, image, reſemblance*, in *Rhetoric*, a figure whereby a thing is deſcribed or painted in ſuch ſtrong and bright colours, that it does not ſeem to be read, or heard, but actually ſeen, or preſented before the eyes.

Such is that elegant one of Cicero, wherein he paints the barbarity of Verres: *Iſta inflammatus furore & furore, in forum venit. Arrident omnes; lets ex ore crudelitas emanabat. Expectabant omnes quo tandem progreſſurus, aut quidnam actorus eſſet; cum repente hominem rapit, atque in ſeo multis nudavit ac dedecori, & virgas expedire juber. Clamabat ille miſer ſe civem eſſe Romanum*, &c. Such is alſo the picture which he has drawn of Cataline, conſiſting of an unaccountable mixture of contrary qualities. Pro Cael. c. 5.

The *hypotypoſis* is frequently uſed by the poets, and particularly Virgil, who abounds in paintings.

This figure is peculiarly ſuited for drawing characters, and often affords the fineſt ornaments in poetry and hiſtory, as well as oratory. It is alſo adapted to move and intereſt different paſſions, according to the nature of the ſubject, and the artful management of the ſpeaker.

HYPOXIS, in *Botany*, a genus of the *hexandria monogynia* claſs: the corolla is permanent, and divided into ſix ſegments; the capſule is narrow at the baſe; and the calyx is a double-valved glume.

HYPOZOMA, in *Anatomy*, a name given to ſuch membranes as ſeparate two cavities.

In this ſenſe the mediaſtinum is an *hypozoma*.

HYPSILOGLOSSUS, in *Anatomy*, the ſame with *baſioſyſſus*. See alſo HYOGLOSSUS.

HYPSILOIDES, in *Anatomy*. See HYOIDES.

HYPSISTARII, Ὑψιστάριανοι, *Celſiani*, formed from ὑψιστος, *higheſt*, a ſect of heretics in the fourth century; thus called from the profeſſion they made of worſhipping the moſt High God.

The doctrine of the *Hypſiſtarians* was an aſſemblage of Paganiſm, Judaiſm, and Chriſtianity. They adored the moſt High God with the Chriſtians; but they alſo revered fire and lamps with the Heathens; and obſerved the ſabbath, and the diſtinction of clean and unclean things with the Jews.

The *Hypſiſtarii* bore a near reſemblance to the EUCHITES, or MASSALIANS.

HYSSOP, in *Botany*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the empalement of the flower is cylindrical and permanent; the flower is of one petal of the grinning kind, with a narrow cylindrical tube; the chaps are inclining, the upper lip is ſhort, plain, roundiſh, erect, and indented at the top; the lower lip is trifid; it has four ſtamina, which ſtand apart, two of which are longer than the petal, and the other two ſhorter; and four germina, which afterwards become ſo many oval ſeeds ſitting in the empalement. Miller enumerates five ſpecies. The name *hyſſop* is derived from the Hebrew אזוב, ſignifying *a holy herb*, or for purifying holy places; though it is generally thought that the *hyſſop* of ſcripture is our winter ſavory, which is moſt uſed in Eaſtern countries for outward waſhings or purification.

The ſeveral ſpecies of *hyſſop*, when not in flower, may be known by their long narrow leaves, and their peculiar agreeable ſmell.

All the ſorts of this plant, the common as well as the more ſcarce, are propagated by ſeeds or by cuttings. The ſeeds muſt be ſown in March, on beds of a light ſandy ſoil, and when the plants are come up, they muſt be tranſplanted to the place where they are to remain, at the diſtance of a foot aſunder every way; or if they are intended to remain many years, they ſhould be ſet at two feet diſtance, for they grow quick, and ſpread very much. They thrive beſt on a poor dry ſoil, and will bear the ſeverities of winter much better on ſuch a ſoil than on a richer. When they are to be propagated from cuttings, it is to be done in April or May, in a border where they may be defended from the violent heat of the ſun, and being frequently watered, they will take root in two months, after which they may be tranſplanted to the places where they are to remain, managing them as the ſeedling plants.

The common *hyſſop* of the ſhops with blue ſpikes, is of a detergent cleanſing quality, and chiefly uſed as an attenuant, corroborant, and expectorant, in diſeaſes of the breaſt and lungs. In theſe caſes, infuſions of the leaves, which are not unpalatable, may be ſweetened with honey or ſugar, and drank as tea. It is a ſtanding ingredient in pectoral apozems. There are alſo a ſyrup and a ſimple diſtilled water from it, uſed in the ſhops. The leaves give out their active matter both to water and rectified ſpirit; the watery infuſions are of a brownith or greeniſh yellow, and the ſpirituous tinctures of a blackiſh green colour. On inſpiſſating the latter, the remaining extract retains its flavour, is bitteriſh, and very warm, and diſcovers a penetrating pungency reſembling that of camphor. An eſſential oil is obtained from diſtillation of the freſh herb, which riſes to the ſurface, to the quantity of about an ounce from ſix pounds of the leaves.

It has alſo a faculty to comfort and ſtrengthen; and is prevalent againſt melancholy and phlegm.

Its tops and flowers, reduced to powder, are by ſome reſerved to ſtrew upon the colder ſalad herbs.

Hyſſop is greatly commended in caſes of bruiſes from falls, blows, &c. uſed externally by way of cataplaſm, or only a little bundle of the plant ſewed up in a linen rag, and applied to the part. Ray gives an account from Mr. Boyle, of a violent contuſion of the thigh, from a kick of a horſe, which was happily cured by this herb, boiled and applied as a cataplaſm. He tells us, the violent pain was almoſt inſtantly removed, and the very mark and blackneſs taken off in a few hours.

Among the Jews, a bunch of *hyſſop* could only be uſed to ſprinkle the door-poſts and threſholds of their houſes with the blood of the paſſover-lamb. See PASSOVER.

Hedge-HYSSOP, *gratiola*, in *Botany*, a genus of the *diandria monogynia* claſs. Its characters are theſe: the flower has a permanent empalement cut into five parts; it hath one petal of the grinning kind, cut at the top into four ſmall ſegments; it has five awl-ſhaped ſtamina, and two others which are longer, and adhere to the tube of the petal; in the centre is ſituated a conical germen, which becomes an oval capſule ending in a point, having two cells filled with ſmall ſeeds. There are three ſpecies.

Mr. Geoffroy has obſerved, that the leaves of this plant are a very ſtrong purge, and that in the dry extract, a method he is very fond of, for extracting the virtues of many medicines, a briſk purge may be prepared from the *gratiola*, which operates in a ſmall doſe, and without any diſagreeable taſte. The manner of preparing it is this: the leaves are to be infuſed in water, till they have communicated their virtue to it by the means of heat, and this liquor is to be evaporated over a balneum Mariæ to a perfect drineſs; when it leaves a dry pulveriſable extract, that operates in a doſe of eight or ten grains.

This is a very rough purgative; it often operates by vomits as well as by ſtool, and carries off a great quantity of water in dropſical caſes. It alſo deſtroys worms, and opens obſtructions of the viſcera. Its operation, however, is ſo violent as to be only fit for perſons of robuſt conſtitutions. The *gratiola* is uſually given in decoction in water or ale, half a handful being a ſufficient doſe for a very ſtrong man. Its operation is rendered more mild by being boiled in milk, and the decoction drank. It purges very well in the form of clyſters, but care muſt be taken not to give it when the bowels are in an inflamed ſtate.

Externally it is ſaid to be a vulnerary, a cataplaſm of the bruiſed herb being ſometimes applied to wounds with ſucceſs.

HYSSOP, *Mountain*. See THYMBRA.

HYSSOPIC *Art*, a name which Paracelsus gave to chemistry, considered as that art purifies metals, minerals, &c. in allusion to that text in the Psalms, "Purge me "with *hyssop*, and I shall be clean."

HYSTERA, a term used by some of the old writers in medicine to express the SECUNDINES.

HYSTERALGY, compounded of the Greek ὑστερα, *womb*, and αλγος, *pain*, in *Medicine*, a pain in the matrix or womb, occasioned by some inflammation, or other disorder therein.

HYSTERIC *affection*, or *passion*, formed of ὑστερα, *womb*; a disease in women, called also *suffocation of the womb*, and vulgarly *fits of the mother*. It is a spasmodico-convulsive affection of the nervous system, proceeding from the womb, and caused by the retention or corruption of the blood and lymph in its vessels; and more or less infesting the nervous parts of the whole body, by means of the nerves of the os sacrum, the loins, and the whole spinal marrow.

Hysteric affection is generally used by authors promiscuously with *hypochondriac affection*; the two diseases being supposed to be in reality the same. They only differ indeed in point of relation and circumstance.

The *hysteric* is properly a species or branch of the hypochondriac, peculiar to women, and supposed to arise from some disorder of the womb.

One of the symptoms, or effects of hypochondriac diseases is, convulsions, or fits, not unlike those of the epilepsy: these we call *hysteric fits*; and the disease that produces them *hysteric affection*.

It is also particularly denominated *hysteric suffocation*, from one of its principal symptoms, which is a contraction of the breast, and a difficulty of breathing.

Some women under this disorder fancy a rope tied about their necks ready to strangle them; and others think a piece of something is got into their throats, which they cannot swallow, but which stops their breath; and some will even remain a good while as if really strangled without any sense or motion. At other times the patient is affected with catchings and convulsions. Sometimes the fits come on with coldness of the extremities, yawning and stretching, lowness of spirits, oppression and anxiety. At other times the approach of the fit is foretold by the navel being drawn inwards, and feeling as if there were a ball at the lower part of the belly, which gradually rises towards the stomach, where it occasions inflation, sickness, and sometimes vomiting; and afterwards it arises into the gullet, and occasions a degree of suffocation already described, to which quick breathing, palpitation of the heart, giddiness of the head, dimness of the sight, loss of hearing, with convulsive motions of the extremities and other parts of the body, and alternate laughing and crying, costiveness, and the frequent discharge of a pale limpid urine succeed.

It is not always attended with all these symptoms, but sometimes with more, and sometimes with fewer of them, and those more or less violent.

This distemper seems to arise from congestions of blood in the abdomen, and in the viscera, situated there, which should find passage by the uterus, or the hæmorrhoidal veins, but is impeded. And as this is also the cause of the hypochondriac affections in men, it is no wonder that the generality of symptoms are the same in both, and that the method of cure must be nearly the same. It is to be observed, however, that though obstructions are the common cause of these diseases in both sexes, yet women are sometimes found afflicted with this while the menses flow properly, in due quantity, and at their regular periods. In this case, the disorder seems owing to acrid humours in the primæ viæ, exciting spasms wherever they come.

Dr. Purcel describes an *hysteric* paroxysm, as beginning with a sense of coldness creeping up the back, and afterwards spreading over the whole body; then ensues a head-ach, and sometimes a palpitation of the heart, with a fainting, from which the patient soon recovers. Sometimes after the coldness, there succeeds a remarkable heat which begins on the forementioned symptoms. Baglivi adds, that *hysteric* women feel a sense of cold in the crown of the head; and this he takes to be the chief diagnostic of the disease.

The ordinary causes of this disorder are violent passions, fear, rage, love, grief, ill news, sweet smells, &c. Women of a delicate habit, whose stomach and intestines are relaxed, and whose nervous system is extremely sensible, are most subject to *hysteric* complaints. In such persons an *hysteric* fit may be brought on by an irritation of the nerves of the stomach or intestines by wind, acrid humour, &c. A sudden suppression of the menses often occasions *hysteric* fits. As for the popular notion of malignant vapours arising from the womb, and occasioning all these symptoms, all the learned discard it, and hold men as subject to the disease as women. The real cause they affirm is in the animal spirits, and the nervous system; and the affection does not differ from the hypochondriac.

For the cure: as many of the symptoms are convulsive, antispasmodics are indicated. The best of these are musk, opium, and castor. Opium, when it disagrees with the stomach, may be applied externally, or given in clysters; and it has often been found serviceable in removing those periodical head-achs to which *hysteric* and hypochondriac patients are subject. See *Hysterica* CAUSA. Castor has in some cases been found to procure sleep, where opium failed; and, therefore, Dr. Whytt advises to join them together: he likewise recommends the antihysteric plaster to be applied to the abdomen.

In the time of the fit, when the sensation of strangulation is violent, or there are convulsive motions or faintings, the scetid and volatile medicines serve to recover the patient: such are spirit of hartshorn; asa fœtida, oil of amber, tincture of castor, and the volatile salts held to the nose, or taken internally, as also the burning of feathers, horn, or leather, or any other substance, which has a very disagreeable smell while in the fire; rubbing the hands and feet, is also of great service, and some recommend the pulling off of the hairs singly, and other methods, which give pain, to bring the patients to themselves. Hot bricks may also be applied to the soles of the feet, and the legs, arms, and belly, may be strongly rubbed with a warm cloth. But the best application is to put the feet and legs into warm water. This is peculiarly proper, when the fits precede the flow of the menses. Some have advised to bleed the patient during the fit: this may be proper, if the habit be plethoric, and the pulse full; but in weak and delicate constitutions, or where the disease has been of long standing, or arises from inanition, it is not safe. In case of costiveness, a laxative clyster, with asa fœtida, should be administered; and as soon as the patient can swallow, two table spoonfuls of a solution of asa fœtida, or of some cordial julep, may be given.

These are the methods to be used in the time of the fit; but when the patient is restored from that, the same method is to be used as in the hypochondriac passion; only that, in this case, a little castor is to be added to the saline and cinnabarine medicines. After this, care is to be taken to restore the menses to their proper order, if the patient be at a time of life when they ought to flow; but if that period is past, the evacuation must be, in some measure, supplied by bleeding in the foot, and repeating this every year at the spring and fall, and with this some doses of a gentle purge, with a proper regimen. Vomits are always found hurtful in these cases, unless the stomach be loaded with phlegm, and when violent, are dangerous in the highest degree. Strong purges are also liable to the same objections, and are never to be meddled with; but if there be a tendency to costiveness, it must be removed either by diet, or by taking an opening pill, as often as necessary. All hot medicines are also prejudicial, and the common uterine elixirs, with the distilled oils, and volatile salts, are liable to the same objections. Some give the common terrestrial alkalies and absorbents, but they give no relief in these cases; because an acid either is no cause, or, at the utmost, is not the essential cause of these disorders.

Steel medicines are also given by many; but they are to be used with great caution; and, in general, they seldom do any good, but very often a great deal of harm. As there are, however, some cases of this kind in which they excel all other medicines, it is always proper to give them a fair trial, under the proper regulations.

The most proper medicines are those which strengthen the alimentary canal, and the whole nervous system; as the preparations of iron, the Peruvian bark, and other bitters. Twenty drops of the elixir of vitriol in a cup of the infusion of the bark, may be taken twice or thrice a day. The bark and iron may be likewise taken in substance, in considerable doses.

The common chalybeate waters often prove of more service in this disease than all the medicines in the world; but they are to be taken with the proper cautions, and a due regimen. It is necessary to bleed in the foot before entering on a course of them, and then they are to be drank in moderate quantities, and always a little warmed, using a moderate exercise during the time of drinking them. See MINERAL-*waters*.

A course of milk and vegetable diet will often perform a cure. The most proper drink is water, with a small quantity of spirits. A cool dry air is the best. Cold bathing, and every thing that braces the nerves, and invigorates the system, is beneficial; but lying too long in bed, or whatever relaxes the body, is injurious. The

mind

mind ſhould be kept conſtantly eaſy and chearful *Hyſteric* patients are often afflicted with cramps, for the relief of which the moſt efficacious medicines are opium, bliſtering plaiſters, and warm bathing and fomentations. In milder caſes, immerſing the feet and legs in warm water, or applying a bliſtering plaſter to the part affected, has removed the complaint. Patients, whoſe nerves are uncommonly delicate and ſenſible, and for whom the bliſtering plaſter is not ſo proper, may attempt the cure by opiates, muſk, camphor, and the warm bath. Cramps in the legs have been ſometimes removed by tight bandages; and convulſions ariſing from a flatulent diſtention of the inteſtines, or from ſpaſms beginning in them, may be diminiſhed or cured by making a ſtrong compreſſion upon the abdomen with a broad belt. See CRAMP. Buchan's Dom. Med. p. 490.

HYSTERIC *colic*. See COLIC.

HYSTERICS, or HYSTERIC *medicines*, are remedies proper to remove *hyſteric* affections; and to remedy diſorders of the womb.

There are divers ſpecies of *hyſterics*: ſome evacuate or cleanſe the womb, by expelling any impurities lodged therein; others tend to ſtop immoderate fluxes thereof, and others ſtrengthen the tone of the part.

According to Dr. Quincy, *hyſteric* affections ariſe either from too titillating, or too uneaſy ſenſations; the former proceed from that irritation of the nerves, which the make and ſecretion of thoſe parts have naturally ſubjected them to, and which, in ſome ſorts of conſtitutions, ariſe to that degree, as to draw the whole ſyſtem into diſorder, and occaſion a ſurpriſing variety of ſymptoms; e. g. ſeveral ſorts of convulſions and ſpecies of madneſs; which therefore are by ſome termed *furores uterini*.

Theſe diſorders are moſt effectually allayed by ſuch things as are in a manner the reverſe of cordials, and are both in ſmell and taſte very offenſive and diſagreeable: they ſeem to anſwer this end by ſuffocating, as it were, the ſpirits, and damping their inordinate ſallies, ſo that ſuch ſtimulation ceaſes, and the fibres return to their natural tone and motions; for, as what is grateful to the ſenſes gives an inexpreſſible emotion to the fine nervous filaments, ſo does what is fœtid and diſagreeable quite deſtroy that emotion and deaden it; and as the former kind conſiſt chiefly of fine ſubtile volatile parts, by which, as before explained under CEPHALICS, they are fitter to enter the nerves; ſo theſe are generally of a clammy viſcous contexture, and therefore the fitter to envelope and entangle that ſubtile juice, whereby its motion is much retarded.

HYSTERICUS *lapis*, in *Natural Hiſtory*, a name given to an American ſtone, called alſo *lapis uterinus*, famous for its virtues againſt diſorders of the womb, externally applied. It is black, and capable of a fine poliſh.

HYSTERICUS *clavus*. See CLAVUS.

HYSTEROCELE, formed of ὑστερα, *womb*, and κηλη, *tumor*, in *Medicine*, an HERNIA cauſed by the uterus paſſing through the peritonæum.

HYSTEROLITHUS, formed of ὑστερα, *womb*, and λιθος, *ſtone*, or CUNNOLITHUS, in *Natural Hiſtory*, a ſtone thus called, from its reſemblance to the external parts of generation of the female ſex. It is very hard, of a grey or blackiſh brown colour, about the ſize of half a walnut which it reſembles, being convex, and ſomewhat ſmooth on one ſide, and on the other ſide reſembling the labia pudendi. This is a ſpecies of the HELMINTHOLITHUS, in the Linnæan ſyſtem. Theſe ſtones are found in great abundance near the caſtle of Braubach, upon the Rhine, on the confines of the landgravate of Heſſe.

HYSTEROLOGY, Ὑστερολογια, ſignifying a *diſcourſe inverted*, in *Rhetoric*, a ſpecies of HYPERBATON, or a vicious manner of ſpeaking, wherein the natural order of things is inverted; called alſo by the Greeks ὑστερον προτερον; q. d. putting the firſt thing where the laſt ſhould be.

Thus Terence uſes *valet & vivit*, for *vivit & valet*. And Virgil *moriamur & in media arma ruamus*, for *in media arma ruamus & moriamur*. Quintilian expoſes this fault, lib. xi. cap. 2. where he ſays, *quædam —— turpiter convertuntur, ut ſi peperiſſe narres, deinde* conceperiſſe; *in quibus, ſi id quod poſterius eſt dixeris de priore tacere optimum eſt*.

HYSTERON-PROTERON, Ὑστερον προτερον. See HYSTEROLOGY.

HYSTEROPHORUS, in *Botany*, the name of a genus of plants, deſcribed by Vaillant in the Acta Germanica, the characters of which are the ſame with thoſe of the common PARTHENIUM.

HYSTEROPOTMI, Ὑστεροποτμοι, in *Antiquity*, the ſame with DEUTEROPOTMI.

HYSTEROTOMIA, Ὑστεροτομια, formed of ὑστερα, *womb*, and τεμνω, *I diſſect*, in *Anatomy*, an anatomical diſſection of the uterus, or WOMB.

HYSTEROTOMOTOCY, Ὑστεροτομοτοκια, in *Surgery*, an operation more uſually called the CÆSARIAN *ſection*.

HYSTRIX. See PORCUPINE.

HYTH, or HITH, a port, wharf, or little haven, to embark or land wares at. Such is *Queen-hith*, &c.

I.

I, The ninth letter of the Engliſh alphabet: it is both a vowel and a conſonant; agreeable to which two different powers, it has two different forms; though, ſince the vowel and conſonant differ in their form, as well as ſound, they may, as Dr. Johnſon obſerves, be more properly accounted two letters.

The Hebrews called the *j* conſonant *jod*, יוד, from יד, *hand* and *ſpace*; becauſe it is ſuppoſed to repreſent the hand clenched, ſo as to leave the ſpace underneath void. With them it was pronounced as the conſonant *y*, as it ſtill is among the Germans, and ſome other people. The Greeks had no *j* conſonant, and for that reaſon uſed their vowel *i* inſtead of it, as coming the neareſt in ſound. The letter *i* was uſed as a conſonant among the Latins.

In Engliſh *j* conſonant has invariably the ſame ſound with that of *g* in *giant*; and ſerves to mollify that of the vowels; as in *Jew, jeſt, jovial*. *I* vowel varies in its ſound: in ſome words it is long, as *fine, thine*, &c. In others ſhort, as *fin, thin*. Prefixed to *e*, it makes a diphthong of the ſame ſound with the ſoft *i*, or double *ee*, as in *field, yield*, except in *friend*, which is pronounced *frend*. Subjoined to *a* or *e*, it makes them long, as *fail, neigh*; and to *o* makes a mingled ſound, which approaches more nearly to the true notion of a diphthong, or ſound compoſed of the ſounds of two vowels, than any other combination of vowels, in the Engliſh language, as *oil, coin*. The ſound of *i* before another *i*, and at the end of a word, is always expreſſed by *y*. Johnſon.

The vowel *i*, according to Plato, is proper for expreſſing fine and delicate, but humble things: on which account that verſe in Virgil,

Accipiunt inimicum imbrem, rimaſque fatiſcunt,

which abounds in *i*'s, is generally admired.

The vowel *i* was the only vowel which the Romans did not mark with the daſh of a pen, to ſhew when it was long; inſtead of which, to denote it long, they uſed to make it bigger than ordinary, as in *Piſo, Vivus*, &c. According to Lipſius, they often repeated it when it was to be long, as in *diii*. They ſometimes alſo denoted the length of this letter by adding *e* to it, and turning it into a diphthong, as *dipei* for *divi*, *omnеis* for *omnis*, &c.

I, in *Logic*, denotes a particular affirmative propoſition.

I was anciently a numeral letter, and ſignified a hundred, according to the verſe.

I. C. *cumpar ſcit, & centum ſignificabit.*

I, in the ordinary way of numbering, ſignifies one; and when repeated, it ſignifies as many units as it is repeated times. When put before a higher numeral, it ſubtracts itſelf, as IV, IX, &c. but when ſet after it, it is added as often as repeated; as VI, XI, VIII, XIII, &c.

In abbreviatures and ciphers, *I* frequently repreſents the whole word Jeſus, whereof it is the firſt letter.

I, in the *French Coinage*, characteriſes the money of Limoges.

JABAJAHITES, a ſect among the muſſulmen, who, according to Ricaut, teach, that God is not perfectly wiſe; that his knowledge does not extend to every thing; and that time and experience have furniſhed him with the knowledge of many things whereof he was before ignorant. Thus, ſay they, not being appriſed from all eternity of every event that ſhall happen in the world, he is now obliged to govern it according to the chance and occurrence of thoſe events.

JABIRU, in *Ornithology*, the name of a large water-bird approaching to the crane-kind, and called by ſome the *negro*. It is larger than our ſwan, its neck is as thick as a man's arm, and its head very large; its beak is ſtraight, eleven fingers breadth long, pointed and a little hooked at the end; its legs are two feet long, and thick, and as it were, ſcaly; it is all over on the body white, as the ſwan or gooſe; its neck is naked, and for a long way below the head is covered, as is alſo the head, with a tough black ſkin: it is poſſible, however, that there naturally may be feathers on this part; but that only dead birds having been ſeen of this ſpecies, the feathers may have fallen off; its tail is broad and ſhort. Margrave.

JARIRUGUACU, in *Ornithology*, the name of a Braſilian bird, called by others nanduapoa, and by the Dutch SCURVOGEL.

JABOTAPITA, in *Botany*. See OCHNA.

JABOTI, in *Zoology*, the name of a remarkable ſpecies of tortoiſe found in America. The ſhell of this ſpecies is black, and has many hexangular figures marked upon it; the head and legs are brown, variegated with ſpots of a duſky greeniſh hue. The liver of this ſpecies is accounted a very delicate food.

JACA, in *Natural Hiſtory*, the name of a kind of nut, very common in China, which is reckoned the largeſt of all yet known. It is produced from the trunk of the tree, as if the branches, however large and ſtrong, were not able to bear it; its ſhell is ſo ſtrong, that there is occaſion for an ax or hatchet to open it; and within are innumerable cells or veſicles containing a pulp of a yellow colour, which ſurrounds a kernel like the cheſnut, that is exceeding ſweet when ripe.

JACAMACIRI, in *Ornithology*, the name of a very remarkable Braſilian bird, approaching to the nature of the woodpecker, and having feet of the ſame ſort with the birds of that genus, the toes ſtanding two before and two behind; it is of the ſize of a lark; its feet are yellow; its head, back, and wings, are all of a very lively green, variegated with yellow and red, and its breaſt and belly of a duſky yellow; it is a very ſplendid and beautiful bird, its colours glowing very brightly in the ſun. Margrave.

JACANA, in *Ornithology*, the name of a Braſilian bird, a ſpecies of moor-hen. It is a very elegant and beautiful kind; it is of the ſize of a pigeon, but its legs are much longer, and are of a greeniſh yellow, and all its toes, eſpecially the hinder one, are of a very remarkable length; its tail is ſhort, its colour on the back, belly, and wings, is a mixt green and black; its neck and breaſt are of the changeable colours they are in the peacock, and in ſome pigeons; its head is ſmall, and is covered with a membrane of the colour of the oriental turquoiſe ſtone; the beak is ſhaped like that of the gallinaceous kind, and is about a finger's breadth long, and is partly of a greeniſh yellow, partly of a very elegant red: it is very common in watery places in Braſil, and is eaten, but not eſteemed a fine fowl. Margrave.

JACAPU, in *Ornithology*, the name of a bird of the merula or blackbird-kind, and of the ſize and ſhape of the common blackbird; its upper part is all of a deep black, except that the tips of the feathers on the rump are ſlightly greyiſh; its breaſt is of a very fine red, and its tail long and like that of the common blackbird; as are alſo its beak and feet. Ray.

JACARE, in *Zoology*, the name of an animal found in the Braſils, and very little differing from the crocodile of the other parts of the world, if at all ſpecifically, which Mr. Ray doubts. It has no tongue, but only a ſort of membrane, which reſembles the ſhape of one, and which it cannot lift up or move; its eyes are large, round, clear, and very bright, the iris blue, and the pupil of a fine black; the fore-legs are very ſlender and weak; the hinder ones longer, and more robuſt; the fore-feet have each five toes; three in the middle, which are long, and armed with very ſharp claws; and two at the ſides, which have none; the hinder feet have only four toes each;

one of which only on each foot wants a claw, and is the outer one; the farther half of the tail has a ſtrong erect fin upon it, which is of great uſe to the creature when in the water, ſerving as the fins of fiſhes to aſſiſt it in ſwimming. Ray.

JACARINI, in *Ornithology*, the name of a Braſilian bird of the goldfinch kind, and of the ſize of our common goldfinch. Its beak is thick and grey, as are alſo its legs and feet; it is all over of a fine ſhining black, like poliſhed ſteel; its wings are white underneath. Margrave.

JACCHAGOGI, Ἰακχαγωγοὶ, in *Antiquity*, thoſe who carried the ſtatue of the hero Jacchus in proceſſion, at the celebration of the Athenian feſtival called ELEUSINIA. They had their heads crowned with myrtle.

JACEA, in *Botany*. See CENTAURY.

JACINTH, in *Botany*. See HYACINTH.

JACK, in *Falconry*, ſignifies the male of birds of ſport. See FALCON and HAWK.

JACK, in *Ichthyology*. See PIKE.

JACK, in *Mechanics*, is an inſtrument in common uſe for raiſing heavy timber, or very great weights of any kind. See *Tab.* IV. *Mechanics*, *fig.* 25.

But as the wheel-work of this engine is incloſed in the ſtrong piece of timber C B, the inſide of it is repreſented in *fig.* 46. where the rack A B muſt be ſuppoſed at leaſt four times as long in proportion to the wheel Q, as the figure repreſents it; and the teeth, which will be then four times more in number, to be contained about three in an inch. Then if the handle H P be ſeven inches long, five turns of it, i. e. 5 times 22 inches, or 110 inches, will be the velocity of the power, whilſt the weight raiſed by the claw A, or depreſſed by the claw B, moves one inch: for as the pinion of the handle has but four leaves, and the wheel Q twenty teeth, there muſt be five revolutions of the handle to turn the wheel once round, whoſe three-leaved pinion R will, in that revolution, juſt move the rack three teeth, or one inch. This might have been alſo known without ſcering, or even knowing the number of the teeth of the wheel and pinions, by meaſuring a revolution of the handle in *fig.* 25. and comparing the ſpace gone through by it with the ſpace gone through by the end A or B. This machine is ſometimes open behind from the bottom almoſt up to the wheel Q, to let the lower claw, which in that caſe is turned up as at B, draw up any weight. When the weight is drawn, or paſhed ſufficiently high, it is kept from going back by hanging the end of the hook S, fixed to a ſtaple, over the curved part of the handle at b.

JACK is alſo the name of a well known engine uſed for turning a ſpit: the weight is the power applied; the friction of the parts, and the weight with which the ſpit is charged, are the force to be overcome; and a ſteady uniform motion, is maintained by means of the FLY. See the conſtruction of this engine more particularly explained and illuſtrated by a figure, under the article MECHANICAL *powers*.

JACK, *Smoke*, is an engine uſed for the ſame purpoſe with the common *jack*, and is ſo called from its being moved by means of the ſmoke or rarefied air, aſcending the chimney, and ſtriking againſt the tail of the horizontal wheel A B, (*fig.* 47.) which, being inclined to the horizon, is moved about the axis of the wheel, together with the endleſs ſcrew C, which turns the wheels D and E; and E carries the chain F, which turns the ſpit. The wheel A B ſhould be placed in the narrow part of the chimney, where the motion of the ſmoke is ſwifteſt, and then the greateſt part of it muſt ſtrike upon the ſails. The force of this machine depends on the draught of the chimney, and the vehemence of the fire.

JACK, in a *Ship*, is a fort of flag or colours, diſplayed from a maſt erected on the outer end of a ſhip's bowſprit. In the Britiſh navy the *jack* is nothing more than a ſmall union FLAG, compoſed of the interſection of the red and white croſſes: but in merchant-ſhips this union is bordered with a red field. *See Tab. of Flags* and *Ship. fig.* 1. N° 146.

JACK *in a box*, *Hernandia*, in *Botany*, a genus of the *monoecia triandria* claſs. Its characters are theſe; it has male and female flowers on the ſame plant; the male flowers have a partial involucrum, compoſed of four oval ſmall leaves, which incloſe three flowers, each of which has a proper bell-ſhaped empalement of one leaf; the petal is funnel-ſhaped, cut into ſix parts at the brim; and it has three ſhort ſtamina inſerted in the the empalement; the female flowers are ſhaped like the male, but want ſtamina, and have a roundiſh germen; the empalement becomes a large ſwollen, oblong fruit, perforated at each end, incloſing one hard globular nut. There is one ſpecies, according to Miller, but Linnæus reckons two, growing naturally in the Weſt Indies.

As the fruit of this plant is perforated, and the nut within becomes hard; ſo when the wind blows through the fruit, it makes a whiſtling noiſe, to be heard at ſome diſtance. It is propagated among us in the gardens of the curious, by only ſowing the ſeed in a hot-bed in the ſpring. They muſt be conſtantly kept in the hot ſtove.

JACK *by the hedge*, in *Botany*. See *Hedge* MUSTARD, and *Dame's* VIOLET.

JACK-*daw*, in *Ornithology*, a ſpecies of the CORVUS or CROW; being the *corvus monedula* of Linnæus. The head of this bird is large in proportion to its body; the ſides are white; the forehead is black; the hind-part of the head a fine light grey; the breaſt and belly of a duſky hue, inclining to aſh-colour; the reſt of the plumage is black, but duly gloſſed with blue; the feet and bill black; the claws very ſtrong and hooked. This is a docile and loquacious bird. *Jack-daws* breed in ſteeples, old caſtles, and high rocks, laying five or ſix eggs: they feed on inſects, grain, and ſeeds. Pennant.

This bird is very miſchievous to the farmer and gardener, and is of ſuch a thieviſh diſpoſition, that he will carry away much more than he can make any uſe of. There is a method of deſtroying this bird by a particular ſort of ſpringe, which is much practiſed in ſome parts of England, and is ſo uſeful, that it ought to be made univerſal. The method is this: a ſtake of about five feet long is to be driven firmly into the ground, and made ſo faſt that it cannot move, and ſo ſharp pointed at the top, that the *jack-daw* cannot reſt upon it. Within a foot of the top there muſt be a hole bored through it, of three quarters of an inch in diameter; through this hole is to be put a ſtick of about eight inches long, then a horſe-hair ſpringe or nooſe is to be faſtened to a thin hazel-wand, and is brought up to the place where the ſhort ſtick is placed, and carried with it through the hole; the remainder being left open under that ſtick. The other end of the hazel-rod is to be put through a hole in the ſtake near the ground, and faſtened there; the ſtake is to be planted among the *jack-daws* food, and he will naturally be led to ſettle on it; but finding the point too ſharp, he will deſcend to the little croſs ſtick; this will ſink with its weight, and the ſpringe will receive his leg, and hold him faſt.

JACK-*arch*, in *Architecture*, is an arch one brick thick.

JACK-*head*, in *Hydraulics*, a part ſometimes annexed to the *forcing*-PUMP.

JACK-*Ketch* is a name given by the populace to the common hangman.

JACK-*in-a-lantern*. See IGNIS *fatuus*.

JACK-*ſnipe*, in *Ornithology*, the *ſcolopax gallinula* of Linnæus, is about half the ſize of the common ſnipe, and therefore, ſometimes called the *half-snipe*. The bill of this bird is black, tinged with ruſſet; the iris of the eye is a yellow ſtreak; the neck is variegated with white, brown, and pale red; the ſcapular feathers are narrow, very long, and brown, bordered with yellow; the rump is of a gloſſy bluiſh purple; the belly and vent white; the tail brown, edged with tawny, and conſiſting of twelve pointed feathers; the legs are of a cineraous green. The haunts and food of this ſpecies are the ſame with thoſe of the common ſnipe; but it is much leſs frequent, and will not riſe till it is almoſt trod upon. Its motion is ſluggiſh, and flight never diſtant. Pennant.

JACK *trumbaſſum*, in our *Old Writers*, a kind of defenſive coat-armour, worn by horſemen in war, not made of ſolid iron, but of many plates faſtened together, which ſome perſons by tenure were bound to find upon occaſion.

JACK is uſed alſo for a horſe or wooden frame to [illegible] ber upon; for an inſtrument to pull off a pair [illegible]; for a great leathern pitcher to carry drink in; [illegible] bowl that ſerves as a mark at the exerciſe of [illegible] and for a young pike.

JACKALL, in *Zoology*, the name of a creature [illegible] dog-kind, the CANIS *aureus* of Linnæus, called [illegible] thous *lupus aureus*, the *gold-coloured wolf*, and by [illegible] deen Greeks *ſpatlakis*. It is ſmaller than the [illegible], and of a very beautiful yellow colour. Theſe animals are always ſeen in large flocks together, not unfrequently to the number of two hundred in a ſtock; and when the hounds in full cry from evening till morning. It is a very thieviſh animal, and will ſteal peoples things away while they ſleep, not ſparing ſuch as can be of no uſe to it, as their hats, ſhoes, or the like. There is ſcarce an animal which the *jackall* will leave unmoleſted: in want of living prey, it will feed on roots, fruits, and carrion; greedily diſinter the dead, and feed on the putrid corpſes. Their howls in the purſuit of caravans and armies are dreadful. It is a very common creature in Calicut, and is heard barking all night long. They may be ſometimes robbed of their prey by the lion; but the vulgar notion of their attendance on that animal is fabulous. The *jackall* is vulgarly called the lion's provider, from

an opinion, that it rouzes the prey for it; but this is merely an accidental benefit, which the lion derives from its terrifying cries, by which it rouzes almost every creature in the foreſt. Shaw's Travels, p. 247.

JACOBÆA, in *Botany*. See RAGWORT, and GROUNDSEL.

JACOBÆOIDES, in *Botany*. See GOLDEN *rod*.

JACOB's *ladder*, in *Botany*. See *Greek* VALERIAN.

JACOB's-*ſtaff*, a mathematical inſtrument for taking heights and diſtances; the ſame with the CROSS-STAFF.

JACOBINE, the name of a particular ſpecies of pigeon, called by Moore the *columba cypria cucullata*. It is generally called the jack, for ſhortneſs. It is, when genuine and of the true breed, the ſmalleſt of all pigeons. It has a range of feathers inverted quite over the hinder part of its head, and reaching down on each ſide of the neck to the ſhoulders of the wings, which forms a kind of friars hood, from whence the bird has its name. This ſpecies has alſo a ſhort bill, and a pearly eye. The colour is various in the feathers; there are reds, yellows, blues, blacks, and mottles; but whatever is the general colour, the head, tail, and flights, are white. Some pigeons of this ſpecies are feather-legged, others are not.

JACOBINS, a name given in France to the religious who follow the rule of St. Dominic, on account of their principal convent, which is near the gate of St. James, in Latin Jacobus, at Paris; and which, before they came poſſeſſed of it in the year 1218, was an hoſpital of pilgrims, dedicated to the ſaid ſaint. See DOMINICANS.

Others maintain, that they have been called *Jacobins* ever ſince they were eſtabliſhed in Italy, becauſe they pretended to imitate the lives of the apoſtles.

They are alſo called *friers preachers*, or *preaching friers*.

JACOBITES, a ſect of hereties, who were anciently a branch of the Eutychians, and are ſtill ſubſiſting in the Levant.

They were ſo called from Jacobus, James, of Syria, called Baradæus, who was one of the heads of the Monophyſites, or ſectaries who owned but one nature in Jeſus Chriſt.

This poor monk revived the cauſe of the Monophyſites by his activity and diligence; and when he died biſhop of Edeſſa, A. D. 588, he left his ſect in a moſt flouriſhing ſtate in Syria, Meſopotamia, Armenia, Egypt, Nubia, Abyſſinia, and other countries.

The Monophyſites were a ſect of vaſt extent, comprehending the Armenians, Copts, and Abyſſinians; but thoſe among them who are properly *Jacobites*, were but few; and among thoſe, too, there is now a diviſion, ſome being Romaniſed, and others perfectly averſe to the Romiſh church: each of which parties have their ſeveral patriarchs.

As to their faith, all the MONOPHYSITES, both Jacobites and others, follow the doctrine of Dioſcorus touching the unity of nature and perſon in Jeſus Chriſt.

JACOBITES, in England, is a term of reproach beſtowed on ſuch perſons as diſallow of the revolution by king William, and ſtill aſſert the rights, and adhere to the intereſts of the abdicated king James, and his line.

JACOBUS, a gold coin, worth twenty-five ſhillings; ſo called from king James the Firſt of England, in whoſe reign it was ſtruck. We uſually diſtinguiſh two kinds of *Jacobus*, the *old* and the *new*; the former valued at twenty-five ſhillings, weighing 8ſt penny-weights ten grains; the latter, called alſo Carolus, valued at twenty-three ſhillings; in weight five penny-weights twenty grains.

JACITATION *of marriage*. See MARRIAGE.

JACQUINIA, in *Botany*, a genus of the *pentandria monogynia* claſs; the characters of which are, that the corolla is divided into ten ſegments; the ſtamina are inſerted in the receptacle; and the fruit is a ſingle-ſeeded berry.

JACULATOR, or *ſpotted-fiſh*, in *Ichthyology*, is a ſpecies of the *ſcomber* in the Linnæan ſyſtem, or the *ſcomber roſtratus*, with an entire tail, nine ſpines in the dorſal fin, and a brown circular ſpot, reſembling an eye, and cylindric ſnout. This fiſh is found in India, and derives its name from the manner in which it collects its food. For this purpoſe it frequents the ſhores and ſides of the ſea and rivers; and when it ſpies a fly on the plants, that grow in ſhallow water, it ſwims on to the diſtance of four, five, or ſix feet, and then, with a ſurpriſing dexterity, ejects out of its tubular mouth a ſingle drop of water, which never fails to ſtrike the fly into the ſea or river, where it ſoon becomes a prey. Phil. Trant. vol. liv. art. 14. and vol. lvi. art. 21. *See Tab.* II. *of Fiſh, fig.* 15.

JACULUM, in *Zoology*, the name of a ſpecies of ſerpent found in Illyrica, and ſome other places, and more uſually called ACONTIAS.

JACUPEMA, in *Ornithology*, the name of a Braſilian bird of the pheaſant-kind, nearly as large as the common European hens. Its feet are of a fine red; it is a very well taſted fowl, and is eaſily kept tame. It has its name from the noiſe it makes, which is *jacu, jacu, jacu*. Margrave.

JACUT, in the *Natural Hiſtory of the Arabians*, is generally ſuppoſed to be the name of the ruby only; and it is owing to this, that among the gems uſed by the Arabian phyſicians in medicine, the ruby is ſuppoſed to have been moſt of all in eſteem, as the name *jacut* oftener occurs in their writings than that of any other of the gems.

JACUT-AGA, is the name of an officer in the court of the grand ſeignior. He is one of two eunuchs who have the care of the treaſure.

JADDESSES is the name of an inferior order of prieſts in Ceylon, who have the care of the chapels appropriated to the genii, who form a third order of gods among theſe idolaters. Theſe prieſts are applied to by the people in a time of diſeaſe or calamity, who offer a cock on their behalf to appeaſe the anger of the daemons.

JADE, a greeniſh ſtone, bordering on olive-colour, much eſteemed for its hardneſs, which exceeds that of porphyry, agate, or jaſper; and is only to be cut with diamond-duſt.

It is in great eſteem among the Turks and Poles, who adorn all their fine works with it, and eſpecially the handles of their ſabres.

This ſtone, applied to the reins, is ſaid to be a preſervative from the nephritic colic. M. Bernier tells us, that the caravans of Tibet carry it to Cachemire, and that the Gallibis prize it as highly as the diamond. The natives of South America value it on account of the virtues they attribute to it in the epilepſy, ſtone, and gravel. In a treatiſe on it, printed at Paris, it is called the *divine ſtone*. See LAPIS *divinus*, and NEPHRITIC *ſtone*.

JAGRA, a name given to a peculiar ſpecies of ſugar, prepared from the cocoa-nut.

JAGUACATI-*guau*, in *Ornithology*, the name of a Braſilian bird of the kingfiſher-kind, called by the Portugeſe *papa peixe*. It is of the ſize of a thruſh, and in ſhape much reſembles the European kingfiſher. Margrave.

JAGUARA, in *Natural Hiſtory*, the name of a Braſilian animal, accounted by Margrave a ſpecies of tyger, but differing from that creature, and approaching to the leopard in the ſhape of its variegations, which are ſo many round ſpots; it is all over of a yelloviſh colour, beautifully variegated with black ſpots differently diſpoſed; it is a very fierce animal, and as ravenous of human fleſh as of that of beaſts. Ray. See *Tab.* III. *Quadrupeds*, N° 23.

JAGUARACA, in *Ichthyology*, the name of a Braſilian fiſh in many things reſembling the ſcorpina of the Mediterranean. It is of the ſize of the freſh-water perch, and its mouth is very large, but without teeth. It is caught among the rocks, and is a very well taſted fiſh. Margrave.

JAGUARETE, in *Natural Hiſtory*, the name of a Braſilian beaſt of prey, accounted by Margrave a ſpecies of tyger, but improperly, its roundiſh ſpots arguing it of the lynx or leopard kind. It is of the ſize of a young heifer, of a yelloviſh colour, variegated with black and brown ſpots, and is a very fierce and deſtructive animal. It much reſembles the creature called jaguara but is larger; and the ſpots which in that are all round, are in this ſome round, and ſome of other figures. The Portugueſe call both by the ſame name, *onça*.

JAIL. See GAOL.

JAIL *fever*. See FEVER, and HOSPITAL *fever*.

JALAP, in *Medicine*, ſo called from the name of the country, viz. Chalapa, or Xalapa, a province in New Spain, between La Vera Cruz and Mexico, whence it is brought, the root of a ſpecies of the CONVOLVULUS, or the *convolvulus* with variable leaves, foot-ſtalks with ſingle flowers, and a tuberous root.

The mechoacan and this are reckoned of a ſpecies; and therefore as this is ſometimes called *mechoacana nigra*, that goes as often by the name of *jalapium album*.

As *jalap* does not appear to have been known to the ancients, it has its place in medicine only ſince thoſe parts of America, which produce it, have been traded to by the Europeans.

The *jalap* roots are brought over in thin tranſverſe ſlices, ſolid, hard, and heavy; of a blackiſh colour on the outſide or cortical part, and internally of a dark greyiſh, with ſeveral black circular ſtrix; the hardeſt, darkeſt coloured, and thoſe which have moſt of theſe reſinous veins, are the beſt. This root has ſcarcely any ſmell or taſte. In doſes of a ſcruple, or half a dram, it is an effectual and ſafe purgative, very rarely occaſioning any ſevere gripes or naufea. *Jalap* is an excellent purgative in dropſies and other caſes, in which ſerous humours

are

are to be evacuated. But it ſhould not be adminiſtered in acute fevers, nor to perſons of dry and hot conſtitutions; for in ſuch caſes, it is liable to the ſame miſchiefs as other acrid purgatives, and will ſometimes bring on heat and inflammations in the viſcera.

The preparations of *jalap* in uſe with us are a tincture, an extract, and a reſin. The tincture is made by digeſting three or four ounces of *jalap* in a pint of proof ſpirit. The extract is prepared by firſt drawing a tincture from the powdered root with rectified ſpirit, then boiling the reſiduum in freſh quantities of water, evaporating the decoctions till they begin to grow thick, mixing in by degrees the tincture inſpiſſated to a like thickneſs, and continuing a gentle heat till the whole is reduced to a due conſiſtence. This extract may be taken by itſelf in doſes of twelve grains, or more. *Jalap* root, digeſted in as much rectified ſpirit as will cover it to the height of about four fingers, gives out the greateſt part of the reſinous manner in which its activity reſides, and tinges the menſtruum of a yelloviſh brown colour. On inſpiſſating the filtered tincture to about one half, and adding to the remainder a proper quantity of water, the liquor becomes milky, and on ſtanding depoſits the pure reſin. This preparation, by itſelf, irritates and gripes much, without proving conſiderably purgative; but thoroughly triturated with teſtaceous or other powders, or with ſoap, or ground with almonds, or powdered gum arabic, and made into an emulſion with water, or diſſolved in rectified ſpirit, and mixed with a proper quantity of ſyrup, that the ſolution may bear being diluted with watery liquors without precipitation, it purges, in doſes of eight or ten grains, as effectually, and, for the moſt part, as mildly as the *jalap* in ſubſtance. Lewis's Mat. Med.

After all the preparations the chemiſts have invented for this root, the beſt way of giving it is in ſubſtance. Mr. Boldue, in his analyſis of it, found, that when he ſeparated its ſaline and its reſinous parts, by making extracts of it firſt with ſpirits of wine, and then with water, that the ſaline or watery extract was much larger in quantity than the other, but that it purged weakly; and that the reſinous extract, though it operated in a ſmall doſe, was yet a very rough medicine; ſo that the beſt way of uſing them was together, and that nature gave us the medicine ready prepared. Mem. Acad. Par. 1701.

However, others have obſerved, that the extracts of *jalap* appear preferable to the root in ſubſtance, not only on account of the doſe being rendered ſmaller by the rejection of the woody parts, but likewiſe as being more uniform and certain in ſtrength. Lewis.

Many fraudulent chemiſts, when *jalap* is dear, have a trick of putting ſcammony, which is of itſelf almoſt all reſin, among it, and ſometimes gamboge; by which means they can afford to ſell it cheaper than the price it can be honeſtly made for. But their moſt curious cheat is in mixing it with common black reſin; two parts of the latter to one of the former. But this may be known by putting it into rectified ſpirit, which will again diſſolve the reſin of *jalap*, but not touch the other. The virtues are the ſame with thoſe of the root, but it works rougher, becauſe all ſubſtances ſtick to the coats of the inteſtines, ſo as to occaſion much pain and uneaſineſs; for which reaſon this is corrected with ſugar, cream of tartar, or the like; by which means it is brought into the ſame ſtate as nature preſents it in the root. For ſome purpoſes, indeed, where the form is required to be ſmall, as often in adminiſtration to children, this is moſt convenient. Its doſe is from three grains to one ſcruple.

Jalap poſſeſſes a fermenting power in a conſiderable degree, and is ſaid to be uſed with this intention by brewers and diſtillers.

JALAPA, in *Botany*. See MIRABILIS.

JALEMUS, ἰαλεμος, in *Antiquity*, a kind of mournful ſong, uſed upon occaſion of death, or any other affecting accident. Hence the Greek proverbs had their original, κακιων ιαλεμου, or ψυχροτερος, i. e. *more ſad or colder than a jalemus*, οι της καλης ευρισκοντες, *worthy to be ranked among jalemuſes*. Mem. Acad. Inſcript. tom. xiii. p. 554.

JAN, or JAMB, in the language of our lead-miners in Mendip, a thick bed of ſtone, which hinders their work when they are purſuing the veins of ore.

JAMACALI, in *Ornithology*, the name of a Braſilian bird, of the ſize of a hawk; its head is ſmall, its beak a little bent downward; its head is black, its throat alſo black, but the upper part of its neck yellow; its back, breaſt, and belly, are alſo yellow; its wings are black, but have each one white ſpot; its tail alſo is black, and its legs and feet brown; it is an extremely beautiful bird, and has ſo long a tail, that it ſeems to belong to the wagtail, or motacilla kind. Margrave.

JAMAICA *pepper*. See PIMENTO.

JAMAICA *wood*. See BRAZIL.

JAMBEAUX, among our *Old Writers*, armour for the legs.

The word is French, from *jambe*, the *leg*.

IAMBIC, in *Ancient Poetry*, a kind of *verſe*, found in the Greek and Latin poets; conſiſting wholly, or at leaſt in great part, of *iambuſes*, or feet ſo called.

Iambic verſes may be conſidered, either with regard to the diverſity, or the number of their feet: under each of which heads there are diſtinct kinds, which have different names. 1. *Pure iambics* are thoſe which conſiſt entirely of *iambuſes*; as the fourth piece of Catullus made in praiſe of a ſhip:

Phaſelus ille, quem videtis hoſpites.

The ſecond kind are thoſe called ſimply *iambics*. Theſe have no *iambuſes* but in the even feet, though there are ſometimes tribrachys added to them, excepting to the laſt, which is always an *iambus*; and in the uneven feet they have ſpondees, anapæſt, and even a dactyl, in the firſt: ſuch is that of Medea in Ovid.

Servare potui: perdere an poſſim rogas?

The third kind are the *feet iambic*, verſes, in which it is not abſolutely neceſſary there ſhould be any *iambus*, excepting the laſt foot; of which kind are all thoſe of Phædrus:

Amittit merito proprium, qui alienum appetit.

In comedies, the ancient authors feldom confine themſelves more, frequently leſs, as we may obſerve in Plautus and Terence; but the ſixth is always indiſpenſibly an *iambus*.

As to the varieties, occaſioned by the number of ſyllables, *dimeter iambic* is that which has but four feet:

Quæruntur in ſilvis aves.

Thoſe which have ſix are called *trimeters*: theſe are the moſt beautiful, and are uſed principally for the theatre, particularly in tragedy; wherein they are vaſtly preferable to the verſes of ten or twelve feet, uſed in our modern drama; becauſe they come nearer to the nature of proſe, and favour leſs of art and affectation:

Dii conjugales, tuque genialis tori
Lucina ſuſtes, &c.

Thoſe with eight are called *tetrameters*, and are only uſed in comedies:

Pecuniam in Loco negligere maximum interdum eſt lucrum.
Terent.

Some add an *iambic* monometer, with two feet:

Virtus beat.

They are called *monometers*, *dimeters*, *trimeters*, and *tetrameters*; that is, of one, two, three, and four *iambuſes*; becauſe a meaſure conſiſted of two feet; the firſt meaſuring their verſes two feet by two feet, or by dyas, or epitrites, joining the iambus and ſpondee together.

All the *iambics* hitherto mentioned are *perfect*; they have their juſt number of feet, without any thing either deficient or redundant. The *imperfect iambics* are of three kinds; the *catalectic*, which want a ſyllable:

Muſæ Jovem canebant.

The *brachycatalectic*, which want an entire foot:

Muſæ Jovis gnatæ.

The *hypercatalectic*, which have either a foot or a ſyllable too much:

Muſæ ſorores ſunt Minervæ,
Muſæ ſorores Palladis ingeni.

Many of the hymns and anthems uſed in the Romiſh church, are *dimeter iambics*, that is, conſiſting of four feet.

JAMBLICI *ſal*, in *Medicine*, a kind of ſalt prepared of ſal ammoniac, and ſeveral aromatic ingredients, as pepper, ginger, thyme, origanum, and the like; which has its name from its reputed author Jamblichus, and is ſuppoſed by many old writers to be an excellent medicine for concocting the crude humours, and gently promoting ſtools. It was taken faſting in the quantity of half a ſpoonful, either alone or in a poached egg, or ſpread with any liquor.

JAMBOLIFERA, in *Botany*, a genus of the *octandria monogynia* claſs; the characters of which are, that the calyx is quadridentated, and the corolla has four petals, and is funnel-ſhaped.

JAMBON, in *Natural Hiſtory*, a name given by authors to a kind of ſea-ſhell, reſembling a ham of bacon. It is a ſpecies of PINNA *marina*.

JAMBS, among *Carpenters* and *Bricklayers*. See JAMBS.

JAMBU, in *Ornithology*, the name of a Braſilian ſpecies of partridge, of which there are two ſpecies. They are of a duſky yellow colour, and are equal to the European partridges in the delicacy of their taſte. Margrave.

IAMBUS, ἰαμβος, in the *Greek* and *Latin Proſody*, a poetical foot, conſiſting of a ſhort ſyllable followed by a long one; as in

⏑ – ⏑ –
Θεὸς, λογος, *Dei, meus.*

Syllabe

Syllaba longa brevi subjecta vocatur iambus, as Horace expreſſes it; who alſo calls the *iambus* a ſwift, rapid foot, *pes citus*.

The word, according to ſome, took its riſe from Iambus, the ſon of Pan and Echo, who invented this foot; or, perhaps, who only uſed ſharp biting expreſſions to Ceres, when afflicted for the death of Proſerpine. Some rather derive it from the Greek ος, *venenum*, *poiſon*; or from ιαπτειν, *maledico*, *I rail*, or *revile*; becauſe the verſes compoſed of *iambuſes* were at firſt only uſed in ſatire.

The invention of this kind of verſe is aſcribed by Horace to Archilochus:

Archilochum proprio rabies armavit iambo.
Art. Poet.

JAMES, St. JAMES *of the Sword*, *Sow* JAGO *del Eſpada*, a military order in Spain, inſtituted in 1170, under the reign of Ferdinand II. king of Leon and Galliciæ.

Its end was, to put a ſtop to the incurſions of the Moors; three knights obliging themſelves by a vow to ſecure the road.

An union was propoſed and agreed to in 1370 between theſe and the canons of St. Eloy; and the order was confirmed by the pope in 1175.

The higheſt dignity in that order is that of grand-maſter, which has been united to the crown of Spain. The knights are obliged to make proof of their deſcent from families that have been noble for four generations on both ſides; they muſt alſo make it appear, that their ſaid anceſtors have neither been Jews, Saracens, nor heretics; nor even to have been called in queſtion by the inquiſition.

The novices are obliged to ſerve ſix months in the galleys, and to live a month in a monaſtery. Heretofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permiſſion to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, ſince the year 1652, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloke, with a red croſs on the breaſt. This is eſteemed the moſt conſiderable of all the military orders in Spain: the king carefully preſerves the office of grand-maſter in his own family; on account of the rich revenues and offices, whereof it gives him the diſpoſal. The number of knights is much greater now than formerly, all the grandees chooſing rather to be received into this, than into the order of the Golden Fleece; inaſmuch as this puts them in a fair way of attaining to commands, and gives them many conſiderable privileges in all the provinces of Spain, but eſpecially in Catalonia.

There was an order of the ſame name and kind inſtituted in Portugal by king Don Denys VI. in 1310.

St. James's-Day, a feſtival in the calendar, obſerved on the twenty-fifth of July, in honour of St. James.

Epiſtle of St. JAMES, is a canonical book of the New Teſtament, being the firſt of the catholic epiſtles. See EPISTLE.

JAMMING, in general, denotes the act of cloſing any object between two bodies, ſo as to render it immoveable.

In *Sea-Language*, this expreſſion is applied to the ſituation of ſome running rope, when it happens to be ſqueezed by the compreſſion of the ſtanding-rigging, &c. and conſequently incapable of performing its office, by traverſing in the blocks, till it is releaſed. In this ſenſe *jamming* is oppoſed to RENDERING.

JAMPNUM, in our *Old Writers*, furze, or gorſe, and goſſy ground. This word is uſed in fines of lands, &c and ſeems to come from the French *jaune*, i. e. *yellow*; becauſe the bloſſoms of FURZE or GORSE are of that colour. 1 Coke 179.

JANA, among the *Romans*, a name given to DIANA, or the MOON.

JANITORES, door-keepers, among the Romans, the meaneſt of their ſlaves, who were commonly chained to their poſts.

JANIZARIES, an order of infantry in the Turkiſh armies; reputed the grand ſeignior's foot-guards.

Voſſius derives the word from *genizer*, which, in the Turkiſh language, ſignifies *new ſoldiers*, or *militia*. D'Herbelot tells us, that *jenitcheri* ſignifies a *new band*, or *troop*; and that the name was originally given by Amurath I. called the Conqueror, who chooſing out one-fifth part of the Chriſtian priſoners, whom he had taken from the Greeks, and inſtructing them in the diſcipline of war, and the doctrines of their religion, ſent them to Hagi Bektaſche (a perſon whoſe pretended piety rendered him extremely revered among the Turks), to the end that he might confer his bleſſing on them, and at the ſame time give them ſome mark to diſtinguiſh them from the reſt of the troops. Bektaſche, after bleſſing them in his manner, cut off one of the ſleeves of the fur gown which he had on, and put it on the head of the leader of this new militia: from which time, viz. the year of Chriſt 1361, they have ſtill retained the name *jenitcheri*, and the fur cap. Others aſcribe their origin to ſultan Amurath II. in the year 1372.

The *janizaries* are children of tribute, levied by the Turks among the Chriſtians, and bred up to the military life. They are taken at the age of twelve years, to the end, that forgetting their country and religion, they may know no other parent but the ſultan. However, generally ſpeaking, they are not now-a-days raiſed by way of tribute; for the carach, or tax, which the Turks impoſe on the Chriſtians, for allowing them the liberty of their religion, is now paid in money; excepting in ſome places, where money being ſcarce, the people are unable to pay in ſpecie, as in Mingrelia, and other provinces near the Black Sea.

As in the Turkiſh army, the European troops are diſtinguiſhed from thoſe of Aſia, the *janizaries* are alſo diſtinguiſhed from the *janizaries* of Conſtantinople, and of Damaſcus.

Their pay is from two aſpers to twelve per diem; for when they have a child, or do any ſignal piece of ſervice, their pay is augmented.

Their *habit* conſiſts of a dolyman, or long gown, with ſhort ſleeves, which is given them annually by the grand ſeignior, on the firſt day of Ramazan. They wear no turban, but in lieu of that a kind of cap, which they call *tarcale*, and a long hood of the ſame ſtuff hanging on their ſhoulders. On ſolemn days they are adorned with feathers, which are ſtuck in a little caſe in the fore-part of the bonnet.

Their arms in Europe, in a time of war, are a ſabre, a carabine, or muſquet, and a cartouch-box hanging on the left ſide. At Conſtantinople, in time of peace, they only carry a long ſtaff in their hand. In Aſia, where powder and fire-arms are more uncommon, they wear a bow and arrows, with a poignard, which they call *hanjare*.

The officer who commands the whole body of *janizaries* is called the *janizar agaſi*; in Engliſh, aga of the *janizaries*. He is one of the chief officers of the empire.

Though the *janizaries* are not prohibited marriage, yet they rarely marry, nor then, but with the conſent of their officers; as imagining a married man to make a worſe ſoldier than a bachelor.

The *janizaries* were at firſt called *joja*, that is, footmen, to diſtinguiſh them from the other Turks, the troops whereof conſiſted moſtly of cavalry.

Vigenere tells us, that the diſcipline obſerved among the *janizaries*, is extremely commendable, in a great many things, to that uſed in the Roman legions.

The *janizaries* were heretofore a body formidable even to their maſters, the grand ſeignior. They depoſed Bajazet II. in 1512; they procured the death of Amurath III. in 1595. Oſman II. they firſt ſtripped of his empire, and afterwards of his life, in 1621; and in about two months dethroned Muſtapha, whom they had made his ſucceſſor; and in 1649 they depoſed ſultan Ibrahim, and at laſt ſtrangled him in the caſtle of the Seven Towers; and in 1730 they obtained the ſacrifice of the grand viſir, the reis effendi, and the captain baſhaw, and depoſed and impriſoned Achmet III. and advanced the ſultan Mahomet, ſon of Muſtapha II. from priſon to the throne, in his ſtead. The number of real *janizaries* is only twenty-five thouſand; but the privileges belonging to their order, ſuch as exemption from taxes, and the performance of public duties, have induced many perſons to bribe the officers, in order to their being admitted into the number of *janizaries* without pay.

JANIZARIES, at Rome, are officers or penſioners of the pope, called alſo *participantes*, on account of certain rites or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery.

Moſt authors are miſtaken in the nature of their office: the truth is, they are officers of the third bench, or college of the Roman chancery. The firſt bench conſiſts of writers, the ſecond of abbreviators, and the third of *janizaries*; who are a kind of correctors and reviſors of the pope's bulls.

JANNANINS, in *Modern Hiſtory*, the name which the Negroes, in ſome of the interior parts of *Africa*, give to ſpirits which they apprehend to be the ghoſts or ſouls of their anceſtors, and which they go to the tombs to conſult and worſhip. Every Negro has his tutelary *jannanin*, and ſo has likewiſe every village, to whom private and public worſhip is reſpectively addreſſed. The women, children, and ſlaves, are forbid to attend their public worſhip.

JANNOCK, a kind of oaten bread, much uſed in the northern parts of England and made of four leaves.

JANSENISM, in *Eccleſiaſtical Hiſtory*, the doctrine of Cornelius Janſen, commonly called *Janſenius*, biſhop of

Ypres, in Flanders, chiefly with relation to grace and free-will.

Janſenius was born of catholic parents in Holland, and ſtudied at Utrecht, Louvain, and Paris.

Janſenism made no great noiſe in the world, till after the death of its author, in 1638, when Fromond and Calenus, his executors, publiſhed his book, intitled *Auguſtinus*. This book had been the labour of twenty years, was juſt finiſhed before the author's death, and publiſhed at Louvain in 1640. Janſenius was led to engage in this work by the controverſy that was carried on, in the beginning of the ſeventeenth century, between the JESUITS and DOMINICANS, concerning the nature and neceſſity of divine grace; the deciſion of which had, towards the concluſion of the preceding century, been committed by Clement VIII. to a ſelect aſſembly of learned divines. Theſe arbiters, after much examination, delivered their opinion to the pontiff, that the ſentiments of the Dominicans, concerning grace, predeſtination, human liberty, and original ſin, were more conformable to the doctrine of ſcripture, and the deciſions of the ancient fathers, than the opinions of Molina, which were patronized by the Jeſuits. The former, they obſerved, inclined to the tenets of Auguſtine, and the latter bore a ſtriking reſemblance to the Pelagian hereſy. In conſequence of this declaration, Clement ſeemed reſolved to condemn the Jeſuits, and to determine the controverſy in favour of the Dominicans. In 1602 the Jeſuits prevailed on the old pontiff, by intreaties, menaces, arguments, and complaints, to re-examine this intricate controverſy, and to undertake the office of principal arbitrator. For this purpoſe he choſe a council, called the congregation *de auxiliis*, or the congregation of 1108, compoſed of fifteen cardinals, nine profeſſors of divinity, and five biſhops, which, in the ſpace of three years, aſſembled ſeventy-eight times. The death of Clement, in 1605, prevented his pronouncing a deciſive ſentence with regard to this controverſy; nor are his ſentiments certainly known, though the Jeſuits and Dominicans contend, that his deciſion would have been favourable to their reſpective party. The proceedings of this congregation were reſumed, in 1605, by order of Paul V. the ſucceſſor of Clement. The reſult of many ſolemn deliberations was, that the whole controverſy, inſtead of being decided, ſhould be ſuppreſſed; and that each of the contending parties ſhould have the liberty of following their reſpective opinions. Paul V. declined a public determination of the controverſy, through apprehenſion of offending either the king of France, who protected the Jeſuits, or the king of Spain, who warmly maintained the cauſe of the Dominicans. The flame of controverſy broke out again with new violence in the year 1640, on the publication of Janſenius's book, which was divided into three parts: the firſt being hiſtorical, and containing a relation of the Pelagian controverſy, which aroſe in the fifth century: in the ſecond the author gives an accurate account and illuſtration of the doctrine of Auguſtine, relating to the conſtitution and powers of the human nature, in its original, fallen, and renewed ſtate: and the third part contains his doctrine, relating to the aids of ſanctifying grace procured by Chriſt, and to the eternal predeſtination of men and angels. The deſign of Janſenius in this work was, to ſhew in what manner the important points in debate had been underſtood and explained by Auguſtine, whoſe name and authority were univerſally revered in all parts of the Roman catholic world. The Dominicans, who followed the ſentiments of Thomas Aquinas, concerning the nature and efficacy of divine grace, derived very conſiderable advantage from this publication; whilſt the Jeſuits conſidered it as not only a tacit but formidable refutation of their opinions concerning human liberty and divine grace. They therefore exerted their moſt zealous endeavours to obtain a public condemnation of it from Rome; and they ſucceeded ſo far as to procure a prohibition of the peruſal of it, by the Roman inquiſitors, in the year 1641; and in 1642 a ſolemn bull of Urban VIII. containing it, as fraught with ſeveral errors, that had been long baniſhed from the church. However, the deciſions of the inquiſition, and the bull of the pontiff, were diſregarded in many parts of the Roman church. The doctors of Louvain, the followers of Auguſtine in the Netherlands, and the abbot of St. Cyran, and other famous and learned men, known under the denomination of the Authors of Port-royal, in France, oppoſed the proceedings of the Jeſuits, and ſtrenuouſly ſupported the cauſe of *Janſenius*: though the greateſt part of the French theologiſts engaged in behalf of the Jeſuits. The diſpute was now become very general and violent; and both parties exerted all their learning, art, intereſt, and power, to vindicate their reſpective cauſe. The *Janſeniſts* recurred to miracles in confirmation of their doctrine; and the hiſtory of the controverſy furniſhes many legendary tales of miraculous cures wrought in its favour; the firſt of theſe miracles occurs in 1636, when a pretended thorn of that deriſive crown that was put upon our Saviour's head by the Roman ſoldiers, is reported to have performed ſeveral wonderful cures in the convent of Port-royal: theſe were ſucceeded by other prodigies in the years 1661 and 1664. The ſame pious fraud were revived in 1725, 1727, and 1731, when the bones of the Abbe de Paris, who is ſaid to have been inſtrumental in performing innumerable miracles. However, the oppoſers of the doctrines of St. Auguſtine ſelected five propoſitions out of Janſenius's book, which, by the intereſt and importunities of the Jeſuits, were condemned by a public bull of Innocent X. in 1653. Theſe propoſitions contained the following doctrines:

I. Some commands of God are impoſſible to righteous men, even though they endeavour, with all their powers, to accompliſh them; the grace being wanting, by which they ſhould be enabled to perform them. II. In the ſtate of corrupted nature, a man never reſiſts inward grace. III. To merit and demerit in the preſent ſtate of corrupt nature, it is not requiſite a man ſhould have that liberty which excludes neceſſity; that which excludes conſtraint is ſufficient. IV. The Semipelagians admitted the neceſſity of inward preventing grace to each act in particular, and even to the beginning of faith; but they were heretics, in regard they aſſerted, that this grace was ſuch as that the will of man might either reſiſt or obey it. V. It is Semipelagianiſm to ſay, that Jeſus Chriſt died, or ſhed his blood, for all men in general.

Of theſe propoſitions the pontiff declared the firſt four only heretical; but he pronounced the fifth rath, impious, and ſubverſive to the Supreme Being. The *Janſeniſts*, availing themſelves of a ſubtle diſtinction invented by Arnaud, conſidered ſeparately in this controverſy the matter of doctrine, and the matter of fact, i. e. they acknowledged themſelves bound to believe that the five propoſitions above mentioned were juſtly condemned by the Roman pontiff; but they maintained, that the Pope had not declared, and conſequently, that they were not bound to believe, that theſe propoſitions were to be found in Janſenius's book, in the ſenſe in which they had been condemned. But this artful diſtinction was of no long ſervice to them; for Alexander VII. iſſued out a ſolemn bull in 1656, declaring, that the five propoſitions that had been condemned, were the tenets of Janſenius, and were contained in his book; and in 1665 he ſent into France the form of a declaration, that was to be ſubſcribed by all who ſought preferment in the church, affirming that the five propoſitions were to be found in the book of Janſenius, in the ſame ſenſe in which they had been condemned by the church. This declaration produced the moſt deplorable tumults; the *Janſeniſts* maintaining that the deciſions of the pope, ſo far as they were not confirmed by a general council, with regard to matters of fact, were fallible; and the Jeſuits, on the contrary, that an unlimited confidence in the papal deciſions, both with reſpect to matters of fact, and of opinion, was an eſſential character of a well grounded and divine faith. The Jeſuits prevailed, and the *Janſeniſts* ſuffered exile, impriſonment, and various kinds of proſecution. Clement IX. in conſequence of the ſpirited remonſtrance of ſeveral biſhops, and the earneſt application of Anne Genevieve de Bourbon, ducheſs of Longueville, accepted a conditional ſubſcription to the declaration of his predeceſſor, allowing the *Janſeniſts* the privilege of interpreting it in their own ſenſe. This indulgence reſtored tranquillity, and produced a period in this controverſy, commonly called the Peace of Clement; but it was ſoon diſturbed again by a public edict of Lewis XIV. and totally abliſhed after the death of the ducheſs of Longueville, in the year 1679. The famous Arnaud retreated on this occaſion into Holland, where he gained over the Romiſh congregations to the *Janſeniſt* party: and this party, ſheltered under the protection of the Dutch governments, has ſince prevailed in that country. The *Janſeniſts* were particularly offenſive to the Jeſuits, on account of the auſterity of their party, and the ſeverity that reigned in their ſyſtem of moral diſcipline and practical religion, for they have exclaimed againſt the corruptions of the church of Rome, both with regard to its doctrines and morals; and urged the neceſſity of inſtructing the people in the doctrines and precepts of Chriſtianity; with this view they have maintained that the holy ſcriptures and public liturgies ſhould be peruſed by the people in their mother tongue; and taught, that true piety does not conſiſt in the obſervance of pompous rites, or in the performance of external acts of devotion, but in inward holineſs and divine love. This apparent piety of the *Janſeniſts* has, however, been unhappily blended with ſuperſtition and fanaticiſm; and they have been branded, not altogether without reaſon, with the denomination of MYSTICS and *Rigoriſts*. See QUIETISM. The con-

tro-

troversy relating to *Jansenism*, which was one of the principal sources of that division which reigned within the papal jurisdiction, has been carried on with great animosity in France and the Netherlands; and the *Jansenists* were for a considerable time much inferior to the Jesuits in number, power, and influence, though they equalled their adversaries in reformation, prudence, and learning, and surpass them in sanctity of manners and superstition, by which they excite the respect of the people. The United provinces, particularly the Netherlands, have afforded them an asylum on many occasions: nevertheless the Jesuits, though they have no legal toleration in that republic, have been lately gaining ground among the Dutch papists. They have a flourishing chapel in the city of Utrecht, and places of worship in several other cities, and in a great number of villages. Towards the close of the last and the commencement of the present century, the cause of the *Jansenists* acquired reputation, by a French translation of the New Testament, made by the learned and pious Paschasius Quesnel, a priest of the Oratory; in the annotations to which he has artfully blended the quintessence of *Jansenism*. This work, at the instigation of the Jesuits, and particular application of Lewis XIV. to the court of Rome, was condemned by Clement XI. who, in 1713, issued out the famous bull UNIGENITUS, in which Quesnel's New Testament was condemned, and one hundred and one propositions contained in it pronounced heretical. The controversy relating to *Jansenism* was much heated and increased, instead of being mitigated or suspended, by this despotic and ill-judged edict. The *Jansenists* were again obliged to recur to writings, and even to miracles, and visions, and pretended revelations for the support of their declining cause. However, the storm of resentment that has lately arisen against the JESUITS, and that has been attended with the extinction of their order in Portugal, France, and in all the Spanish dominions, has disarmed the most formidable adversaries of *Jansenism*, and must be considered as an event highly favourable to the *Jansenists*. Mosheim's Eccl. Hist. vol. iv. p. 360, &c. vol. v. p. 77, &c. Eng. ed. 1768, 8vo.

JANUARY, the name of the first month of the year, according to the computation now used in the West.

The word is derived from the Latin *Januarius*, a name given it by the Romans, from *Janus*, one of their divinities, to whom they attributed two faces; because on the one side the first day of January looked towards the new year, and, on the other, towards the old one.—The word *Januarius* may also be derived from *janua*, gate: in regard this month being the first, is, as it were, the gate of the year.

February and *February* were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March.

The Christians heretofore fasted on the first day of *January*, by way of opposition to the superstition of the Heathens, who in honour of Janus, observed this day with feastings, dancings, masquerades, &c.

JANUARIUS's *Blood*. See *Religious uses* of BLOOD. The head of this saint is occasionally carried in procession at Naples, in order to stay the eruption of Vesuvius.

JANUS, *Temple of*, in *Ancient History*, a square building at Rome (as some say) of entire brass, erected by Romulus, and so large as to contain a statue of Janus five feet high, with brazen gates on each side, which were always kept open in time of war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was *first* shut during the long reign of Numa, who instituted this ceremony. 2. In the year of the city 519, after the end of the first Punic war. 3. By Augustus after the battle of Actium, in the year of Rome 725. 4. On Augustus's return from the war which he had against the Cantabrians in Spain, A. U. C. 729. Under the same emperor, in the year of Rome 744, about five years before the birth of Christ, when there was a general peace throughout the whole Roman empire, which lasted twelve years. 6. Under Nero, A. U. C. 811. 7. Under Vespasian, A. U. C. 824. 8. Under Constantius, when upon Magnentius's death he was left sole possessor of the empire, A. U. C. 1105. Some dispute the authority in which it is said to have been shut by Constantius, and say that the last time of its being shut was under Gordian, about the year of Rome 994. Virgil gives us a noble description of this custom:

Sunt geminæ Belli portæ, sic nomine dicunt, &c.
Æn. lib. vii. ver. 607, &c.

The origin of this custom is not certainly known. See Macrob. Saturn. lib. i. cap. 9. and Virgil *Æn.* lib. vii. v. 601—622.

JAPACANI, in *Ornithology*, the name of a Brasilian bird of the small sort: its beak is black, long, and pointed, and a little bent downward; its head is black, and its back, neck, and wings, are of a greenish brown, mixed with black; the tail is black above, and is spotted with white underneath; its breast is of a mixture of white and yellow, as are also its belly and thighs; and these are variegated with transverse black streaks. Margrave.

JAPAN *Earth*, see CATECHU. The tree or plant from which the *Japan earth* is extracted is a species of the MIMOSA of Linnæus, and is very common on the uncultivated mountains of Hindostan, in the provinces of Bahar, westward of Bengal. The substance is extracted from the interior coloured wood, which is cut into chips, and put into a narrow-mouthed unglazed earthen pot: a quantity of water almost sufficient to cover the chips is poured upon them, which is half evaporated by boiling, and then the decoction, without being strained, is poured into a flat earthen pot and boiled to one third part: this is set by in a cool place for one day, and afterwards evaporated by the heat of the sun, stirring it several times in a day: when it is reduced to a considerable thickness, it is spread upon a mat or cloth, which has been previously covered with the ashes of cow-dung, divided into square or quadrangular pieces by a string, and completely dried by turning these frequently in the sun till they are fit for sale. The extract thus prepared is bought of the manufacturer for twelve or fifteen shillings the Bolts weight. It is much used by the natives in dying and painting chintz and other cloths, combined with the vitriolic salts, a black colour is produced; mixed with oil they paint the beams and walls of houses to preserve them, and to defend them from the destructive white ants; and it is sometimes mixed with their wall plaister. This extract is used only medicinally as a cooling medicine, and when too profusely used it is said to be a destroyer of venereal pleasures. It is also given at the rate of two ounces a day to tame vicious horses. This extract is likewise a principal ingredient in one of their ointments, of great repute, composed of blue vitriol, four drams; *Japan earth*, four ounces; alum, nine drams; white resin, four ounces; which are reduced to a fine powder and mixed with the hand, adding of olive oil ten ounces, and water sufficient to bring the mass to the proper consistence of an ointment: this ointment is used in every sore from a fresh wound to a venereal ulcer. *Med. Obs.* and Inq. vol. v. art. 16.

The London college directs *Japan earth* to be made into troches by beating it with an equal weight of gum arabic, and four times the weight of both, of sugar of roses, and a sufficient quantity of water; but the college of Edinburgh orders one part of the *Japan earth*, four of gum tragacanth, and twenty-four of fine sugar, with rose-water. The *tinctura Japonica* is prepared by digesting three ounces of the *Japan earth* and two of cinnamon in a quart of proof spirit; and this tincture may be given in doses of two or three spoonfuls. For the method of preparing *Japonic confection*, see CONFECTION. *Japan earth* dissolved in water is of a full brown colour, a little inclined to red. It is sometimes used in water-painting, where it has a good effect; but its gummy texture renders its use improper in oil.

JAPANNERS *Gilding*, see GILDING.

JAPANNING, the art of varnishing, and drawing figures on wood, &c. after the same manner as the workmen do who are natives of Japan, a famous island not far from the coast of China.

The varnish made and used in China and Japan is composed of turpentine, and a curious sort of oil they have. This they mix and boil up to a proper consistence, and this never causes any swelling in the hands or face of the people who use it. The swellings in these parts, which often happen to those who work the lacquered ware, and sometimes to those who only pass by the shops of these people, is from the lack, and not the varnish. This lack is the sap or juice of a tree, which runs slowly out on cutting the lower part of the trunk of the tree, and is received in pots set on purpose under the incisions. The juice as it flows from the tree is of the colour and consistence of cream; and as it comes in contact with the external air, its surface becomes black. As they only use it when black, their method of preparing it is to set it out in the open air, in large flat bowls, in which it looks all surface; but that the whole may be of the same uniform colour, they continually stir it for twenty-four hours together, with a smooth piece of iron. By this means the whole becomes thicker than it was before, and of a fine deep black. When it is in this state they powder some burnt boughs of trees, and mix them thoroughly with it; and then spreading it thin over any board which they intend to japan, it is soon dried in the sun, and is then absolutely harder than the board it is laid on. When this is thoroughly dry they polish it over with a smooth stone and water, till it is as smooth as glass; and then wiping it very dry, they lay on the varnish, made of oil

and turpentine, and boiled to a proper conſiſtence for this kind of work.

If the work is to be of any other colour than black, that colour is to be mixed with the varniſh, and then the whole ſpread on very thinly and evenly; for on this laying it on depends the principal art of varniſhing. When there are to be *figures* in gold and ſilver, theſe muſt be traced out with a pencil in the varniſh over the reſt of the work; and when this varniſh is almoſt dry, the leaf-gold or leaf-ſilver is to be laid on, and poliſhed afterwards with any ſmooth ſubſtance.

The ſubſtances which admit of being *japanned* are almoſt thoſe of every kind that are dry, and not too flexible; as wood, metals, leather, and paper prepared. Wood and metals require no other preparation, except that of cleaning their ſurfaces, and rendering them perfectly even. But leather ſhould be leaſurely ſtrained either on frames or on boards; and paper ſhould be treated in the ſame manner, and have a previous ſtrong coat of ſome kind of ſize; but it is rarely made the ſubject of *japanning*, till it is converted into PAPIER *maché*, or wrought, by other means, into an inflexible form. One principal variation in the manner of *japanning* is the uſing or omitting any priming or under-coat on the work to be japanned. In the older practice, ſuch priming was always uſed; and is at preſent retained in the French manner of *japanning* coaches and ſnuff-boxes of the *papier maché*. But in the Birmingham manufacture it has always been rejected. The advantages attending the uſe of ſuch priming are, that it makes a ſaving in the quantity of varniſh neceſſary to be uſed, and that it helps to form, by means of rubbing and water-poliſhing, an even ſurface for the varniſh. However, when an under-coat of ſize is uſed, the japan coats of varniſh and colour will be always liable to crack and peel off, and are leſs durable than thoſe which are formed without ſuch priming. This difference is obſervable in comparing the wear of the Paris and Birmingham ſnuff-boxes.

The laying in of the colours in varniſh or oil inſtead of gum-water, is another variation from the method of *japanning* formerly practiſed. But if the colours are tempered with the ſtrongeſt iſinglaſs ſize and honey, inſtead of gum-water, and laid on very flat and even, the work will not be much inferior in appearance to that done by the other method, and will laſt as long as the common old *japan* work, the beſt kinds of the true *japan* excepted. The proper *japan* grounds are either ſuch as are formed by the varniſh and colour, where the whole is to remain of one ſimple colour; or, by the varniſh either coloured, or without colour, on which ſome painting or other decoration, is afterwards to be laid. The priming, or undercoat, which is ſometimes uſed in *japanning*, is of the ſame nature with that called clear-coating, practiſed by the houſe-painters; and conſiſts in laying on and drying in the moſt even manner a compoſition of ſize and whiting. The common SIZE has been generally uſed; but in nicer works, the glovers or the parchment ſize, improved by adding a third of iſinglaſs, will be preferable. The work ſhould be prepared for this priming, by being well ſmoothed with fiſh-ſkin, or the glaſs-ſhaver; and by being bruſhed over once or twice with hot ſize diluted, when it is of the common ſtrength, with two thirds of water. The priming, formed of a ſize whoſe conſiſtence is between that of the common kind and glue, mixed with as much whiting as will give it a ſufficient body of colour to hide the ſurface on which it is laid, ſhould be laid on evenly with a bruſh. Two coats of this priming will generally be ſufficient; but if, upon trial with a fine wet rag, it will not receive a proper water-poliſh, another coat or more muſt be given it. And after the laſt coat but one is dry, the work ſhould be ſmoothed by rubbing it with the Dutch ruſhes. When the laſt coat is dry, the water-poliſh ſhould be given, by paſſing over every part of it with a fine rag, a little moiſtened, till the whole appears perfectly plain and even. The work is then ready to receive the painting or coloured varniſh.

When wood or leather is to be *japanned*, without priming, it may be prepared by laying on two or three coats of coarſe varniſh, made by diſſolving two ounces of ſeed-lac, and as much roſin in one pint of rectified ſpirit of wine; and then the proper *japan-ground* muſt be laid on. As metals never require to be under-coated with whiting, they muſt generally be treated in the ſame manner as wood or leather.

For white japan-grounds. Prepare a white varniſh, by working and grinding flake white, or white lead, with a ſixth part of its weight of ſtarch, and drying the mixture; then temper it into a conſiſtence fit for ſpreading with *maſtic* VARNISH, or compound it with gum animé; lay this on the body to be *japanned*, previouſly prepared with or without the under-coat of whiting: and varniſh it over with five or ſix coats of the following varniſh, formed by diſſolving two ounces of the cleareſt and whiteſt grains of ſeed-lac, and three ounces of gum animé, pulveriſed, in about a quart of ſpirit of wine, and ſtraining off the clear varniſh.

A very good varniſh, free from brittleneſs, may be obtained by diſſolving as much gum animé as the oil will take in old nut or poppy oil, boiled gently when the gum is put into it. The ground of white colour may be laid on in this varniſh, and then a coat or two of it may be put over the ground; but it muſt be well diluted with oil of turpentine when it is uſed.

Blue japan grounds may be formed of bright Pruſſian blue; or of verditer glazed over with Pruſſian blue; or of ſmalt. The colour may be beſt mixed with ſhell-lac varniſh, and brought to a poliſhing ſtate by five or ſix coats of varniſh of ſeed-lac. But when a bright blue is required, and a leſs degree of hardneſs can be diſpenſed with, the method before directed, in the caſe of white grounds, muſt be purſued.

Red japan grounds. For a ſcarlet ground, vermilion may be uſed: but this is leſs beautiful than the crimſon produced by glazing it over with carmine or fine lake, or roſe-pink. For a very bright crimſon, inſtead of glazing with carmine, the Indian lake, called faſſlower, ſhould be uſed, diſſolved in the ſpirit of which the varniſh is compounded. But in this caſe, inſtead of glazing with the ſhell-lac varniſh, the upper or poliſhing coats need only be uſed; which will render this a cheaper method than the uſing carmine. If the higheſt degree of brightneſs be required, the white varniſhes muſt be uſed.

Yellow japan grounds. For bright yellow grounds, king's yellow, or turpeth mineral ſhould be uſed, either by themſelves or mixed with fine Dutch pink. The effect may be ſtill more heightened by diſſolving powdered turmeric root in the ſpirit of wine, of which the upper or poliſhing coat is made; which ſpirit of wine muſt be ſtrained off from the dregs, before the ſeed-lac be added to it for forming the varniſh.

Yellow grounds may likewiſe be formed of the Dutch pink only.

Green japan grounds may be produced by mixing king's yellow and bright Pruſſian blue; or turpeth mineral and Pruſſian blue. A cheap, but fouler kind may be had from verdigris with a little of the fore-mentioned yellows, or Dutch pink. But if a very bright green be wanted, the cryſtals of verdigris, called diſtilled verdigris, ſhould be uſed, and their effect will be heightened by laying them on a ground of leaf-gold. Any of theſe may be uſed with good ſeed-lac varniſh, but will be brighter with the white varniſh.

Orange coloured japan grounds may be formed of mixed vermilion or red lead with king's yellow, or Dutch pink; or orange lake, or red orpiment will make a better orange ground than can be produced by any mixture.

Purple japan grounds may be produced by the mixture of lake and Pruſſian blue; or a fouler kind, by vermilion and Pruſſian blue.

Black japan grounds may be formed, without heat, by either ivory-black, or lamp-black, which may be laid on with the ſhell-lac varniſh: and the upper or poliſhing coat may be common ſeed-lac varniſh.

For forming the common *black japan grounds* on iron or copper by means of heat, the work muſt be firſt painted over with drying oil; and when it is moderately dry, put into a ſtove of ſuch a degree of heat, as will change the oil black, without burning it. The heat ſhould be ſlowly augmented and continued for a long time, in order to harden the coat of *japan*. This kind of varniſh requires no poliſh.

Tortoiſe-ſhell japan grounds. The beſt is made by means of the following varniſh; prepared by boiling together one gallon of good linſeed oil and half a pound of umbre, till the oil becomes very brown and thick; by ſtraining the mixture through a coarſe cloth, and ſetting it again to boil, till it acquires the conſiſtence of pitch. On the piece of work to be *japanned*, well-cleaned, let vermilion, tempered with ſhell-lac varniſh, or with drying oil diluted with oil of turpentine, be laid thinly on the places deſigned to imitate the more tranſparent parts of the tortoiſe-ſhell.

When the vermilion is dry, bruſh over the whole with the black varniſh, tempered to a due conſiſtence with oil of turpentine; and when it is ſet and firm, put the work into a ſtove, where it may undergo a very ſtrong heat, and be continued for a conſiderable time. This method propoſed in one of Kunkel's recipes, has been revived in the Birmingham manufactures, where it is purſued in forming the ground of ſnuff-boxes, dreſſing-boxes, tea-waiters, &c. this ground may be decorated with painting and gilding in the ſame manner as any other varniſhed ſurface.

Japan-work ought properly to be painted with colours in varnish. See PAINTING *in varnish* and VARNISH. The colours are now moſt frequently tempered in oil, having a fourth part of its weight of gum anime previouſly diſſolved in it. This oil ſhould be well diluted with ſpirit of turpentine when it is uſed, that the colours may be laid more evenly and thin, and thus fewer of the poliſhing coats of varniſh will be neceſſary. When water-colours are laid on grounds of gold, ſo as to have the effect of embolſted work, they are beſt prepared by means of iſinglaſs ſize corrected with honey or ſugar-candy. The body of which the embolſted work is raiſed may be formed of a very ſtrong gum-water, thickened to a proper conſiſtence by bole armeniac and whiting, in equal parts, which being laid on in the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the iſinglaſs ſize, or in the general way with ſhell-lac varniſh.

The finiſhing part of *Japanning* conſiſts of laying on and poliſhing the outer coats of varniſh. This is in general beſt done with common *ſeed-lac* VARNISH. But where brightneſs is principally regarded, the ſeed-lac muſt give way to the whiter gums. When hardneſs, tenacity, and brightneſs are deſired, the mixed varniſh made of the picked ſeed-lac, already propoſed under *white Japan grounds*, ſhould be adopted. The pieces of work to be varniſhed ſhould be placed near a fire, and made perfectly dry; the varniſh ſhould then be rubbed over them with proper brushes; firſt one coat, and when this is dry another ſhould be laid over it; and this operation muſt be continued at leaſt five or ſix times. When a ſufficient number of coats is thus laid on, the work is fit to be poliſhed, which muſt be done, in common caſes, by rubbing it with a rag dipped in tripoli, commonly called rotten-ſtone, finely powdered, but toward the end of the rubbing, a little oil of any kind ſhould be uſed with the powder: and when the work appears ſufficiently bright and glolſy, the oil alone ſhould be uſed to clear it from the powder, and to give it a brighter luſtre. For white grounds, fine putty or whiting ſhould be uſed inſtead of the tripoli. For gilding of *Japan* work, ſee *Japanners* GILDING. Hannmaid to the Arts, vol. ii. p. 479, &c.

JAPONIC *Confection*, ſee CONFECTION.

JAPU, in *Ornithology*, the name of a Braſilian bird, of the woodpecker kind, called alſo *japupika*. It is wholly of a fine ſhining black colour, except that it has a large yellow ſpot on the middle of each wing, and a broad yellow ſtreak near the rump. This bird hangs its neſt very nicely from the extreme boughs of trees; and from the form of theſe neſts, and not knowing to what bird they belonged, has ariſen the error of ſuppoſing that the parrots hang their neſts in this manner. Ray.

JAR, or JARA, from the Spaniſh, *jarra* or *jarro*, which ſignify the ſame, an earthen pot or pitcher, with a big belly, and two handles.

JAR is uſed for a ſort of meaſure, or fixed quantity of divers things.—The *jar* of oil is from eighteen to twenty-ſix gallons: the *jar* of green ginger is about a hundred pounds weight.

JAR or IJAR, in *Chronology*, one of the Hebrew months, anſwering to our April. It was the eighth month of the civil year, and the ſecond of the ſacred, and had only twenty-nine days.

JARARA-COAYPITINGA, in *Zoology*, the name of a ſpecies of ſerpent found in America, not much unlike the common viper, and equally venomous. Its tail is of a paler colour than the reſt of the body, and thence it has its name; which, in the language of the natives, expreſſes this property.

JARARA-IPEBA, in *Zoology*, the name of a ſpecies of American ſerpent, of a brown colour, but variegated by a very beautiful undulated red line, running all along the back like a chain. Ray.

JARARACA, in *Zoology*, the name of a ſpecies of ſerpent, common in America. It is a very ſhort ſerpent, ſeldom exceeding a foot and a half in length. It has ſome prominent veins on its head, and is of a duſky brownish colour, variegated with red and black ſpots. It is a very poiſonous ſpecies. The natives uſe for a remedy the root of a plant called caatia, and by the Portugueſe herva de cobras. Ray.

De Laet has deſcribed four different ſpecies of this ſerpent.

JARARACULU, in *Zoology*, the name of an American ſpecies of ſerpent. It is of the viviparous kind, and produces a great number of young; thirteen having been found perfectly formed in the body of a female of this kind; it grows to between two and three feet long, and has like the other poiſonous ſerpents very large and long teeth, which are hid in the gums, and contain a yellow poiſonous liquor. Theſe it only exerts at the time of biting, and its poiſon is ſo fatal, that it will deſtroy a man within four and twenty hours. Ray.

JARDES, or JARDONS, in the *Manege*, are callous and hard ſwellings in the hinder legs of a horſe, ſeated on the outſide of the hough, at the ſpavin is on the inſide. *Jardons* lame a horſe, unleſs you give the fire dexterouſly and betimes.

JARIBOLUS, *Lapidary*, in *Antiquity*, one of the Palmyrenian gods. This deity, in all appearance, had the ſame attributes with the god Lunus; for *Jari* ſignifies the month over which the moon preſides. Mem. Acad. Inſcrip. tom. iii. p. 179.

JARRETIER, in the *Manege*, an obſolete French word, ſignifying a horſe whoſe houghs are too cloſe together; which is now expreſſed in French by *crochu*, i. e. crooked or hocked.

JARUS, in *Botany*, a name by which ſome authors have called the *arum*, or *wake-robin*.

JASIDÆANS, in the *Hiſtory of Religion*. See JESIDES.

JASINE, in *Botany*, a name uſed by the antients to expreſs a ſmall kind of climbing plant, much reſembling that from which they obtained the drug called *ſammony*. They therefore called this ſometimes the ſmall *ſammony*, or *ſammonia parva*. It climbed upon trees, and had ſmall ivy-like leaves. Pliny has deſcribed ſuch a plant as this under the name of *laugion*; and it ſeems very probable that this was only a corruption of the word *jaſine*, that author having taken moſt of his accounts from the Greeks, and having frequently miſtaken their names.

JASIONE, in *Botany*, *rampions with globoſe heads*, a genus of the *ſyngeneſia monogamia* claſs: the characters of which are, that it has a common ten-leaved calyx; that the corolla is regular and has five petals; and that the fruit is a bilocular capſule. This plant grows naturally on ſterile grounds in moſt parts of England; and is rarely admitted into gardens.

JASMEL.EUM, a medicinal oil, called alſo by the Perſians *jaſmé*: it is made by putting two ounces of the white flowers of violet into a pint of oil of ſeſamum. It is uſed to anoint the body after bathing, and is in great eſteem among the Perſians for its fragrancy, though it is a ſort of ſmell which many would rather think offenſive.

JASMINE, or JESSAMINE-*tree*, *jaſminum*, in *Botany*, a genus of the *diandria monogynia* claſs. Its characters are as follow: the flower has a tubulous empalement, which is permanent, cut into five ſegments at the brim; the flower is of one petal, cut into five ſegments at the top, to which ſpread open; it has two ſhort ſtamina, ſituated within the tube of the petal; in the centre is ſituated a roundiſh germen, which afterwards turns to an oval berry, with a ſoft ſkin including two ſeeds, which are flat on thoſe ſides which join, and convex on the other. Miller reckons ſeven ſpecies.

The common white *jaſmine* grows naturally in Malabar, and in ſeveral parts of India: it has, however, been long inured to our climate, ſo as to thrive and flower extremely well, but never produces fruit in England. It is propagated by laying down the branches, which will take root in a year, and may then be cut from the old plant, and planted where they are to remain. It may alſo be propagated by cuttings, which ſhould be planted early in the autumn, and in a ſevere winter preſerved by tan, ſaw-duſt, or peaſe-haulm, &c. and when they are removed, they ſhould be planted againſt a wall, pale, or fence, that may ſerve to ſupport their flexible branches.

Theſe plants ſhould be permitted to grow rude in ſummer, otherwiſe they will not flower; but after they are paſt, the branches ſhould be pruned and nailed up about the middle or latter end of March, when the froſt is paſt. Miller.

JASMINE, *Arabian*, *nyctanthes*, in *Botany*, a genus of the *diandria monogynia* claſs. Its characters are theſe: the empalement of the flower is cylindrical, of one leaf, cut into eight acute ſegments; the flower is of the ſalver-ſhape, of one leaf, with a cylindrical tube longer than the empalement, cut into eight ſegments at the top; it hath two ſmall awl-ſhaped ſtamina, ſituated in the bottom of the tube; and one roundiſh depreſſed germen, ſupporting a ſingle ſtyle the length of the tube, crowned by a bifid erect ſtigma; the germen afterward becomes a roundiſh berry with two cells, each containing a large roundiſh ſeed. Miller reckons only two ſpecies, natives of India.

JASMINE, *Baſtard*, *ceſtrum*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath a ſhort tubular empalement of one leaf, indented at the top into five parts; the flower is funnel-ſhaped, of one petal, having a long cylindrical tube, which ſpreads open at the top, and is cut into five equal ſegments; and it has five ſlender ſtamina; the oval cylindrical germen is ſituated in the empalement, which becomes an oval oblong berry with one cell, including ſeveral roundiſh

feeds. Miller enumerates six species, natives of the West Indies; they cannot therefore be preserved in England without the heat of a stove, especially in winter.

JASMINE, *Bastard*. See LYCIUM and BOX-THORN.

JASMINE, *Cape*. See GARDENIA.

JASMINE, *Female-berried*, a name sometimes given to *guaranitis*. See *Scandent* CONVOLVULUS.

JASMINE, *Sea-berried*. See LANTANA.

JASMINE, *Persian*, the name by which some call LILAC.

JASMINE, *Red*, *Plumeria*, in *botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flower has a small cempalement, divided into five parts; it hath one funnel-shaped petal, with a long cube, cut into five oblong oval segments at the top, which spread open; and five awl-shaped stamina, situated in the centre of the tube, terminated by summits which close together; also an oblong bifid germen, with scarce any style, crowned by a double acute stigma; the germen afterward becomes a long, swelling, acute-pointed capsule, with one cell, filled with winged seeds, placed over each other like scales of fish. Miller enumerates five species.

All these sorts are too tender to thrive in the open air of this country in the summer season, therefore should be constantly preserved in the stove, where, in warm weather, they must have a large share of free air, but in cold weather must be kept very warm. The milky juice of these plants is very caustic, and reckoned poisonous. In cutting off any branches of the plants, if the knife be not immediately cleaned, the juice will corrode it, and turn the blade almost black in a little time so as not to be cleaned off again; and if dropped on linen, it will cause it to waste in holes, like aqua fortis. Miller.

JASMINE, *Scarlet and yellow*. See TRUMPET-*flower*.

JASMINOIDES, or *Bastard*, the BOX-THORN, AVICENNIA-BERRY, and LYCIUM.

JASPACHATES, in the *Natural History of the Ancients*, a name given to a species of agate, variegated with the matter of the jasper, and therefore being properly distinguished by this name. It is found at this time very plentifully both in the East and West Indies, and in many parts of Italy, Germany, and other parts of Europe; and is a very elegant stone. Its colour is always composed of a brown and green, but it is very irregular in the admixture of these. Sometimes it is one equally coloured mass, and is only distinguishable from the green jaspers by its superior hardness and brightness; but it is much more frequently found of a brownish green ground, variegated with irregular concentric circles of a fairer green, and often with some of a beautiful red, or with a brownish green ground, irregularly clouded and spotted with those colours; it often has also an admixture of white and yellow.

Our lapidaries esteem the oriental pieces of this stone very valuable, and work them into many sorts of toys. The German are softer, and of little value. Hill's Hist. of Fossils, p. 489.

JASPER, (the word is Hebrew, and has neither been changed by the Greeks, Latins, nor us; some Greek versions give it the name of *beryl*; Ockelos calls it *panther*, in regard of its being spotted like that animal) *jaspis*, in *Natural History*, a genus of stones of the scrupi-kind, according to the arrangement of Dr. Hill, greatly resembling the finer marbles, or semi-pellucid gems. According to others, it belongs to the genus of the siliceous or flint-kind; differing from FLINTS and CHINTZ, in being opake, more easily fusible by fire, in having a granulated texture, and in frequently composing large masses or rocks; whereas flints and cherts are generally in form of nodules or lumps.

Jaspers, though commonly reckoned among the precious stones, undoubtedly belong (says Dr. Hill), to the class of fossils above referred to; being only detached opake masses of various forms and sizes, and composed of a crystalline matter, debased with an earthy admixture. It is to this last ingredient of their composition, that they owe all that variety of colours, and difference of opacity, whence naturalists have subdivided them into no less than seven orders, containing the white, the green, the red, &c. *jaspers*.

Of the white *jaspers*, there is only one known species, the hard, shining, white marbled *jasper*, commonly called the NEPHRITIC *stone*, on account of its supposed virtue in cases of the stone and gravel. It is found in many parts of America, particularly the great river of the Amazons, and worn by the natives as an amulet. As to its medical virtues, they are too ridiculous to deserve a serious refutation; but its other uses merit the attention of lapidaries, since it is capable of being fashioned into cups and vases of a beautiful polish, and great brightness.

Of the green and greenish *jaspers*, we have the following species: 1. The hard, fine green *jasper*. This is found in many parts of the world, as Egypt, Tartary, China, &c. and worn as an amulet against fluxes, haemorrhages, &c. 2. The soft dusky-green *jasper*. This stone, which is of much less beauty and value than the foregoing species, is very common in Germany, Italy, France, England, &c. 3. The hard bluish-green *jasper*, with red variegations: this is the HELIOTROPE of the ancients, and BLOOD-*stone* of the moderns. It is common in Africa, Egypt, and the East Indies, and is worked into cups, vases, and snuff-boxes. 4. The hard whitish-green *jasper*, which is the nephritic stone of authors. It is found in many parts of America, where the natives fashion it into figures of birds, beasts, fishes, and other forms; and formerly used to wear it hung to their lower lips. A thousand amazing stories are told, by very grave authors, of the nephritic qualities of this stone. 5. The hard yellowish-green *jasper*, celebrated likewise for its nephritic virtues. It is found in several parts of America, as also in Germany, Bohemia, and some other countries of Europe. 6. The bluish-green marbled *jasper*, variegated with grey and black. 7. The hard, greyish-green *jasper*, called by authors the JADE, or LAPIS *divinus*, the *divine* stone. 8. The dull deep-green *jasper*, called by different authors *enchore*, *memphites*, and *malachites*. 9. The bluish-green, softer, dull *jasper*. This is the *beron*, or sky-coloured *jasper*, of the ancients, and makes a very beautiful appearance in cups, vases, and other ornamental things. 10. The dusky-green *jasper*, variegated with white and flesh-colour; this, though a coarser species than the preceding one, is not without its beauty.

Of the red *jaspers*, we know only four species: 1. The hard, variegated, purple *jasper*: this is the rose-coloured *jasper* of authors. It is a very beautiful stone, and capable of a high polish. It is found in the East and West Indies, as also in Germany, Bohemia, and Spain, but of a coarser kind. 2. The bright red *jasper*, variegated with white. America and Europe both afford this species; but those from the former are the finest. 3. The dull purple and white *jasper*. This, though of a coarse and irregular structure, is not unfrequently found manufactured into handles of knives, and other toys, both in England, Italy, and Germany. 4. The hard, dull flesh-coloured *jasper*. It is of an extremely pale whitish red, generally throughout.

The fourth order of *jaspers* contains those of a [illegible] colour, of which we have only one species, the [illegible] hard *jasper*, with purple veins. It is [illegible] Yorkshire and Suffex stones, and also in [illegible] gravel-pits.

The fifth order contains the yellowish *jaspers*, of which there is only one known species, the yellow [illegible] rigated *jasper*. This is the turpentine-coloured [illegible] the ancients. It is very common in the East Indies; and we have it also in Germany, Bohemia, and other parts of Europe, but inferior to the oriental ones.

The bluish *jaspers* constitute a sixth order; and of these there are only two species: 1. The pale bluish *jasper*, with black veins and clouds; called by the ancients the smoaky *jasper*. 2. The bluish marbled *jasper*, variegated with white.

The seventh and last order of *jaspers* contains the black ones, whereof there are only two species: 1. The black marbled *jasper*, variegated with white. 2. The black marbled *jasper*, variegated with yellow. Hill's Hist. Foss. p. 573—582.

In some of these stones, as also in the agates, nature has amused herself, in representing rivers, trees, animals, landscapes, &c. as if they were painted. The *jasper*, found in the Pyrenean, is usually stained with various colours; though there are some that have but one colour, as red, or green; but these are the least valuable: the most beautiful is that bordering on the rose-colour, or purple; next to that, the carnation; but that [illegible] is now most valued, is the green spotted with red.

The curious Becher having a mind to melt a *jasper*, powdered it, and putting it into a crucible, luted close the lid on it, and giving it an intense fire melted it; and found this very remarkable truth, that the colour of this stone, though no more permanent in the fire than those of other gems, yet may be saved after its being raised in vapour as other sublimed substances are; accident, and not any plan of operation, afforded this: but the fact is worth further consideration.

On unluting the crucible and opening it, the *jasper* was found melted into one lump, nearly as hard as before; but milk-white and semilopake, resembling in all respects a natural white agate. The cover and the upper parts of the crucible which were unsullied, and which could not be touched by the *jasper* in substance, were tinged with the colours that the *jasper* had lost. These had the appearance of the finest *jaspers*, but the colours were superficial

perficial onix, not penetrating into the substance of the matter. The ground was green, as in the natural *jasper*, and the variegations red and yellow, and as beautifully disposed as in the stone itself; the colours were so evenly laid also that they had a fine polish, and might have passed for wrought *jaspers* of the same species with the melted one, if cunningly set, and not suffered to be handled.

Dr. Brown, in his travels through Germany, gives an account of a mass of *jasper* dug out of a quarry at Nuremberg, and now making a part of the *pavement* of one of the emperor's courts at his palace at Vienna, which is of nine feet diameter.

From these *jaspers*, iron may be obtained: when *jaspers* are spotted with specks of onyxes, or agates, they are called JASPONYXES.

JASPICAMEO, in *Natural History*, the name of one of the semipellucid gems of the CAMEA kind, very well known among the Italian lapidaries, but very seldom seen among us. It is seldom found of any considerable size, and is composed of broad zones of a pure and elegant white, and a very delicate green, much resembling the matter of some of the green *jaspers*. It is found in the East Indies, and in some parts of America. The Italians are very fond of it, and use it as the common camea for cutting heads and other figures on, either in relief or creux.

JASPONYX, in *Natural History*, the name of the purest horn-coloured ONYX with green zones; an extremely beautiful stone. It is usually found in the shape of a small pebble, composed of a nucleus of a shattered or flawed crystal, of an irregularly angular figure, round which are alternately disposed zones of a fine pure crystalline matter lightly tinged to a horn-colour, and green ones little inferior to the emerald in beauty, being truly composed of the matter of the finest oriental JASPER, and sometimes between and among these there are fine slender zones of a pure white, which add greatly to the beauty of the stone. It is found in the East Indies and in New Spain; but in neither of those places very frequently. It is greatly esteemed among all the European nations, and cut into rose; but its scarcity has given occasion to our jewellers very frequently to put off a green veined German agate under its name. Hill's Hist. of Foss. p. 492.

JASSENES *Marmor*. See MARBLE.

JATRALIPTES, [ἰατρὸς, *a physician*, and ἀλείφω, *I anoint*], in *Antiquity*, in its original signification, was used for an officer in the gymnasia, whose employment was to anoint the athletæ. The *jatraliptes* was also called *aliptes*; both which terms were sometimes also used to denote the masters of the exercise, such as the *gymnastes* and *paidotribæ*.

IATRALIPTES is also a term used by the *Ancient Writers in Medicine*, to denote such physicians as pretended to cure all diseases by external unctions. This method of cure was called *jatraliptice*, and was first introduced into practice among the ancients by Prodicus, a native of Selymbria, and disciple of Æsculapius.

IATRALIPTIC, [ἰατραλειπτικὸν, that part of physic which cures by unguents and frictions; and the application of fomentations, plaisters, &c.

JATROCHEMIA, a term used by some writers, to express the method of curing diseases by chemical remedies.

JATROPHA, in *Botany*. See CASSADA.

JAVELIN, a kind of spear, or half-pike, used by the ancients both on horseback and on foot.

It was five feet and a half long; and the steel wherewith it was headed, had three sides, or faces, which all terminated in a point.

JAUMS, among *Carpenters*, denote the door-posts, as also the upright posts at the ends of window-frames.

JAUMS, among *Bricklayers*, &c. the upright sides of CHIMNEYS, from the hearth to the mantle-tree.

JAUNDICE, derived from the French, *jaunisse*, yellowness, of *jaune*, yellow, in *Medicine*, a disease consisting in a fusion of the bile, and a reflection thereof to the surface of the body, whereby the whole exterior habit is discoloured. Dr. Marburg is of opinion that the bile returns into the circulation in this disorder by the course of the lymphatics.

Of this there are three kinds; the first, properly called the *jaundice*, or *yellow jaundice*, is owing to the yellow bile, which, in this case, is too exalted, or too abundant in the mass of blood; or perhaps to an obstruction of the glands of the liver, which prevents the gall's being duly separated from the blood; or finally, to a stoppage of the porus biliarius, or the like means, whereby the mixture of that fluid with the aliment in the intestines is prevented.

The second, called the *black jaundice*, is owing to the same bile's being mingled with acids.

The third, bordering on *green*, takes its rise also from a different mixture of bile with an acid. This is usually called the *chlorosis*, or green sickness; and is a distemper pretty common in young women.

In the *yellow jaundice*, the albugines, or white of the eye, and the skin, are chiefly yellow; and, besides, they are troubled with an itching. In the *black jaundice*, the natural colour is lost, by reason of an atrabilary humour spread underneath the skin: it appears brownish, and often of a lead colour.

A *leucophlegmatic* proves a forerunner of the dropsy. A doctor of the faculty of Montpelier calls the *yellow jaundice*, attended with periodical pains, a *rheumatism of the liver*: and another of the same place calls it, a *quotian ague of the liver*. The acid spirit of sal ammoniac is said to be an excellent remedy against the *jaundice*.

Medical writers distinguish the *jaundice* into idiopathic and symptomatic. The idiopathic *jaundice* is that which arises of itself, and has no dependence on any other disease; the symptomatic is that which arises in the course of fevers and other distempers, in which the gall is affected.

The yellowness of the skin in some infants as soon as born, is by no means to be supposed a *jaundice*, as it is a thing of no consequence, and usually goes off of itself after voiding of the first stools: being commonly occasioned by the meconium not being sufficiently purged off.

JAUNDICE, *Signs of the*. The disease always attacks people with a remarkable lassitude, which lasts for some time; and this is more particularly the case where violent passions of the mind have given rise to the disease: this symptom is succeeded by a sense of a stricture and compression at the pit of the stomach; hence arise anxieties and straightness of the præcordia, with difficulty of breathing, which is often so violent as to threaten suffocation; and usually there is a sense of weight and uneasiness in the right hypochondrium. The patient is always sober while sitting than while lying or walking. There is a slight fever joined with the other symptoms, the patient being better than at other times, and usually feeling a slight chillness or shivering before this. The bowels are sometimes costive, but sometimes more lax than usual, and the stools are always whitish. These symptoms are very soon succeeded by a yellowness beginning in and about the eyes, and by degrees spreading itself over the whole surface of the body. The urine is of a fine yellow colour, tinging the vessels in which it stands; and if only a few drops of it are poured over a linen cloth, they immediately tinge it like saffron. The appetite is always bad; and when any thing is eaten, the uneasy sensation always returns with more violence at the pit of the stomach. The skin is dry, and the patient generally feels a kind of itching or pricking pain over the whole body. There is a heat in the nostrils, a bitter taste in the mouth, loathing of food, sickness at the stomach, vomiting, and flatulency. The sleep is usually troubled, and there is ever a great languor of the mind attending the disease through all its periods. These are the symptoms of the yellow *jaundice*.

The black *jaundice* is distinguished by a more violent and uneasy dejection and languor of the mind, and the colour brought on by the disease is blackish; and this is not only in the eyes and skin of the whole body, but also in the urine and spittle, or at least the last is of a dusky and deep yellow. To these symptoms there is joined in this case a hectic heat, with great restlessness, wasting of the flesh, and a singular and terrible dejection of the strength; and as there is usually a sensation of a pressure and weight in the right side in the *yellow jaundice*, the same sensation is felt in this on the left. Persons of all ages, and of both sexes, are subject to this disease, but particularly such as are of a choleric habit; and the extremes of life, youth and old age, are more frequently subject to it than the middle stage.

Causes of it. The immediate cause of the *jaundice* is an obstruction of the bile, in its passage into the duodenum, by gall stones, spoalm, a scirrhus, whereby it regurgitates, is absorbed by the blood and mixed with it. The remote or occasional causes are a coarse and thick diet, and an immoderate stomach for food, a sudden obstruction or repellism of hæmorrhoidal veins. In these cases this disease is also too often either the forerunner, or the attendant of an HEPATITIDES. It is also sometimes brought on by a suppression of intermittent fevers, particularly of quartans by astringents, and by violent passions of the mind, especially when they are suppressed. Violent emetics or purges will sometimes also bring on this disease, as will also a sudden draught of cold water when the body is very hot. It may be also occasioned by the bites of poisonous animals, and by the bilious or hysteric

hyſteric colic. A ſcirrhus in the liver, or a ſtone in the gall bladder, are alſo known too often to occaſion it. Theſe are the cauſes of the yellow *jaundice*; but the black uſually takes its riſe from obſtinate and habitual obſtructions of the ſpleen, which is properly the ſeat of this diſorder.

Progneſtics. Young people are ſeldom ſo violently attacked with the *jaundice* as thoſe advanced in years, and are always more eaſily cured of it. When this diſeaſe comes out with more than ordinary violence, there is reaſon to ſuſpect a bottle or ſlow fever at the bottom, or ſometimes an acute one. And when a *jaundice* attacks perſons on the fourth day of an acute fever, or before that time, and comes on with great violence, there is always danger of the death of the patient. The greater the obſtructions of the viſcera are from the ſuppreſſion of interminent fevers, the greater is the danger that attends the *jaundice* ariſing from ſuch obſtructions. People who have had the *jaundice* two or three times fall into a ſort of habitual tendency to it on different occaſions, and are uſually ſubject afterwards to frequent returns of it. When the *jaundice* is attended with great difficulty of reſpiration, anxiety, and oppreſſion about the præcordia, and with a ſlut of aſthmatic oppletion of the breaſt, a hectic or aſcites, and an atrophy, too frequently follow. If at any time the yellow colour of the ſkin in this diſeaſe changes ſuddenly to white, it is a very fatal preſage; ſhewing that there is a ſcirrhous conſtitution in the liver. A diſcharge of blood by the hæmorrhoidal veins happening in the time of this diſeaſe, is a preſage of a ſpeedy cure, and copious yellow ſweats which ſtain the linen, are alſo a very favourable ſymptom. A *jaundice* which happens to perſons advanced in years, from the too frequent uſe of ſpirituous liquors, is a much more difficult one to cure than the common kind, as there is always in this caſe a conſiderable ſcirrhus of the liver. A *jaundice* not unfrequently ariſes from a ſuppreſſion of a quartan by the bark alone, or given in an injudicious manner; and when this proves obſtinate and difficult of cure, it gives a very bad preſage of a hectic, and obſtruction of the liver. On the whole, a ſimple *jaundice* of the common ſlighter kind is eaſily cured, and is of no danger; but when this diſeaſe is complicated with others, and is obſtinate of cure, it uſually proves fatal either in itſelf, or its conſequences.

The black *jaundice* is always more difficult of cure than the yellow; and where it attacks old people, and is of long ſtanding, it generally proves fatal either in itſelf, or by bringing on hectics and other incurable diſorders.

Method of cure. When the diſeaſe is recent, the patient ſhould take three or four times a day powder of nitre and tartar vitriolated; and in caſes where violent paſſions have been the cauſe of it, the abſorbent powders are to be added, as crabs-eyes, and the like. At times there muſt be given with theſe, ſmall doſes of rhubarb or other gentle purgatives, and decoctions of turmeric, celandine, and a little ſaffron. By theſe means a recent *jaundice* is often happily taken off in a very little time, or as it were nipped in the very bud. A few grains of diaphoretic antimony may be added to that powder, which is to be taken going to reſt; and this will be very effectual in carrying off the yellowneſs of the ſkin. When the diſeaſe is going on by theſe gentle means, ſome gentle chalybeate is to be given twice a day, and after this the purging by rhubarb is to be repeated. If the patient be young, of a full ſanguine habit, and complains of pain in the right ſide, about the region of the liver, bleeding will be neceſſary, and a vomit muſt be adminiſtered; half a dram of ipecacuanha in powder, will be a ſufficient doſe for an adult, which may be waſhed off with camomile-tea, or lukewarm water. The body muſt likewiſe be kept open by taking a ſufficient quantity of Cattile ſoap, or of the PILLÆ for the *jaundice*: the ſal diureticus is an excellent attenuant and deobſtruent, and may be given from a dram to a dram and a half, three times a day. Fomenting the parts about the region of the ſtomach and liver, and rubbing them with a warm hand or flesh-brush are likewiſe beneficial; and the patient may derive great benefit from ſitting up to the breaſt in a veſſel of warm water.

When the diſeaſe is more ſtubborn, a gentle ſweat is to be kept up continually, and powder of turmeric to be given at a ſcruple for a doſe, and powders of diaphoretic antimony and the digeſtive ſalts, ſuch as tartar vitriolated, are to be given ſuppentive. Vomits may be alſo repeated, if there be no ſign of inflammation. A dram of ſoluble tartar may be taken every night and morning, in a cup of tea or water-gruel, and if it does not open the body, the doſe may be increaſed.

Lice, millepedes, &c. have been recommended for the cure of the *jaundice*; but theſe confided in to the neglect of more valuable medicines, do more harm than good: and they are ſeldom preſſided in long enough becauſe they are expected to operate as charms. Conſiderable benefit has been received in a very obſtinate *jaundice* from a decoction of hemp-ſeed. Four ounces of the ſeed may be boiled in two quarts of ale, and ſweetened with coarſe ſugar. The doſe is half a pint every morning which may be continued for eight or nine days. The waters of Bath and Harrowgate are very ſerviceable in this diſeaſe. The diet of a perſon in this diſeaſe ſhould be cool, light, and diluting, conſiſting chiefly of ripe fruits and mild vegetables. Many have been cured by living almoſt wholly for ſome days on raw eggs. The drink ſhould be butter-milk whey ſweetened with honey, or decoctions of cool opening vegetables, as marſh-mallow roots, with liquorice, &c. the patient ſhould uſe as much exerciſe as he can bear, take long journeys, purſue diverting amuſements, and uſe every means of promoting the circulation and cheering the ſpirits. In young people, there needs little more to cure the *jaundice* than the keeping up a gentle perſpiration, and a few doſes of rhubarb. Vomits, purges, fomentations, and exerciſe will ſeldom fail to cure the *jaundice*, when it is a ſimple diſeaſe; and when complicated with the dropſy, and a ſcirrhous liver, or other chronic complaints, it is hardly to be cured by any means. In caſe of a ſcirrhus, the extract of hemlock is reckoned the beſt palliative. And, in general, as the *jaundice* is a diſeaſe very ſubject to return upon perſons who have once had it, gentle evacuations ſhould be uſed at times to keep it off, and a medicated drink with rhubarb, ſenna, and the like, ſhould be taken for ſome days once in a quarter of a year. The *jaundice* is a diſeaſe which will not bear any rough methods; ſtrong purges always do harm, and ſweats forced by the hot medicines make the diſeaſe worſe, inſtead of giving the relief in it which is always had from perſpiration brought on by gentler means. Perſons ſubject to the *jaundice* ought to uſe as much exerciſe as poſſible, and avoid all heating and aſtringent aliments. Junker Conſp. Med. p. 440—445. &c. Buchan's Dom. Med. p. 495. &c.

Horſes are ſubject to this diſtemper as well as men. The farriers commonly call it the *yellows*, and divide it, as we do the *jaundice*, into two kinds, the yellow and the black. The yellow kind is known by the creature's white of his eyes turning to a yellowiſh colour, and his tongue and lips alſo partaking of the ſame tinge, but in a ſmaller degree. In the black kind all theſe parts are tinged with a darkiſh or blackiſh colour. The cure

among the farriers is by means of an ounce o

diſſolved in two quarts of ſtrong beer, and

horſe warm; and repeating this doſe once in t

as long as the diſtemper continues.

JAUNDICE-*bird*, *illurus*, in *Ornithology*, a name by which ſeveral of the old authors have called the GALBULA, a bird of the turdus kind, very beautifully coloured all over with a gold yellow, but with black wings.

JAU-RAIA, in *Botany*, a name given by Plumier to a genus of plants; another ſpecies of which he afterwards deſcribes under the name of *bryonia* ſpecies. Theſe are included by Linnæus under one genus; the characters of which are delivered in his Genera Plantarum, p. 479. under the name RAJANIA.

JAW, in *Anatomy*. See MAXILLA.

JAW, *Diſlocated*. The lower *jaw* is ſeldom luxated, becauſe it is held very firmly by ſtrong ligaments and muſcles in two ſmall pits in the baſis of the *cranium*; but when it is by accident forced from thence, whether it be to one ſide only, or on both; it is in this caſe thruſt directly forward. This accident is ſometimes brought on by a blow, or fall, but moſt frequently it happens from the opening the mouth too wide in yawning. If it be luxated on both ſides, the chin will incline downward, and the *jaw* will be thruſt very forward; but if only on one ſide, the chin will be inclined towards the oppoſite ſide; the elapſed little head of the *jaw* not being capable of diſlocation otherwiſe than forward, and inward. When the *jaw* is out only on one ſide, the cure is uſually not very difficult; but when both heads are diſlocated, and not preſently reſtored to their place, it always occaſions the worſt of ſymptoms, as pains, inflammations, convulſions, fevers, vomitings and even death at length; and theſe ſymptoms are the more violent, as the adjacent nerves, tendons, and ligaments ſuffer a greater extenſion; but if an expert ſurgeon is applied to in time, all theſe are prevented by the ends being reduced.

The patient is to be ſeated on a low ſtool, ſo that an aſſiſtant may hold his head firm back againſt his breaſt; then the ſurgeon is to thruſt his two thumbs as far back into the patient's mouth as he well can, but they are to be firſt wrapt round in a handkerchief, to prevent them either from ſlipping, or from being hurt; his other fingers are at the ſame time to be applied to the *jaw*, ex-

ternally. When he has thus firmly got hold of the *jaw*, it is to be ſtrongly preſſed, firſt downwards and then backwards, and laſtly upwards. Theſe different directions of the force are however to be given all in one inſtant; and by theſe means the elapſed heads of the *jaw*, are at once reſtored into their former cavities; but the ſurgeon muſt alſo be very careful always to ſnatch his thumbs very ſwiftly out of the patient's mouth, leſt they ſhould be compreſſed, bruiſed, or bit by reducing the *jaw*.

If the *jaw* be out on one ſide only, the method of reducing it muſt be exactly the ſame, only that the luxated ſide muſt be forced more ſtrongly downward and backward, than the ſound one. As to bandages, there is no occaſion for them in this caſe, unleſs the luxation has remained ſome time before it was reduced; for in that caſe, it may not be improper to apply, for ſeveral days, the four-headed bandage, with ſome ſtrengthening ſpirit; which may be taken off, when the patient intends to eat. Heiſter's Surg. p. 152.

We have a method, by Mr. Monro, of reducing the *jaw*-bone when luxated: who ſays, he has more than once found Mr. Petit's method of reducing the luxated *jaw*-bone ineffectual, after the muſcles have been ſwelled by unſucceſsful attempts of reduction, but that he ſucceeded by a ſmall improvement; which was to wrap linen ſo thick round his two thumbs, that he could ſcarce introduce them betwixt the poſterior grinders; then taking hold of the baſe of the *jaw*, with his fingers, and applying his palms under the chin, he preſſed down and pulled forward the poſterior part of the *jaw* with his fingers and the points of his thumbs, which is the whole of M. Petit's method; and at the ſame time he thruſt the anterior part of the *jaw* upwards with his palms, ſo that the *jaw* being made uſe of as a lever to which the laſt joint of the thumbs ſerved as a prop, he acquired a conſiderable force, to which the muſcles were obliged to yield, and the condyles were entirely diſengaged from the zygoma, and brought down; after which they ſlide backwards with the leaſt aſſiſtance, and the reduction is fully made.

When the thumbs have not force enough to make the reduction, Dr. Simpſon, profeſſor of medicine at St. Andrew's, made uſe of a round piece of wood, eight or nine inches long, one end of which is cut into the form of a wedge, to introduce it between the teeth of the luxated ſide with the thinneſt part, as far back as the poſterior grinders; when, having the head ſecured and reſting the chin, he puſhes the other end of the wood upwards, to depreſs the back part of the *jaw* with the thin end, by which the force is much greater than the thumbs can exert.

This learned profeſſor thinks the common opinion, that the *jaw* is brought down by the force of the *digaſtric* muſcles ſolely, not ſufficiently founded. Med. Eſſ. vol. i. art. 11. and vol. iii. art. 13.

Fractures of the JAW. The lower *jaw* is not ſo liable to fractures as the reſt of the bones; but when it is broke, whether it be on one ſide or both, the divided parts do not recede to any diſtance from one another. For the reſtoring the bones in a fractured *jaw* to their proper ſituation, the patient muſt be commodiouſly ſeated over againſt the light, and his head held firm by an aſſiſtant. The ſurgeon is then to introduce the thumb or fore-finger of one hand into the mouth, applying the other externally; and by this means he is to preſs the fragments of the *jaw* on each ſide, till they have regained their former ſituation; which may be always known by the regular diſpoſition of the teeth. And if any of the teeth be found looſe or ſlipped out, it may not be improper, if nothing hinders, to reſtore them afterwards to their proper places; faſtening them by a ſilver wire to ſuch as are next them. After the bones are thus properly reduced, they muſt be covered firſt with a plaiſter, and then a compreſs dipt in ſpirit of wine, and applied internally; and another compreſs ſewed to a piece of paſteboard of the form of a half *jaw*, is to be laid on externally; theſe are to be kept on by a four-headed bandage, perforated in the middle to let in the chin. But when the *jaw* is found to be fractured on both ſides, it is uſual to introduce and apply internally, after the compreſs dipt in ſpirit of wine, another made of thin paſteboard; perforated in its middle, and accommodated to the figure of the chin in this manner. Its middle that is perforated, is to be applied to the chin, and its two extremities towards the ears. But fractures of this part may often be well enough cured without plaiſters and ſplints, where we can conveniently apply a proper bandage; for theſe bones are not eaſily diſplaced again, when they are once reduced. The patient muſt for ſome days live upon liquids, avoiding chewing and talking; and the fracture is generally well in twenty or thirty days. Heiſter's Surg. p. 119.

Locked Jaw is a ſpaſmodic contraction of the lower *jaw*, commonly produced by ſome external injury affecting the tendons or ligaments, and belonging to the claſs of diſtempers called EMPROSTHOTONOS, OPISTHOTONOS and TETANUS. Opiates adminiſtered in large doſes, and for a conſiderable time, are the only medicines that inſure relief in this diſorder. The warm bath and muſk have alſo been found of ſervice. See an account of a variety of caſes, with the method of treatment in the London Med. Obſ. &c. vol. i. art. 1. art. 7. vol. ii. art. 8. art. 34. vol. iii. art. 31. vol. iv. art. 7.

JAY, in *Ornithology*, is the Engliſh name of the CORVUS *glandarius* of Linnæus, with the upper feathers of the wings blue, variegated with black and white; the chin is white, and at the angle of the mouth are two large black ſpots; the forehead is white, ſtreaked with black; the head is covered with very long feathers, which the bird can erect at pleaſure into the form of a creſt; the whole neck, back, breaſt, and belly, are of a fine purple daſhed with grey; the rump is white; the tail conſiſts of twelve black feathers; the feet are of a pale brown; the claws large and hooked. The jay lays five or ſix eggs, in a neſt formed of the fibres of roots of trees placed on cone ſticks. The young follow their parents till the ſpring; in ſummer theſe birds are very injurious to gardens, and in autumn and winter feed on acorns. The *jay* is one of the moſt beautiful of the Britiſh birds; it is very docile, and may be taught to imitate the human voice. When it is catching at fledged young to follow it, the noiſe it makes is like the mewing of a cat. Pennant. See *Tab.* III. *Birds*, N° 24.

IBERIA, in *Ancient Geography*, the name by which Spain was anciently known, as well as Georgia in Aſia.

IBERIS, in *Botany*. See *Sciatica* CRESSES and DITTANDER.

IBEX, in *Zoology*, the name of an animal of the GOAT kind. It is found in the mountains, and is extremely ſwift; but carries on its head a pair of large knotted horns, reclining backwards. Bellonius obſerves that he ſaw ſome whoſe horns were four cubits long: they are bent down upon the back, and are wreathed and knotty, one knot growing every year. The head is ſmall, and the legs very ſlender, ſo that this creature, though properly of the goat kind, much reſembles a ſtag: the male has a very long black beard. It is not uncommon in ſome parts of Germany. It inhabits the higheſt Alps of the Griſons country, and it is alſo found in Crete. The chace of this animal is very dangerous: its blood has been much eſteemed in pleuriſies. The tame ſpecies ſprung from this ſtock.

IBIBIBOCA, in *Zoology*, the name of a ſpecies of ſerpent called by the Portugeſe COBRA *de veado*. It is about two feet in length, and of the thickneſs of a man's thumb; and tapers off at the tail to a thinneſs, till at laſt it ends in a ſharp point. Its belly is all over white, and very bright and gloſſy; and its head is covered with white ſcales of a cubic figure, and with ſome black ones towards the edges. Its body is variegated with black, white, and red. It is a very ſlow mover; but is of a very terrible and poiſonous kind. Ray.

IBIGA, in *Botany*, a name uſed by ſome authors for the chamæpitys, or ground-pine.

IBIJARA, in *Zoology*, the name of an American ſpecies of ſerpent, called alſo *boiry* and by the Portugeſe, *cega, cobre vega*, and COBRA *de las cabeças*. It is of the amphiſbena kind, and is generally ſaid to have two heads, one at each end; but that is wholly erroneous. The head and tail are of the ſame ſhape, and of equal thickneſs, and the creature will ſtrike equally with either; and, as it is ſaid, its poiſon is equally contained at both. It is a ſnake of the ſmaller kind, being of about a foot long, and as thick as one's finger. It is white in colour, and as ſhining and gloſſy as glaſs; and is very elegantly marked with rings and ſtreaks of a brown or copper colour. Its eyes are ſmall and ſcarce conſpicuous, looking only like dots made by the point of a needle; it lives under ground, and feeds on ants and other ſmall inſects. It is often thrown up in digging; and the Portugueſe ſay, it is a creature whoſe poiſon is beyond the reach of all the known remedies. Ray.

IBIJAU, in *Ornithology*, the name of a Braſilian bird, of the caprimulgus, or goat-ſucker kind. It is a very beautiful little owl, not larger than a ſwallow. Its head is large, broad, and flat, and its eyes black and very lively; its beak is extremely ſmall, not exceeding the ſize of the large ſting of a ſpider; but at the top of this, the noſtrils are very diſtinguiſhable. Its mouth is monſtrouſly large; when ſhut this is not perceived, but when it is open, it reaches each way to the eyes. Its legs are very

short, and its tail broad. It is all over of a blackish colour, speckled and variegated with white and yellow. Margrave.

IBIRA, in *Botany*, a name given by some authors to the tree which produces the cubebæ, or CUBEBS of the shops.

IBIRACOA, in *Zoology*, the name of a species of serpent, found in the West-Indies; whose bite is always attended with very terrible effects. It is of a variegated colour, mottled with black, white, and red.

IBIS, in *Ornithology*, the name of an Egyptian bird, approaching to the stork-kind; and by some confounded very erroneously with the hæmatopus, or red-legged heron. It is all over of a fine flaming black; its beak is long, somewhat hooked, and all over of a fine red, as are also its legs, which are as long as those of the bittern; its neck is as long as that of the common heron. It is said to be peculiar to Egypt, and is there very serviceable in destroying the serpents, locusts, and other devouring insects; and hence it was, that, in early ages, they had divine honours paid them.

It is remarkable with regard to this bird, that although it lives principally about the Nile, yet it never enters the water, nor can it swim. The nic of plinters is said to have been learned from the ibis, and not from the stork. It generally builds its nest upon palm-trees, to avoid the cats. Aldrovandus relates, that the flesh of the ibis is red, like a salmon's; that it is sweet; that its skin is very hard, and smells like wild-fowl.

IBITIN, in *Zoology*, the name of a very large and dangerous serpent in the Philippine isles. This animal twists its tail round the trunk of a tree, and strikes its prey, as men, deer, &c. which it entirely devours, and then squeezes itself against the tree, in order to digest what it has eaten.

IBUM. The Robbins gave this name to the ceremony of a brother's marrying his father-in-law, the widow of his brother, deceased without children, by virtue of the Mosaic law mentioned in Deut. xxv.

ICADES, the name of an ancient feast, celebrated every month by the Epicurean philosophers, in memory of their master Epicurus.

The day on which it was held, was the twentieth day of the moon, or month, which was that whereon Epicurus was born, and hence came the name *icades*, from εικας, *twenty*.

They adorned their chambers on this day, and bore his image in state about their houses, making sacrifices, &c.

ICE, a brittle transparent body, formed of some fluid, frozen or fixed by COLD. See FREEZING and FROST.

The specific gravity of *ice* to water, is as eight to nine; hence, being lighter than water, it floats upon it. The specific gravity of *ice* was tried by Dr. Irving, in Phipps's voyage to the north pole; who found, that when a piece of the most dense *ice* which he could meet with, was immersed in snow-water, the thermometer 34°, fourteen fifteenth parts sunk under the surface of the water; in brandy just proof, it barely floated; in rectified spirits of wine, it fell to the bottom at once and dissolved immediately. This rarefaction of *ice* is owing to the air-bubbles produced in *ice* while freezing; these, being confusedly large in proportion to the water frozen, render the *ice* so much specifically lighter. It is well known, that a considerable quantity of air is lodged in the interstices of water, though it has not there any elastic property, on account of the dissunion of its particles; but these particles coming closer together, and uniting as the water freezes, light, expansive, and elastic air-bubbles are thus generated, and increase in bulk as the cold grows stronger; whence of course the *ice* grows lighter, and these air-bubbles acquiring an elastic force burst to pieces any vessel in which the water is closely contained. But snow-water, or any water long boiled over the fire, affords an *ice* more solid than ordinary, and with fewer bubbles. Pure water long kept in vacuo and frozen afterwards there, freezes much sooner, on being exposed to the same degree of cold, than water unpurged of its air and set in the open atmosphere. And the *ice* made of water thus divested of its air, is much harder, more solid and transparent, and more ponderous than common *ice*. See FREEZING and FREEZING-*mixture*.

Mr. de Marian, in a dissertation on *ice*, attributes the increase of the bulk of the water under this form, principally to a different arrangement of its parts: the icy skin on water, being composed of filaments which are found to be joined constantly and regularly at an angle of 60°, and which, by this disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, and in different trials a 14th, an 18th, a 19th, and when the water was previously purged of air, only a 22d part. Besides, *ice* after its formation continues to expand by cold; a piece of *ice*, which was at first only a fourth part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter; and thus he accounts for the bursting of *ice* in ponds.

To make the most perfect *ice* we should take the purest water, and perfectly purge it of its air by the air-pump; then freeze it in the severest frost, by means of Mr. Farenheit's contrivance. Thus we obtain an *ice* of the greatest hardness, density, purity, transparence, and gravity.

It appears by an experiment of Dr. Hooke in 1663, that *ice* refracts the light less than water; whence he infers, that the lightness of *ice*, which causes it to swim in water, is not produced merely by the small bubbles which are visible in it, but that it arises from the uniform constitution or general texture of the whole mass. This fact was afterwards confirmed by M. de la Hire. Hooke's Exper. by Derham, p. 26. Acad. Par. 1693. Hem. p. 25.

Ice is known to evaporate as well as water, and, some say, in a greater degree.

In the mountains of Switzerland there are immense masses of *ice*, which, by the tradition and histories of the country, must have lain there many centuries. At certain times there happen cracks in them, and by these cracks the vast thickness of the masses may in some measure be guessed at; some of them being three or four hundred ells deep, and yet none of them ever having gone through the whole thickness.

The vast bodies of *ice* met with in the northern seas near Hudson's Bay, are surprising; some of them being immersed a hundred fathoms or more under the surface of the ocean, and a fifth or sixth part above, and three or four miles in circumference. See Phil. Trans. N° 465. sect. 2.

These floating mountains of *ice* owe their vast bigness and durable nature to a cause not considered by many; that is, to their not being common *ice*, but the *ice* of sea-water; many experiments proving, that in acid and spirituous liquors, when the froft has power over them, the watery parts only are affected, and the *ice* is tasteless, while the liquor remains concentrated, and much stronger than before at the bottom, or in the center. It was generally supposed that the saline liquors, and consequently sea-water, were affected by freezing in the same manner that is, its watery part alone was frozen, and the salt separated from the part so congealed; but Dr. Lister proved, that the *ice* formed of SEA-WATER is salt, and does contain sea-salt, and finally that by means of this salt contained in it, rendered [illegible] than common *ice*. If a vial of salt-water be exposed to the air in frosty weather till flakes of *ice* appear in it, and then brought into a warm room, these flakes will remain even in that place a long time undissolved; and if they are taken out and exposed at a small distance to the fire, they will not run into water as common *ice* would, but they will by degrees evaporate, and there will be left only a little white salt.

Since sea-water, when frozen, thus forms a very durable *ice*, it appears easy to conceive, that the immense masses of such *ice* found in the northern seas should continue undissolved through the whole year, and at the return of the freezing season remaining of the same bigness as at first, they must of consequence then become much bigger by the freezing of more *ice* about them; and thus continuing to lose very little, and that only by accidents, and annually to increase a great deal, it is not wonderful that they become so large. Phil. Trans. N° 167. p. 836. See *Sea-*WATER.

But there have been different opinions with regard to the origin of those vast piles of *ice*, resembling whole islands, in the northern regions. Some ascribe them to snow, which, falling in great abundance, in those cold climates and melting in the sea, accumulates gradually, till those huge heaps are at length formed; but the more common opinion is, that this *ice* is formed from the fresh waters which flow from the neighbouring lands. It is certain that great quantities of floating *ice* are discharged by the river Oby, and kept in a state of constant agitation by it. Bartoli has written an Italian treatise expressly on *ice* and *congelation*. And the Acta Eruditorum furnish us with an account of a French author on the same subject. See COAGULATION, and COLD, and CRYSTALLIZATION.

Sir Robert Barker has particularly described the process of making *ice* in the East Indies, where, during his stay, he has never seen any natural *ice*. For this purpose they dig, on a large open plain, three or four pits, about thirty feet square, and two deep each; the bottoms of which they cover about eight inches or a foot thick with fugar-cane or the ftems of the large Indian corn, dried. On this bed are placed in rows a number

ber of ſmall ſhallow unglazed earthen pans, formed of a very porous earth; a quarter of an inch thick, and about an inch and a quarter deep; which, at the duſk of the evening, they fill with ſoft water that had been boiled. In the morning before ſun-riſe, the *ice*-makers attend at the pits and collect what was frozen in baſkets, which they convey to the place of preſervation. This is generally prepared on ſome high dry ſituation, by ſinking a pit fourteen or fifteen feet deep, lining it firſt with ſtraw, and then with a coarſe kind of blanketing. The *ice* is depoſited in this pit and beat down with rammers, till at length its own accumulated cold again freezes it, and forms one ſolid maſs. The mouth of the pit is well ſecured from the exterior air with ſtraw and blankets, and a thatched roof is thrown over the whole. The quantity of *ice* formed by the method above deſcribed depends on a light atmoſphere, and clear ſerene weather. Phil. Tranſ. vol. lxv. p. ii. art. 22.

Ice *bergs* are large bodies of *ice* filling the valleys between the high mountains in northern latitudes; the face of which towards the ſea is nearly perpendicular, and of a very lively light green colour. Some of theſe are at leaſt three hundred feet high.

Ice, *blink of the*, is a name given by the pilots to a bright appearance near the horizon occaſioned by the *ice*, and obſerved before the *ice* itſelf is ſeen.

Ice-*cream*, *method of making*. Take a ſufficient quantity of cream, and, when it is to be mixed with raſpberry, or currant, or pine, a quarter part as much of the juice or jam as of the cream: after beating and ſtraining the mixture through a cloth, put it with a little juice of lemon into the mould, which is a pewter veſſel, and varying in ſize and ſhape at pleaſure; cover the mould, and place it in a pail about two-thirds full of *ice*, into which two handfuls of ſalt have been thrown; turn the mould by the hand-hold with a quick motion to and fro, in the manner uſed for milling chocolate, for eight or ten minutes; then let it reſt as long, and turn it again for the ſame time; and having left it to ſtand half an hour, it is fit to be turned out of the mould, and to be ſent to table.

Lemon juice and ſugar, and the juices of various kinds of fruits, are frozen without cream, and when cream is uſed, it ſhould be well ſtirred.

Ice-*houſe*, a repoſitory for ice during the ſummer months. The aſpect of *ice-houſes* ſhould be towards the eaſt or ſouth-eaſt, for the advantage of the morning ſun to expel the damp air, as that is more pernicious than warmth; for which reaſon, trees in the vicinity of an *ice-houſe* tend to its diſadvantage.

The beſt ſoil for an *ice-houſe* to be made in is chalk, as it conveys away the waſte water without any artificial drain; next to that, looſe ſtony earth, or gravelly ſoil. Its ſituation ſhould be on the ſide of a hill, for the advantage of entering the cell upon a level, as in the drawing, *Tab.* II. *Miſcellany*, *fig.* 23.

To conſtruct an *ice-houſe*, firſt chooſe a proper place at a convenient diſtance from the dwelling-houſe or houſes it is to ſerve; dig a cavity (if for one family, of the dimenſions ſpecified in the deſign) of the figure of an inverted cone, ſinking the bottom, concave, to form a reſervoir for the waſte water till it can drain off; if the ſoil requires it, cut a drain to a conſiderable diſtance, or ſo far as will come out at the ſide of the hill, or into a well, to make it communicate with the ſprings, and in that drain form a *flint* or *air-trap*, marked *l*, by ſinking the drain ſo much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will conſequently be in the trap; and will keep the well-air tight. Work up a ſufficient number of brick piers to receive a cart wheel, to be laid with its convex ſide upwards to receive the *ice*; lay hurdles and ſtraw upon the wheel, which will let the melted *ice* drain through, and ſerve as a floor. The ſides and dome of the cone are to be nine inches thick; the ſides to be done in ſtreaked brick-work, i. e. without mortar, and wrought at right angles to the face of the *work*: the filling in behind ſhould be with gravel, looſe ſtones, or brick-bats, that the water which drains through the ſides may the more eaſily eſcape into the well. The doors of the *ice-houſe* ſhould be made as cloſe as poſſible, and bundles of ſtraw placed always before the inner door to keep out the air.

Deſcription of the parts referred to by the letters.

a Thraſline firſt dug out.
b The brick circumference of the cell.
c The diminution of the cell downwards.
d The leſſer diameter of the cell.
e The cart wheel, or joiſts and hurdles.
f The piers to receive the wheel or floor.
g The principal receptacle for ſtraw.
h The inner paſſage, } each of theſe paſſages have a *fo-*
i The firſt entrance, } *ror ate* door.
k The outer door, }
l An air-trap.
m The well.
n The proſile of the piers.
o The *ice* filled in.
p The height of the cone.
q The dome worked in two half-brick arches.
r The arched paſſage.
s The door-ways inſerted in the walls.
t The floor of the paſſage.
u An aperture through which the *ice* may be put into the cell; this muſt be covered next the crown of the dome, and then filled in with earth.
v The ſloping door, againſt which the ſtraw ſhould be laid.

The *ice*, when to be put in, ſhould be collected during the froſt, broken into ſmall pieces, and rammed down hard in ſtrata of not more than a foot, in order to make it one complete body; the care in putting it in, and well ramming it, tends much to its preſervation.

In a ſeaſon when *ice* is not to be had in ſufficient quantities, ſnow may be ſubſtituted.

The editor is indebted for this deſcription and drawing of an *ice-houſe* to the friendly communication of Mr. Blackburn, an ingenious architect.

Ice may be preſerved in a dry place under ground, by covering it well with chaff, ſtraw, or reeds. Phil. Tranſ. N° 84. p. 140. See Snow.

Great uſe is made of chaff in ſome places of Italy to preſerve *ice*. The *ice-houſe* for this purpoſe need only be a deep hole dug in the ground on the ſide of a hill, from the bottom of which they can eaſily carry out a drain, to let out the water which is ſeparated at any time from the *ice*, that it may not melt and ſpoil the reſt. If the ground is tolerably dry, they do not line the ſides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole: this pit they fill either with pure ſnow, or elſe with *ice* taken from the pureſt and cleareſt water; becauſe they do not uſe it as we do in England, to ſet the bottles in, but really mix it with the wine. They firſt cover the bottom of the hole with chaff, and then lay in the *ice*, not letting it any where touch the ſides, but ramming in a large bed of chaff all the way between: they thus carry on the filling to the top, and then cover the ſurface with chaff, and in this manner it will keep as long as they pleaſe.

When they take any of it out for uſe, they wrap the lump up in chaff, and it may then be carried to any diſtant place, without waſte or running. Phil. Tranſ. N° 8. See Ice.

Ice-*plant*, a very ſingular and beautiful plant of the *ficoides* kind, called by Mr. Tournefort, *ficoides Africana folio plantaginis undulato minis argenteis conſperſo*, or the African ficoides with a waved plantain-like leaf, and covered with ſilver drops. It is alſo commonly called with us the diamond-plant, and the froſt-plant, from its leaves and ſtalks being all over beſet with tranſparent cryſtal-like drops, as if covered over with ſmall icicles. This is a ſpecies of the *fig-marygold*, or Mesembryanthemum. The ſeeds of this plant are to be ſown very early in the ſpring upon a good hot-bed; when the plants are come up they are to be tranſplanted into ſmall pots, filled with freſh light ſandy earth, and plunged into another hot-bed; as that hot-bed declines in heat they ſhould be moved into a third, and this will bring them forward toward flowering. In July theſe plants may be expoſed by degrees to the open air, and ſoon after this their flowers will appear. If it is deſired to have theſe plants very large, they ſhould be ſhook out of their pots into an old hot-bed of tanners bark, in which their roots will extend every way, and the branches in proportion; ſo that a ſingle plant will ſometimes ſpread to a yard ſquare, and its leaves and branches grow to a very ſurpriſing ſize. The flowers of this ſpecies are of no great beauty, but its *ice*-like appearance in the midſt of ſummer is ſo ſingular, as to make it very univerſally admired.

Icele, in *Mythology*, the ſon of Sleep, according to the fable, and brother of Morpheus, who is ſaid to have the power of changing himſelf into a variety of forms; *varias imitantia formas ſomnia, deluſæ mentis imago.* Ovid. Met. lib. ii. c. 630.

Ich-dien, the motto of the arms of the prince of Wales, ſignifying in High Dutch, *I ſerve*.

Sir Henry Spelman judges it to be Saxon, *Ic thien*; the Saxon *d*, with a tranſverſe ſtroke, being the ſame with *th*; and ſignifying, *I ſerve*, or *am a ſervant*, as the miniſters of the Saxon kings were called *thiens*, or *thanes*. See Crowns of *Britiſh Princes*.

Ichneumon, in *Zoology*, the name of an animal of which there have been a multitude of idle and fabulous things aſſerted: it is a creature of the viverra kind in the Linnæan ſyſtem with a longer and narrower body than a cat, and ſomething approaching both in ſhape and colour to the badger. Its noſe is black and ſharp, like

like that of the ferret. It has no beard or whiskers; its nose is prominent; its ears short and round; and its eyes flame-coloured; its colour is a yellowish grey, much like that of some of the monkey clafs. This is its appearance when in a good humour; but when frighted or provoked, it raises its hairs upright, and shews them variegated at intervals with grey and yellow in diftinct proportions; its legs are fhort, and its feet have all five toes; its tail is very long, and thick at the infertion; its teeth and its tongue like thofe of the cat; and what is very fingular is, that in both fexes it has a large aperture fituated below the anus, which it dilates and contracts at pleafure. Hence came the old opinion, that both male and female conceived, and brought forth young in this animal. Its fize is from twenty-four to forty-two inches long, from the tip of the nofe to the end of the tail. When it fleeps, it brings its head and tail under its belly, appearing like a round ball, with two legs fticking out. It is naturally a very cleanly animal, and is very bufie and nimble, and of great courage. It will engage a large dog; and if it have a quarrel with a cat, will deftroy that creature by three bites on the throat. Its nofe is fo fharp and narrow, that it can very haftily lay hold of any thing large with its teeth, and can fcarce bite a man's clenched fift. It is very expert in feizing its prey; it ftands erect on its hinder legs to defcry where it is, then throwing itfelf flat on its belly, crawls very flily towards it, and when within reach, darts violently upon it. It feeds indifferently on all animals that it can get at. Its common food are the fnail, the lizard, the chamelion, fuch ſerpents as it can manage, frogs, rats, and mice; it is alfo very fond of birds, and of none fo much as the fowl and chicken, and will feign itfelf dead till they come within reach.

It is much valued in Egypt for deftroying ſerpents, which it feizes very ſkilfully by the throat, and is kept tame in the houſes, as the cat with us. The people call it Pharaoh's rat, and the peaſants frequently bring its young to market. It is a great deſtroyer of the eggs of crocodiles, which it digs out of the ſand, and even kills multitudes of the young of thoſe terrible reptiles; ſo that it was not without reaſon that it was ranked by the Egyptians in the claſs of their deities. *Tab.* III. *Quadrupeds*, N° 24.

ICHNEUMON-*waſp*, the name given by the old writers on inſects to the ſmall ſlender-bodied waſp, which is frequently found about mud walls, and dry banks of earth. It is very different from the fly ſimply called the *ichneumon* of which there are numerous ſpecies. This is a true waſp, and is mottled with black and yellow in the manner of the common waſp. See VESPA-*Ichneumon*.

ICHNEUMON-*fly*, in the Linnæan *Syſtem* is a genus of the *hymenoptera* claſs of inſects; comprehending no leſs than ſeventy-ſeven ſpecies.

The characters of this genus are, that the mouth has jaws without a tongue; the joints of the antennæ are more than thirty; the abdomen is for the moſt part petiolated, and the ſting is thruſt out of a cylindric bivalve ſheath. Some of the ſpecies of this genus have a whitiſh SCUTELLUM, and the antennæ are annulated with a whitiſh belt. Others have a whitiſh *ſcutellum*, with the antennæ wholly black; and others again have the *ſcutellum* of the ſame colour with the thorax, and the antennæ either annulated with a belt, or black and briſtly. The ſpecies of *ichneumon* live chiefly in their caterpillar ſtate, in the bodies of other inſects, particularly of the CATERPILLARS of moths and butterflies, in which they depoſit their eggs. See CATERPILLAR-*eaters*, and Phil. Tranſ. N° 76.

ICHNOGRAPHY, in *Perſpective*, the view of any thing cut off by a plane parallel to the horizon, juſt at the baſe or bottom of it.

The word is derived from the Greek ἰχνος, *veſtigium*, *footſtep*, and γραφω, *ſcribo*, *I deſcribe*; as being a deſcription of the footſteps or traces of a work.

Ichnography is the ſame with what is otherwiſe called the *plan*, *geometrical plan*, or *ground-plot*, of any thing, and is oppoſed to ORTHOGRAPHY or ELEVATION. See alſo SCENOGRAPHY and STEREOGRAPHY.

ICHNOGRAPHY, in *Architecture*, is a tranſverſe ſection of a building, exhibiting the circumference of the whole edifice, and of the ſeveral rooms and apartments in the given ſtory; together with the thickneſs of the walls and partitions; the dimenſions of the doors, windows, and chimneys; the projectures of the columns and piers, with every thing viſible in ſuch a ſection.

The drawing or deſigning of this is properly the work of the maſter-architect, or ſurveyor; it being, indeed, the moſt difficult of any.

ICHNOGRAPHY, in *Fortification*, denotes the plan or repreſentation of the length and breadth of a fortreſs; the diſtinct parts of which are marked out, either on the ground itſelf, or upon paper.

ICHOGLANS, the grand ſeignior's pages, ſerving in the ſeraglio.

The word, according to ſome authors, is compoſed of the two Turkiſh words ich, or *ichi*, which ſignifies *within*, and oglan, *page*. In which ſenſe *ichoglan* is a page ſerving within inſide the palace, or ſeraglio. Others derive it from the barbarous Greek ιχωλη, or ιχωλα; which was formed from the Latin *incola*. Theſe two etymologies give nearly the ſame ſenſe to *ichoglan*, taking *incola* for *domeſticus incola*.

Theſe are the children of Chriſtians, and bred up in an auſterity ſcarce to be conceived. The ſultan preferes them to offices more or leſs conſiderable, as they appear more or leſs capable, and devoted to his ſervice; but it is to be obſerved, they are incapable of offices till forty years of age, unleſs they have ſome particular diſpenſation from the grand ſeignior. They are educated with a great deal of care in the ſeraglios of Perſia, Adrianople, and Conſtantinople. They are under the direction of a capi aga, who preſides over their exerciſes, and treats them with great ſeverity. They are divided into four *odas*, or chambers, where, according to their ſeveral talents or inclinations, they are inſtructed either in the languages, religion, or exerciſes of the body.

ICHOR, Ιχωρ, ſignifying any *humour*, or *humidity*, properly denotes a thin, watery humour, like ſcum; but is ſometimes alſo uſed for a thicker kind, flowing from ulcers; called alſo SANIES.

ICHTHYOCOLLA, Ιχθυοκολλα, formed of ιχθυς, *fiſh*, and κολλα, *glue*, popularly called *iſinglaſs*, or *iſſinglaſs*, is a ſolid gluttinous ſubſtance, prepared from a fiſh of the STURGEON kind, caught in the rivers of Ruſſia and Hungary. The *beluga* affords the beſt; but the ſounds of all freſh-water fiſh yield, more or leſs, fine iſinglaſs; particularly the ſmaller ſorts, found in prodigious quantities in the Caſpian ſea, and ſeveral hundred miles beyond Aſtracan, in the Wolga, Yaik, Don, and even as far as Siberia. It is alſo well known, that our lakes and rivers in North America are ſtocked with immenſe quantities of fiſh, ſaid to be of the ſame ſpecies with thoſe in Muſcovy, and yielding the fineſt iſinglaſs. The production of iſinglaſs requires no artificial heat, neither is the matter diſſolved for this purpoſe, as it has been generally imagined: for, as the continuity of its fibres would be deſtroyed by ſolution, the maſs would become brittle in drying, and ſnap ſhort aſunder, which is always the caſe with glue, but never with iſinglaſs. The latter, indeed, may be reſolved into glue with boiling water, but the viſcous recompoſition would be found unpracticable afterwards, and a fibrous texture in one of the moſt conſiſting characteriſtics of genuine iſinglaſs. Nothing more than certain membraneous parts of fiſhes, diveſted of their native mucoſity, rolled and folded into different forms, and dried in the open air. The ſounds or air-bladders of freſh-water fiſh, in general, are preferred for this purpoſe; as being the moſt tranſparent, delicate, flexible ſubſtances. Theſe conſtitute the fineſt ſorts of iſinglaſs; thoſe called book and ordinary ſtaple are made of the inteſtines, and probably the peritoneum of the fiſh. The ſounds, which yield the finer iſinglaſs, conſiſt of parallel fibres, and are eaſily rent longitudinally; but the ordinary ſorts are found compoſed of double membranes, whoſe fibres croſs each other obliquely, reſembling the coats of a bladder. Iſinglaſs receives its different ſhapes in the following manner: the parts of which it is compoſed, particularly the ſounds, are taken from the fiſh while ſweet and freſh, ſlit open, waſhed from their ſlimy feces, diveſted of every thin membrane which inveſopes the ſound, and then expoſed to ſtiffen a little in the air. In this ſtate they are formed into rolls about the thickneſs of a finger, and in length according to the intended ſize of the ſtaple; a thin membrane is generally ſelected for the outer of the roll, round which the reſt are folded alternately, and about half an inch of each extremity of the roll is turned inwards. Having thus ſettled the proper dimenſions, the two ends of what is called the ſhort ſtaple are pinned together with a ſmall wooden peg; the middle of the roll is then preſſed a little downwards, which gives it the reſemblance of a heart, and thus it is laid on boards, or hung up in the air to dry. The ſounds, which compoſe the long ſtaple, are larger than the former; but the operator lengthens this ſort at pleaſure, by inter-folding the ends of one or more pieces of the ſound with each other. The extremities are faſtened with a peg like the former; but the middle part of the roll is bent more conſiderably downwards, and, in order to preſerve the ſhape of the three obtuſe angles thus formed, a piece of round ſtick is faſtened in each angle with ſmall wooden pegs, in the ſame manner as the ends. In this ſtate it is permitted to dry long enough to retain its form, when the pegs and ſticks are taken out, and the drying completed. Laſtly, the pieces of iſinglaſs are joined together in rows, by running packthread

thread through the peg-holes, for the convenience of package and exportation.

The membranes of the book sort, being thick and refractory, will not admit the same formation; and, therefore, the pieces, after their sides are folded inwardly, are bent in the centre, in such manner, that the opposite sides resemble the cover of a book, whence its name; a peg, run across the middle, fastens the sides together, and thus it is dried like the former. The cake isinglass is formed of the bits and fragments of the staple sorts, put into a flat metalline pan, with a very little water, and heated just enough to make the parts cohere like a pan-cake when it is dried: but this is of little value.

Isinglass is best made in the summer, as frost gives it a disagreeable colour, deprives it of its weight, and impairs its gelatinous principle.

The sounds of cod and ling bear a general likeness to those of the sturgeon kind of Linnæus, and are used for the same purpose. The Newfoundland and Iceland fishermen split open the fish as soon as taken, and throw the back-bones, with the sounds annexed, in a heap; but previous to putrefaction, the sounds are cut out, washed from their slime, and salted for use. In cutting out the sounds, the parts between the ribs are left behind, which are much the best; the Iceland fishermen are so sensible of this, that they beat the bones upon a block with a thick stick, till the *pockets*, as they term them, come out easily, and thus preserve the sound entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water, before they are prepared for isinglass. The fresh sound must then be laid on a block of wood, whose surface is a little elliptical, to the end of which a small hair-brush is nailed, and with a saw-knife the membranes on each side of the sound must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with scissars, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water, in order to absorb their oily principle; and lastly, in clear water. They are then laid upon nets to dry in the air; but, if intended to resemble foreign isinglass, the sounds of cod will only admit of that called book; but those of ling of both shapes. The thicker the sounds are, the better the isinglass, excepting in colour; but that is immaterial to the brewer, who is its chief consumer. See Mr. Jackson's Account of the Discovery of the Manufacture of Isinglass, in Phil. Trans. vol. lxiii. part 1. p. 1, &c.

Ichthyocolla, or isinglass, is one of the purest and finest of the animal glues, of no particular smell or taste. Beaten into threds, it dissolves pretty readily in boiling water or milk, and forms a gelatinous substance, which yields a mild nutriment, and proves useful medicinally in some disorders arising from a sharpness and colliquation of the humours. A solution of it in water, cautiously spread, whilst hot, upon silk, affords an elegant sticking-plaster for slight injuries of the skin, not easily separable from the part by water, and scarcely inferior to the more compounded one sold under the name of the ladies sticking-plaster, in which different balsams and resins are joined to the *ichthyocolla*. See Emplastrum *adhæsivum*. Lewis's Mat. Med.

Isinglass is used in miniature painting, in the same manner as the gum Arabic or Senegal, for rendering water a proper vehicle, by giving it a due viscidity for spreading and binding the pigments of an earthly texture. But the greatest quantities of it are consumed by brewers, wine-coopers, &c. for FINING their liquors.

A size may be made of isinglass, by boiling half an ounce of the beaten isinglass in a pint and a half of water, till the whole be dissolved, and then straining the hot fluid through a linen rag. This size may be reduced by taking half the above quantity, and adding to it an equal measure of hot water.

A very valuable GLUE is to be made of this drug.

It is valuable, in that it will keep also, and is a very proper form to keep isinglass in, for readiness for the wine-cooper's use; besides this it serves also very elegantly for the taking off the impressions of medals, coins, &c. See Medal.

Ichthyocolla *piscis*, in *Ichthyology*, the name of a large fish, of the STURGEON kind; from which, as also from the *huso Germanorum*, the drug called isinglass or *ichthyocolla* is made. It is a fish of very great size, and is cartilaginous, having no bones nor scales; its head is large and thick, and its mouth stands very forward; the upper jaw has four fleshy apophyses hanging from it; its eyes are small; its flesh is very well tasted, but glutinous; it is of a yellowish colour, and its tail is large and forked. See Beluga-*fluvi*.

ICHTHYOLOGISTS, authors who have written concerning fishes. The authors who have left us treatises on this subject are very numerous; and are ranged by Artedi into their several proper classes, with great care and candor.

The systematical *ichthyologists* are Aristotle, Pliny, Isidore, Albertus Magnus, Gaza, the interpreter of Aristotle, Marschall, Wootton, Bellonius, Rondeletius, Salvian, Gesner, Aldrovand, Johnston, Charlton, Willughby, Ray, Artedi, and Linnæus.

The *ichthyologists* who have written of the fishes only of some particular places, are these. Ovid, of the fishes of the Euxine; Oppian, of those of the Adriatic; Ausonius, of those of the Moselle; Mangelt, of those of the Podamic lake; Paulus Jovius, of those of the Tyrrhene sea; Bened. Jovius, of those of the lake Larius; Petrus Gillius, of those of the Massilian sea; Figulus, of those of the Moselle: Salvian, of those of the Tyrrhene sea; Schwenkfeldt, of those of Silesia; Schonefeldt, of those of Humburgh; Margrave, of the Brasilian fishes; Ruysel, of those of Amboyna; and Francis Valentine, of those of the same place. Of these authors, Ovid, Ausonius, Oppian, and Bened. Jovius, wrote in verse, the rest in prose.

The *ichthyologists*, who have copied all they have written from the works of other writers, and therefore fall deserve the name, are the following. Pliny, Ælian, Athenæus, Isidore, the author of the Libri De Natura Rerum, Albertus Magnus, Joannes Cuba, Marschall, Gesner in great part, Aldrovand in great part, Johnston, Charlton, and perhaps some others.

In regard to method, some have written of fishes without any method at all; some have treated of them in the alphabetical order of their names, and some have followed a method more or less perfect throughout their works.

Those *ichthyologists* who have attended to no method at all, are Ovid, Ælian, Athæneus, Ausonius, Hildegarde, De Pinguia, Paulus and Bened. Jovius, Figulus, Salvian in his History of the Roman Fishes, and Ruysch.

Those who have written alphabetically, are Cuba, Marschall, Salvian in his Tabula Piscatoria, Gesner, Schonefeldt, Johnston.

Among the authors who have used some sort of method, those come first who have treated of fishes according to the places where they are usually caught. Of these are Oppian, Rondeletius, Aldrovand, Johnston, and Charlton.

Those who have treated of fishes according to the general division of them into cetaceous, *spinosi*, and cartilaginous, are Aristotle, who was author of the method, Wootton, Willughby, Ray; the last two authors have added to this the numbering the rays of the fins on the back, which is one step toward the Artedian method.

The principal and best authors in this study, and who have reformed and amended it, are Aristotle, Bellonius, Rondeletius, Salvian, Gesner, Willughby, and Ray. To these are to be added such as have described quite new or particular fishes, who have merited greatly of the world by the new lights they have thrown in upon this part of natural history. These are Paulus Jovius, Petrus Gillius, Schonefeldt, Sibbald, Marsigli, Hebenstreit, and our countryman Mark Catesby: all the rest, except Pliny, Athenæus, Aldrovand, and Johnston, are of no use or value. Willughby is allowed by Artedi to be by far the best author on the subject; but the world will now give that character to Artedi himself. Artedi, De Script. Ichthyol.

ICHTHYOLOGY, of ἰχθὺς, *fish*, and λόγος, *discourse* or *art*, the science which treats of fish. The proper objects of this study are aquatic animals, which have fins, and have no feet. The business of *ichthyology* is, first, to distinguish all the parts of fish by their several proper names; then to adapt to each fish its proper generical and specific names; and finally to commemorate some of its peculiar qualities. See Fish, and Generical *Name*.

ICHTHYOMANTIA, ἰχθυομαντεία, in *Antiquity*, a species of divination by means of the entrails of fishes.

ICHTHYOPHAGI, ἰχθυοφάγοι, compounded of ἰχθὺς, *fish*, and φάγω, *to eat*, *fish-eaters*, a name given to a people, or rather to several different people, who lived wholly on fish.

The *Ichthyophagi*, spoken of by Ptolemy, are placed by Sanson in the provinces of Nanquin and Yantong. Agatharcides calls all the inhabitants between Carmania and Gedrosia, by the name *Ichthyophagi*.

From the accounts given us of the *Ichthyophagi*, by Herodotus, Strabo, Solinus, Plutarch, &c. it appears, indeed, that they had cattle, but that they made no use of them, excepting, as they say, to feed their fish. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors, and the mortars wherein they pounded their fish, and baked it in the sun, were nothing else but their vertebræ.

CATHYPERIA, in *Natural History*, the name given by Dr. Hill to the bony palates of fishes, which are frequently found fossile at great depths in the earth, and usually immersed in the strata of stone; and in this state had been named by Mr. Lhwyd, from their resemblance in shape to the pods of lupines, and some of the other leguminous plants, *filiquosa*.

Many from this name, and this casual resemblance to the pods of plants, have been misled into the believing them fossils of vegetable origin. But they have plainly all of them been the bony coverings of different parts of the mouths of certain fish of the cartilaginous, and perhaps other kinds, whose principal food being shell-fish, their bony palates were necessary to the eating of them. Many of the *cathyperia* are found indeed plainly worn and rounded by use.

They are sometimes found in their fossile state joined to one another; but commonly in single pieces or joints, or in fragments of such. They are of the same substance with the ECHINITE, and their shape depends on the species of fish, in part of the mouth, to which they belonged. But their most usual figure is that of half the shell of the pod of a lupine. Their sizes are various, from the semis of an inch to two inches in length, and an inch in breadth. Their surface is sometimes smooth and polished; sometimes finely striated or fluted, and sometimes wholly covered with tubercles. They are also found of very different colours; but most frequently either black, or of a dark chestnut colour.

They are found lodged and bedded in the strata of stone, in Germany, Italy, and France, and in the islands of the Archipelago, and in Syria among the spines of the echinis; but they are no where so frequent as in England, there being with us very few quarries of stone which do not afford more or less of them. See *Nat. of Fossils, Chap.* II. Hill's Hist. of Fossils, p. 635.

ICHTHYS, ιχθυς, in *Antiquity*, a famous acrostic of the Erythræan sibyl, mentioned by Eusebius and St. Austin; the first words of every verse of which make up these Χριστὸς Θεοῦ Υἱὸς σωτὴρ, Ἰησοῦς Χριστὸς Θεοῦ Υἱὸς, σταυρὸς. The initial letters of which compose the word *ichthys*, ιχθυς.

ICICA, in the *Materia Medica*, a name given by some to the GUM *elemi*.

ICICARIBA, in *History*, a name used by some authors for the tree which affords us the GUM *elemi*, used in medicine.

ICOCA, in *Botany*, the name of a genus of plants, described by Plumier; since called by Linnæus *chrysobalanus*. See *Cocoa* PLUM.

ICON, εικων, in *Rhetoric*, the same with IMAGE.

CONOCLASTS, or ICONOCLASTÆ, formed from εικων, *image*, and κλαω, *to break*, in *Ecclesiastical History*, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.

In this sense, not only the reformed, but some of the eastern churches, are called *iconoclasts*, and are all efteemed by them heretics, as oppoſing the worſhip of the images of God, and the ſaints, and breaking their figures and repreſentations in churches.

The oppoſition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century, which the worſhip of them became common. See IMAGE. But the tumults occaſioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The diſpute, however, broke out with redoubled fury under Leo the Iſaurian, who iſſued out an edict in the year 726, abrogating, as ſome ſay, the worſhip of images, and ordering all the images, except that of Chriſt's crucifixion, to be removed out of the churches; but, according to others, this edict only prohibited the paying to them any kind of adoration or worſhip. This edict occaſioned a civil war, which broke out in the iſlands of the Archipelago, and by the ſuggeſtions of the prieſts and monks, ravaged a part of Aſia, and afterwards reached Italy. The civil commotions and inſurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his ſubjects, in the Italian provinces, violated their allegiance, and riſing in arms either maſſacred or baniſhed all the emperor's deputies and officers. In conſequence of theſe proceedings, Leo aſſembled a council at Conſtantinople in 730, which degraded Germanus, the biſhop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of ſevere puniſhments upon ſuch as were attached to that idolatrous worſhip. Hence aroſe two factions; one of which adopted the adoration and worſhip of images, and on that account called *iconoduli* or ICONOLATRÆ; and the other maintained that ſuch worſhip was unlawful, and that nothing was more worthy the zeal of Chriſtians than to demoliſh and deſtroy thoſe ſtatues and pictures, which were the occaſions of this groſs idolatry; and hence they were diſtinguiſhed by the titles of *iconomachi*, from εικων, *image*, and μαχομαι, *I contend*, and *iconoclaſtæ*. The zeal of Gregory II. in favour of image-worſhip, was not only imitated, but even ſurpaſſed by his ſucceſſor Gregory III. in conſequence of which the Italian provinces were torn from the Greek empire.

Conſtantine, called Copronymus, from κοπρος, *ſtercus*, and ονομα, *nomen*, becauſe he was ſaid to have defiled the ſacred font at his baptiſm, ſucceeded his father Leo in 741, and in 754 convened a council at Conſtantinople, regarded by the Greeks as the ſeventh œcumenical council, which ſolemnly condemned the worſhip and uſe of images. Theſe who, notwithſtanding this decree of the council, raiſed commotions in the ſtate, were ſeverely puniſhed, and new laws were enacted, to ſet bounds to the violence of monaſtic rage. Leo IV. who was declared emperor in 775, purſued the ſame meaſures, and had recourſe to the coercive influence of penal laws, in order to extirpate idolatry out of the Chriſtian church. Irene, the wife of Leo, poiſoned her huſband in 780; aſſumed the reins of empire during the minority of her ſon Conſtantine, and in 786 ſummoned a council at Nice in Bithynia, known by the name of the ſecond Nicene council, which annulled the laws and decrees againſt the new idolatry, reſtored the worſhip of images and of the croſs, and denounced ſevere puniſhments againſt thoſe who maintained that God was the only object of religious adoration. In this council, the biſhops, Germans, and Gauls, were of opinion, that images might be lawfully continued in churches; but they conſidered the worſhip of them as highly injurious and offenſive to the Supreme Being. Charlemagne diſtinguiſhed himſelf as a mediator in this controverſy; he ordered four books concerning images to be compoſed, refuting the reaſons urged by the Nicene biſhops to juſtify the worſhip of images, which he ſent to Adrian, the Roman pontiff, in 790, in order to engage him to withdraw his approbation of the decrees of the laſt council of Nice. Adrian wrote an anſwer; and in 794, a council of three hundred biſhops, aſſembled by Charlemagne at Frankfort on the Maine, confirmed the opinion contained in the four books, and ſolemnly condemned the worſhip of images. In the Greek church, after the baniſhment of Irene, the controverſy concerning images broke out anew, and was carried on by the contending parties, during the half of the ninth century, with various and uncertain ſucceſs. The emperor Nicephorus appears, upon the whole, to have been an enemy to this idolatrous worſhip. His ſucceſſor, Michael Curopalates, ſurnamed Rhangabe, patroniſed and encouraged it. But the ſcene changed on the acceſſion of Leo the Armenian to the empire; who aſſembled a council at Conſtantinople in 814, that aboliſhed the decrees of the Nicene councils. His ſucceſſor Michael, ſurnamed Balbus, diſapproved the worſhip of images, and his ſon Theophilus treated them with great ſeverity. However, the empreſs Theodora, after his death, and during the minority of her ſon, aſſembled a council at Conſtantinople in 842, which reinſtated the decrees of the ſecond Nicene council, and encouraged image worſhip by a law. The council held at the ſame place under Photius, in 879, and reckoned by the Greeks the eighth general council, confirmed and renewed the Nicene decrees. In commemoration of this council, a feſtival was inſtituted by the ſuperſtitious Greeks, called the Feaſt of Orthodoxy. The Latins were generally of opinion, that images might be ſuffered as the means of aiding the memory of the faithful, and of calling to their remembrance the pious exploits and virtuous actions of the perſons whom they repreſented; but they deteſted all thoughts of paying them the leaſt marks of religious homage or adoration. The council of Paris, aſſembled in 824, by Lewis the Meek, reſolved to allow the uſe of images in the churches, but ſeverely prohibited rendering them religious worſhip. Nevertheleſs, towards the concluſion of this century, the Gallican clergy began to pay a kind of religious homage to the images of ſaints, and their example was followed by the Germans, and other nations. However, the *iconoclaſts* ſtill had their adherents among the Latins; the moſt eminent of whom was Claudius, biſhop of Turin, who, in 823, ordered all images, and even the croſs, to be caſt out of the churches, and committed to the flames; and he wrote a treatiſe, in which he declared both againſt the uſe and worſhip of them. He condemned relics, pilgrimages to the Holy Land, and all voyages to the tombs of ſaints; and to his writings and labours it was owing, that the city of Turin, and the adjacent country, was, for a long time after his death, much leſs infected with ſuperſtition than the

the other parts of Europe. The controverſy concerning the ſanctity of images was again revived by Leo, biſhop of Chalcedon, in the eleventh century, on occaſion of the emperor Alexius's converting the figures of ſilver, that adorned the portals of the churches, into money, in order to ſupply the exigencies of the ſtate. The biſhop obſtinately maintained, that he had been guilty of ſacrilege; and publiſhed a treatiſe, in which he affirmed, that in theſe images there reſided an inherent ſanctity, and that the adoration of Chriſtians ought not to be confined to the perſons repreſented by theſe images, but extended to the images themſelves. The emperor aſſembled a council at Conſtantinople, which determined, that the images of Chriſt and of the ſaints were to be honoured only with a relative worſhip; and that invocation and worſhip were to be addreſſed to the ſaints only as the ſervants of Chriſt, and on account of their relation to him, as their maſter. Leo, diſſatisfied even with theſe abſurd and ſuperſtitious deciſions, was ſent into baniſhment. In the weſtern church, the worſhip of images was diſapproved and oppoſed by ſeveral conſiderable parties, as the Petrobruſſians, Albigenſes, Waldenſes, &c. till at length this idolatrous practice was entirely aboliſhed in many parts of the Chriſtian world by the Reformation. Moſheim's Eccl. Hiſt. vol. ii. p. 91. 148, &c. 238, &c. See IMAGE.

ICONOGRAPHIA, Εικονογραφια, derived from εικων, *image* and γραφω, *I deſcribe*, the deſcription of images, or ancient ſtatues of marble and copper; alſo of buſts and ſemi-buſts, penates, paintings in freſco, moſaic works, and ancient pieces of miniature.

ICONOLATRÆ, or ICONOLATERS, from εικων, and λατρευω, *I worſhip*, or ICONODULI, from εικων and δουλος, *I ſerve*, thoſe who worſhip images; a name which the *iconoclaſtes* give to thoſe of the Romiſh communion, on account of their adoring images, and of rendering to them the worſhip only due to God. See ICONOCLASTS and IMAGE.

ICONOLOGIA, formed from εικων, and λεγω, *I ſpeak*, the interpretation of ancient images, monuments, and emblems.

ICONOMACHI. See ICONOCLASTS.

ICOSAHEDRON, in *Geometry*, a regular body, or ſolid, terminated by twenty equilateral and equal angles.

The *icoſahedron* may be conſidered as conſiſting of twenty triangular pyramids, whoſe vertices meet in the centre of a ſphere, imagined to circumſcribe it; and therefore they all have their heights and baſes equal; wherefore the ſolidity of one of thoſe pyramids, multiplied by 20, the number of baſes, gives the ſolid content of the *icoſahedron*.

ICOSANDRIA, in *Botany*, the twelfth claſs of plants with hermaphrodite flowers, and a large number of ſtamina or male parts in each, comprehending five orders.

The word is derived from the Greek εικοσι, *twenty*, and ανηρ, male. See *Tab.* I. *of Botany, Claſs* 12. and *Tab.* IV. *Claſs* 12.

It ſhould therefore ſtrictly ſignify a flower with twenty ſtamina, but it is only underſtood in an indefinite ſenſe, and made to expreſs ſuch plants as have any larger number, commonly twenty, often more, and thoſe growing to the inner ſide of the cup of the flower, not to the receptacle of the future ſeeds. See FRUCTIFICATION.

ICTERIC, derived from the Greek ικτερος, which ſignifies the ſame; and ſome derive it farther from ικτις, a kind of weaſel with yellow eyes, a term in *Phyſic*, applied to ſuch perſons as have the JAUNDICE; which the Latins call *icterus*, *auriga*, or *morbus regius*.

Icteric medicines are thoſe remedies preſcribed in caſes of the jaundice.

ICTERIC *decoction*. See MADDER.

ICTERUS *lapis*, in *Natural Hiſtory*, a name given by the ancients to a ſtone, famous for the cure of the jaundice. Pliny deſcribes four ſpecies of this ſtone. But theſe deſcriptions are ſo ſhort, that we cannot determine from them which of the ſtones of thoſe known at preſent, were intended.

ICTIAR, in the *Eaſtern Military Orders*, an officer who has gone through all the degrees or poſts in his reſpective body; and has a right to be a member of the divan

ICTIS, in *Zoology*, a name originally Greek, by which ſome authors call the FERRET.

IDÆA *radix*, in *Botany*, a name uſed by Columna and ſome other authors for the large narrow-leaved kind of ruſcus, or butcher's broom; called by others *boſſinga*.

IDEA, ἰδεα, the IMAGE or reſemblance of a thing, which, though not ſeen, is conceived by the mind.

The word is Greek; Cicero renders it into Latin by *exemplar*, and *exemplum*; and Plato himſelf, in ſome places, by παραδειγμα. Cicero, in his Topics, alſo expreſſes it by *forma* and *ſpecies*.

IDEA, in *Phyſiology*, denotes the immediate object of the mind about which we are employed, when we perceive or think of any thing; and this definition of Mr. Locke's is much leſs exceptionable than that of ſome other logicians, who define an *idea* to be a pattern or copy of a thing in the mind.

Thus, when we look at the ſun, we do not ſee that luminary itſelf, but its image, or appearance, conveyed to the ſoul by the organ of ſight; and this image we call *idea*.

The origin of *ideas* has been a long time diſputed among philoſophers. The Peripatetics maintain, that external objects emit ſpecies which reſemble them all around; and that theſe ſpecies, ſtriking on our ſenſes, are by them tranſmitted to the underſtanding; and that, being material and ſenſible, they are rendered intelligible by the active intellect; and are at length received by the paſſive. Others are of opinion, that our ſouls have of themſelves the power of producing *ideas* of things we would think upon; and that they are excited to produce them by the impreſſions which objects make on the body, though theſe impreſſions are not images in any reſpect like the objects that occaſioned them. And in this, ſay they, it is, that man is made after the image of God, and that he partakes of his power; for as God made all things out of nothing, and can reduce them to nothing when he pleaſes, ſo man can create as many *ideas* as he pleaſes, and annihilate them when he has done.

Others maintain, that the mind has no occaſion for any thing beſide itſelf to perceive objects; and that, by conſidering itſelf, and its own perfections, it is able to diſcover all things that are without. Others, with Deſcartes, hold, that our *ideas* were created and born along with us.

Malebranche, and his followers, aſſert, that God has in himſelf the *ideas* of all the beings he has created; that thus he ſees all things, in conſidering his own perfections, to which they correſpond; and that, as he is intimately united to our ſouls, by his preſence, our mind ſees and perceives things in him which repreſent created beings; and that it is thus we come by all our *ideas*. He adds, that, though we ſee all ſenſible and material things in God, yet that we have not our ſenſations in him. When we perceive any ſenſible object, in our perception is included both a ſenſation, and a pure *idea*. The ſenſation is a modification of the ſoul, and it is God who cauſes it in us; but for the *idea* joined with the ſenſation, it is in God; and it is in him that we ſee it.

The Carteſians diſtinguiſh three kinds of *ideas*. The firſt, *innate*; ſuch, as they ſay, is that we have of God, as of a being infinitely perfect. The ſecond, *adventitious*, which the mind receives in proportion as bodily objects preſent themſelves to our ſenſes: ſuch is the *idea* of body, ſound, figure, light, &c. The third, according to theſe philoſophers, are *factitious*, which are thoſe which the mind forms, by uniting and aſſembling the *ideas* which it already had; and theſe are called *complex*. But Mr Locke ſeems to have put this matter out of diſpute; having made it appear, that all our *ideas* are owing to our ſenſes; and that all innate, created, and factitious *ideas*, are mere chimeras.

Our mind, he ſhews, has not abſolutely any *ideas* beſides thoſe preſented to it by the ſenſes, and thoſe which it forms by its own operations on thoſe others which the ſenſes furniſh; ſo that a man, deſtitute of one of his ſenſes, would never have any *idea* belonging to that ſenſe; and, ſuppoſing him deſtitute of all the ſenſes, he would never have any *idea* at all; external objects having no other way of producing *ideas* in him, but by means of ſenſation, he would have no *idea*, not even of reflection; becauſe in wanting all ſenſation, he wants that which would excite in him the operations of his mind, which are the objects of his reflection.

It is plain, therefore, there is no innate *idea*; no general truth, or firſt principle, inherent in the ſoul, and created with it; no immediate object of the mind, before it had perceived external objects by means of the ſenſes, and reflected on that perception. Thoſe *ideas* only ſeem to be innate, becauſe we find we have them as ſoon as we come to the uſe of reaſon; but they are, in effect, what we formed from the *ideas* where with the mind was inſenſibly filled by the ſenſes. Thus, when the mind is employed about ſenſible objects, it comes by the *ideas* of bitter, ſweet, yellow, hard, &c. which we call *ſenſation*; and, when employed about its own operations, perceiving and reflecting on them, as employed about the *ideas* before got by ſenſation, we get the *ideas* of perception, thinking, doubting, willing, &c. which we call *inward ſenſation*, or *reflection*: and theſe two, viz. external material things, as the objects of ſenſation, and the operations of our own minds, as the objects of reflection, are the only originals whence all our *ideas* have their riſe. When we have conſidered theſe, and their ſeveral modes

and

and combinations, we shall find, that they contain our whole stock of *ideas*, insomuch that the understanding does not seem to have the least glimmering of any *idea*, that it did not receive from one of those sources.

And thus far the mind appears merely passive, as not having it in its power to choose whether it will have these first beginnings, or materials of knowlege, or not. For the objects of sense will obtrude their *ideas* upon the mind; and the operations of the mind will not let us be without some (however obscure) notions of them.

The origin of our *ideas* and notions is a perplexed question, and not at all cleared up by the labours of metaphysicians. As to *ideas* of sense, some philosophers have pretended, that bodies acting or pressing upon our nerves, or putting the animal spirits in motion, produce sensation; but as the motion communicated to the nerves or spirits has nothing in common either with the thing or body moving, or with the *idea* excited in the mind, and that we do not conceive the least relation between the motion of the nerves or spirits, and the production of an *idea*, to say that the motion of, or impression upon the nerves or animal spirits is the cause of *idea*, is explaining nothing at all.

The species emitted by objects, and the formation of *ideas* by the soul itself, are not more clear. As to innate *ideas*, it is true indeed, that the arguments of those who maintain them, have been refuted by Mr. Locke; but when he goes further, and denies innate *ideas*, his arguments have been thought by some not to be conclusive.

The opinion of Leibnitz concerning the origin of *ideas*, seems to have some affinity with innate *ideas*. He asserts the soul to be simple, and without parts or composition; hence he concludes, that no created thing can act internally upon it, but that all the changes it undergoes depends upon some internal principle.

God has formed every soul, so as to have different perceptions; some distinct, many confused; and a great number so obscure, as hardly to be perceived. All these *ideas* together represent the universe; understanding by this term every thing that has been, *is*, or shall be. According to the different relations that each particular soul has with the universe, some of its *ideas* are distinct, and distinctly represent a certain part of the universe. The foundation of this opinion is, that as each part of the universe distinctly represented, has a necessary relation with every thing that exists, with every thing that has been, or shall be, all things being connected, so that the one is the consequence of another; in like manner, the representation of a certain part of the universe has a necessary and inseparable relation to the representation of the whole.

From whence it follows, that all distinct perceptions of the soul being connected with the *ideas* of all other things, these must likewise be in the soul, though obscurely. In this sense Mr. Leibnitz asserted, that the soul is the mirror of the universe. Now all things that happen in the universe, succeed each other according to certain laws. In like manner in the soul, *ideas* become successively distinct according to other laws; which, though they have a relation to the former, are yet consistent with the nature of intelligence.

All human souls have the same *ideas*, taking the *ideas* of each individual collectively. But distinct *ideas* are not the same in each; these depending upon the relation which each soul has to the universe; and this relation is different, according to the station which God has pleased to allign to each. This seems a fair representation of Mr. Leibnitz's system, relating to the origin of *ideas*; upon which we may remark, that the foundation of this system, is, that all the parts of the universe have a necessary connection: but to make just conclusions from this proposition, the connection must be such, that things being considered in themselves, no one thing can be supposed, without all others being so necessary a consequence thereof, that the *idea* of another universe in which there should be any thing belonging to our actual universe, must be contradictory.

If such a connection took place, what is supposed concerning obscure *ideas*, would be true in a certain sense; to wit, that it might be said, that a man who has a distinct *idea* of a triangle, has thereby obscure *ideas* of all the properties of this figure, because of the necessary connection between these last *ideas* and the former.

But no such connection between *ideas* succeeding each other in the soul is perceiveable. For if passing from a dark place to one that is enlightened, I thereby suddenly acquire the *ideas* of several objects, never before seen, it does not appear that the previous perception of darkness must necessarily lead me to these new *ideas*.

These and other difficulties may be urged against Mr. Leibnitz's system; nor is Malebranche's more fortunate. This philosopher supposes there can be no cause of an *idea*, but this *idea* itself in another intelligent being; and from hence he concludes, that we acquire our *ideas* while our soul perceives them in God.

To prove his opinion, he enumerates all the ways in which the origin of *ideas* is explicable; and concludes, after having reduced all others, that his own is the only true one. But his reasoning labours under two defects. First, who can pretend, in a subject so obscure, to enumerate all the possible ways of the soul's acquiring its *ideas*? He did not know Leibnitz's opinion, very different from that of the Cartesians; and other solutions might perhaps be found out. Secondly, the falsity of other opinions is not sufficiently demonstrated; so that, upon the whole, nothing is yet clear about the origin of *ideas*.

The consideration of the memory does not a little increase the difficulties concerning our *ideas*. Many *ideas* not present may be recalled to mind. Those *ideas* are certainly somehow differently related to the soul than those it never did perceive, or those which it cannot recollect. But what is an *idea* in the soul, which the soul does not yet perceive? Yet such there are. If to explain this we recur to the constitution of the brain, new discoveries arise. What memory can spirits separated from bodies have? If no memory, what intelligence? See s'Gravesande's Introduct. à la Philosophie, p. 134.

As to Malebranche's notion, see also Locke's Posthumous Works, where this opinion is particularly examined; and Berkeley's Dialogues, 2d edit. p. 257, 258, &c.

The ingenious Mr. Harris seems to consider all our *ideas* as innate; originally impressed on our minds by the Deity, and only awakened or called forth by the presence of external objects. *Ideas*, he says, are of the essence of mind, and, therefore, having no relation to corporeal things, cannot be produced by them. But this takes for granted a principle which is contrary to all appearance; viz. that the mind is of such a nature as that it can have no possible connection with matter, or be properly affected by it. Whatever be the nature of the thinking principle, it seems agreeable to fact and universal experience to conclude, that it is capable of being affected, either by natural operation, or, in consequence of an established law, by external objects; and that its perceptions correspond to the state of the corporeal system. Besides, Mr. Harris allows that sensible objects have a natural power of awakening *ideas*; and why may they not have a natural power of originally exciting them in the same mind? Mr. Harris further argues, that his hypothesis is necessary to account for the identity of the *ideas* of different minds, which could not be explained, if they were only generated from sensible objects, which are fluctuating and variable. But it may be replied, that there is an equal identity or diversity in external objects, as there is in our *ideas* of them; and the correspondence between both is so strict, as to afford a sufficient proof, that our *ideas* have this origin, and no other. This ingenious writer supposes also, that the mental origin of our *ideas* is necessary to account for the correspondence subsisting between the *ideas* of the divine mind, and those of our's, and consequently to the communication between him and us. If sensation were the only source of our *ideas*, this argument would have considerable force; but the contrary appears to be the fact, even upon the system of Mr. Locke, and will be more particularly illustrated in the sequel of this article. See Hermes, p. 380 394, &c. 399, &c. and Priestley's Examination of Dr. Reid's Inquiry, &c. p. 334, &c.

Dr. Price, in his Inquiry into the Original of our *Ideas*, has taken occasion to remark, that the system of Mr. Locke, which ascribes all our *ideas* to sensation and reflection, is materially defective; for, if by sensation we understand the effects arising from the impressions made on our minds by external objects, and by reflection the notice which the mind takes of its own operations, it will be impossible to derive some of the most important of our *ideas* from them. This excellent reasoner observes, that the power within us that understands, the INTUITION of the mind, or the faculty in it that discerns truth, that views, compares, and judges of all *ideas* and things, is a spring of new simple *ideas*, or original, primary, and uncompounded perceptions of the mind. To this source he refers our *ideas* of the impenetrability and *vis inertiæ* of matter, substance, duration, space, infinity, necessity, contingency, possibility, impossibility, power, causation, &c. all our abstract *ideas*, (see ABSTRACTION) and also our *ideas* of moral right and wrong, and of moral obligation. It is, he says, of the essence of these *ideas* to imply something true or false of an object; and that they by no means denote the manner in which we are affected by it; so that they cannot with any propriety be referred to that part of our constitution, which has been distin-

distinguished by the appellation of sense. Accordingly, our *ideas* may be divided, first, into those implying nothing real without the mind, or nothing real and true, besides its own affections and passions; to which class we may refer the immediate effects of impressions on the bodily senses, without supposing any previous *ideas*, as all tastes, smells, colours, &c. and those that arise upon occasion only of other *ideas*; as the effects us us of connecting order, happiness, the beauties of poetry, painting, &c. Secondly, into those which are images of something distinct from sensation, or which imply real, independent existence and truth; which may be subdivided into such as denote the real properties of external objects, and the actions and passions of the mind; and those which are derived immediately from intelligence. By the notices conveyed to the mind through the organs of the body, or its observation of the necessary attendants and concomitants of certain sensations and impressions, it perceives the figure, extension, motion, and other primary qualities of material substances; by contemplating itself, it perceives the properties of spiritual substances, volition, consciousness, memory, &c. To all these *ideas* it is allowed that they have real, certain, invariable archetypes, actually existing, to which they are referred, and to which they are conformable. These *ideas* again become objects or archetypes to the intellective faculty; from whence arise a new set of *ideas*, which are the perceptions of this faculty, and represent not the mind's own affections, but intellect truth. Antecedently to these, whatever other *ideas* we may be furnished with, nothing is understood, whatever feats or subjects of knowledge may be in the mind, nothing is known. Price's Review, &c. of Morals, Sect. 3, and 5.

The system of Mr. Locke, with regard to the origin of our *ideas*, has been lately attacked with considerable confidence by Dr. Reid and others; and it has been charged as the foundation of universal scepticism. Dr. Reid objects to every system which supposes that the mind receives images of things from without by means of the senses, because sensations bear no resemblance to bodies, or any of their qualities. With regard to extension, figure, motion, &c. he says, if they are not *ideas* of sensation, nor like to any sensation, then the ideal system is a rope of sand, and all the laboured arguments of the sceptical philosophy against a material world, and against the existence of every thing but impressions and *ideas*, proceed upon a false hypothesis. To this objection it has been replied, that *ideas* are only, in a figurative sense, the images of external things; that certain impressions are conveyed to the mind by means of the organs of sense, and their corresponding nerves, between which, and the sensations existing in the mind, there is a real and necessary, though at present an unknown connection; and that the same reasoning would lead him to deny that sounds are produced by bodies striking against one another, because he can perceive no proper resemblance between the cause and the effect.

Dr. Reid further objects to the notion generally received among philosophers, that the images of external objects are conveyed by the organs of sense to the brain, and there perceived by the mind. But from this objection it might be inferred, that the whole system of our senses, nerves, and brain, is of no real use whatever; because it is impossible to say how they act upon the mind, or the mind upon them.

It is also objected, that Mr. Locke's division of *ideas* into those of sensation, and those of reflection, is contrary to all the rules of logic; because the second member of the division includes the first. For can we, says he, form clear and just notions of our sensations any other way than by reflection? Sensation is an operation of the mind, of which we get the notion, or we get the notion of it by reflecting upon that which we are conscious of. In like manner, doubting and believing are operations of the mind, whereof we are conscious, and we get the notion of them by reflecting upon what we are conscious of. The *ideas* of sensation, therefore, are *ideas* of reflection, as much as the *ideas* of doubting or believing, or any other *idea* whatsoever. But it has been alledged, that the author confounds the *idea* of *sensation* with the *idea* of *sensation itself*, which is without doubt, of the same class with the *ideas* of doubting, &c. as Mr. Locke would have allowed. But the *ideas* belonging to the class of sensation do not require any scientifical knowledge of that power, or any reflection upon it. If this were the case, brute animals, having no proper *ideas* of reflection, could have no *ideas* of sensation; and the case would be the same with the bulk of mankind. In another place, Dr. Reid acknowledges, that human beings may have *ideas* of mere sensation some time before they discover any power of reflection, and that this power may discover itself, and come into exercise afterwards.

Dr. Beattie, Dr. Oswald, and others, have pursued and extended the same kind of reasoning against the principles of Mr. Locke; and alledged, that Berkeley's reasoning against the existence of a material world, and Hume's reasoning against the existence both of soul and body, are deduced from Locke's Essay, and the Principia of Des Cartes. For an account of Berkeley's system, see Abstraction, Body, and Existence.

In opposition to this system, Dr. Reid and those who have adopted his theory have recurred to certain instinctive principles; alledging, that our perceptions necessarily imply the belief of the present existence of external objects; and that the real, separate, and independent existence of matter is believed, not because it can be proved by argument, but because the constitution of our nature is such, that we must believe it; and that we cannot, in our own minds, separate the belief of external objects from our sensations. However, it has been urged by an ingenious writer, that Mr. Locke's doctrine is not so favourable to Mr. Berkeley's theory as Dr. Reid's; and that a system which ascribes our primary mental operations to mere constitution and feeling, is more favourable to scepticism than that in the room of which it is substituted. According to Mr. Hume's system, all perceptions are either impressions or *ideas*, and it is not possible for us so much as to conceive any thing specifically different from *ideas* and impressions; and since all *ideas* are copied from impressions, we can, therefore, have no *idea* or conception of any thing of which we have not received an impression. No man can have any *idea* of power or energy, because he has never received any impression of it; and for the same reason no man can have any *idea* of self. What we call a mind is nothing but a bundle or collection of different perceptions, which succeed each other with inconceivable rapidity, and are in a perpetual flux and movement. There is properly, says Mr. Hume, no simplicity in the mind at one time, nor identity at different times, whatever natural propension we may have to imagine that simplicity and identity. They are the successive perceptions only that constitute the mind: so that there is nothing in the universe but impressions and ideas; all possible perceptions being comprehended in those two classes. Consequently, this philosophy, excluding body and mind, admits of no existence whatsoever, not even of a percipient being to be the subject of these perceptions. To the same purpose Dr. Reid observes, that, according to Mr. Locke's system, *ideas* being the only objects of thought, and having no existence but when we are conscious of them, it necessarily follows, that there is no object of our thought which can have a continued and permanent existence. Body and spirit, cause and effect, time and space, to which we were wont to ascribe an existence independent of our thought, are all turned out of existence by this short dilemma. Either these things are *ideas* of sensation or reflection, or they are not: if they are *ideas* of sensation or reflection, they can have no existence but when we are conscious of them: if they are not *ideas* of sensation or reflection, they are words without any meaning. To which we shall only reply, that we have the same reason to believe, that mind exists as that body exists; since it is only by that name that we distinguish the subject of certain powers or properties, of which we are conscious, as perception, memory, will, &c. and we have just the same reason to believe the identity of an *idea* as that of any external body, or that of our own minds.

Those who wish to be farther acquainted with the controversy relating to the nature and origin of our *ideas*, must be referred to Hume's Treatise of Human Nature, vol. i. p. 123, &c. 282, &c. 434, &c. Reid's Inquiry into the Human Mind, passim, Beattie's Essay on Truth, part ii. chap. 2. Priestley's Examination of Reid, Beattie, &c. passim. See *Common* Sense.

For an account of Dr. Hartley's system of the generation of our *ideas*, see Association, Vibration, and Vibratuncle.

The term *idea* has, by Mr. Locke, been extended to every thing we know or have any notion of, any thing about which the mind is employed in thinking. But this extensive use of the term *idea* is thought improper by a very ingenious and acute writer, who observes, that we may be said to have some knowledge or notion of our own minds, of spirits and active beings, whereof in a strict sense we have not *ideas*. In like manner, we know and have a notion of relations between things or *ideas*, which relations are distinct from the *ideas* or things related, inasmuch as the latter may be perceived by us, without our perceiving the former. The same author elsewhere observes, that by *mind*, *spirit*, *soul*, or *self*, he does not denote any one of his *ideas*, but a thing entirely distinct from them; wherein they exist, or which is the same

things, whereby they are perceived; for the existence of an *idea* consists in its being perceived. He also observes, the word *thing* or *being*, is the most general name of all, and comprehends under it two kinds entirely distinct and heterogeneous; having nothing common but the name, to wit, *spirits* and *ideas*. And in another part of his treatise, he expressly affirms, there can be no *idea* formed of a soul or spirit. Berkeley's Princ. of Human Knowledge, § 2. 27. 89. 142.

Another author has also blamed Mr. Locke for confounding *ideas* and notions. He observes, that by *ideas*, according to the common, and most usual signification of the word, is meant the image, picture, or representation in the mind of a sensible appearance, or of an object which hath before been perceived by sense. To which faculty apprehension therefore the *idea* necessarily refers, for whatever is in it, or upon any account can be alluded to it; and it seems, as is made use of in my hand, for the mind to contemplate or employ itself about in thinking, at such time when the object it represents is not immediately perceived, as in the act of sense. Vide p. 105 & 106, of a book, intitled, Two Dissertations concerning Sense and the Imagination, with an Essay on Consciousness. Lond. 1728. 8vo.

This author further adds, in opposition to Mr. Locke, that the perception of an *idea* is not an act of the understanding. He urges, that an *idea*, by Mr. Locke's own account of it, is an object, or something perceived, and about which the mind is employed in thinking. Wherefore if perception (suppose) which is an operation or act of the mind, should itself be considered as an *idea*, (and under this very title Mr. Locke treats of perception) then one *idea* would be the object of another *idea*, and so there would be an *idea* of an *idea*, or an object of an object; and one *idea* would perceive another *idea*, which there is no making any tolerable sense of. And indeed in explaining or declaring the operation of any faculty, to give it the same name and appellation with the object itself about which it is employed, and which there is a necessity of considering, in order to set forth the particular quality and nature of the operation, and the precise manner of its concerning and having to do with the object, seems very inconsistent with such a purpose or design.

This author has been very elaborate in proving and enforcing the distinction between notions and *ideas*. In another treatise he observes, that Mr. Locke, in his Essay on Human Understanding, takes no notice of rational notions, and thereby has not only given a partial and imperfect account of his subject, but made an unjust and unfair representation of it. Vide an Essay concerning Rational Notions, printed at London, 1733.

That some confusion may have arisen from giving the same name to those heterogeneous things, cannot be questioned. However, Mr. Locke is in this respect no more guilty than Malebranche and the Cartesians, who use the term *idea* in the same extensive sense with him, and from whose hints the former seems to have taken it. But then the Cartesians seem to have been more solicitous to distinguish between the *ideas* of the imagination, and those of the intellect, understanding or *de l'esprit pur*, as they sometimes express themselves, and have thereby guarded against the inconveniences arising from the too general signification of the term *idea*. See NOTIONS.

Ideas, according to Mr. Locke, are divided into *simple* and *complex*.

IDEAS, *simple*, include all those which come into the mind by sensation; and though the qualities of bodies that affect our senses, are in the things themselves so mixed and united, that there is no separation between them, yet the *ideas* they produce in the mind are simple and unmixed. Again, some of these *ideas* we acquire purely by means of one sense; as the *ideas* of colours, only by the eye; of sounds, by the ear; of heat, by the touch, &c. Other *ideas* we gain by several senses; as of space, extension, figure, rest, motion, &c. for these have their effects, both on the sight and the touch. Others, again, are had from reflection only; such as those of perception and willing. There are other simple *ideas*, again, formed in the mind, both by sensation and reflection, jointly; as those of pleasure, pain, power, existence, unity, succession, &c. And some of these kinds of *ideas* are all, or at least the most considerable, of those simple *ideas* which the mind hath, and out of which is made all its other knowledge.

The better to comprehend the nature of simple *ideas*, it will be convenient to distinguish between them, as they are *ideas* of perceptions in our minds, and as they are modifications of the bodies that cause such perceptions in us, that we may not think, as is usually done, that they are exactly the images and resemblances of something inherent in the object; for most of those of sensation are in the mind no more the likeness of any thing existing without us, than the names that stand for them are the likeness of the *ideas*.

But here the qualities of bodies which produce those *ideas* in our minds, are to be distinguished into *primary* and *secondary*. *Primary qualities* are such as are utterly inseparable from the body, in what state soever it be, and such as our senses constantly find in every particle of matter; which are solidity, extension, figure, mobility, and the like. *Secondary qualities* are, such as are, in reality, nothing in the objects themselves, but only powers to produce various sensations in us, by means of their primary qualities; that is, by the figure, bulk, texture, &c. of their parcels, as colours, sounds, tastes, &c.

Now the *ideas* of primary qualities are, in some sense, resemblances of them, and their patterns do really exist in the bodies themselves; but the *ideas* produced in us by those secondary qualities have no resemblance of them at all. There is nothing like our *ideas* existing in the bodies themselves, that occasion them: they are, in the bodies we denominate from them, only a power to produce those sensations in us; and what is sweet, warm, blue, &c. in the *idea*, is no more than the bulk, figure, and motion, of the particles of the bodies themselves, which we call so.

The mind has several faculties of managing those simple *ideas*, which are two of no notice; as, 1. That of discerning justly, and distinguishing rightly, between one and another; in which consists the accuracy of judgment.

2. That of comparing them one with another, in respect of extent, degrees, time, place, or any other circumstances of relation or dependence, one on another.

3. That of compounding, or putting together, the simple *ideas* received by sensation and reflection, in order to make complex ones.

4. Children, by repeated sensations, having got some *ideas* fixed in their memories, by degrees learn the use of signs; and when they can speak articulately, they make use of words, to signify their *ideas* to others.

Hence, the use of words being, to stand as outward marks of our internal *ideas*, and those *ideas* being taken from particular things, if every particular *idea* that we take in should have a particular name allowed to it, names would become endless. To prevent this inconvenience, the mind has another faculty, whereby it can make the particular *ideas* received from such objects, become general; which is done by considering them as they are in the mind, such appearances, separate from all other existences, and circumstances of existence, as time, place, and other concomitant *ideas*; and this is called ABSTRACTION, whereby *ideas*, taken from particular things, become general representatives of all of that kind, and their names, general names, applicable to whatever exists conformable to such abstract *ideas*. Thus, the same colour being observed to-day in chalk, or snow, which we observed yesterday, in paper, or milk, we consider that appearance alone makes it a representative of all of the *same* kind, and give it the name of *whiteness*; by which sound we always signify the same quality, wherever we be met with, or imagined.

From the powers of combining, comparing, and separating, or abstracting simple *ideas*, acquired by sensation and reflection, all our complex *ideas* are formed; and, as before, in the perception of *ideas*, the understanding was passive, so here it is active, exerting the power it hath in the several acts and faculties above mentioned, in order to frame compound *ideas*.

IDEAS, *complex*, though their number be infinite, and their variety endless, yet may all be reduced to these three heads; viz. *modes*, *substances*, and *relations*. *Modes* are such complex *ideas*, as, however compounded, are not supposed to exist by themselves, but are considered as dependences on, or affections of, substances: such are the *ideas* signified by the words *triangle*, *gratitude*, *murder*, &c.

These are of two kinds: 1. Such as are only variations, or different combinations, of the same simple *idea*, without the mixture of any other; as a dozen, a score &c. which may be called *simple modes*. 2. There are others, compounded of simple *ideas*, of several sorts put together, to make one complex one; as *beauty*, *theft*, &c.

Substances have their *ideas* from such combinations of simple *ideas*, as are taken to represent distinct particular things subsisting by themselves; in which the supposed or confused *idea* of substance, such as it is, is always the first and chief.

Relations are a kind of complex *ideas*, arising from the consideration or comparison of one *idea* with another. Of these, some only depend on the equality or excess of the same simple *idea* in several subjects; and these may be called *proportional relations*, such as *equal*, *more*, *bigger*, *smaller*,

favorer. Another occasion of comparing things together is owing to the circumstances of their origin and beginning; which not being afterwards to be altered, make the relations depending thereon as lasting as the subjects to which they belong. Thus it is with natural relations, as *father*, *mother*, *uncle*, *cousin*, &c. Thus also it is with relations by institution, as *prince* and *people*, *general* and *army*, &c. As to moral relations, they are the conformity or disagreement of men's free actions to laws and rules, whether human or divine. Further, *ideas* may be divided into *clear*, or *distinct*; and *obscure*, or *confused*.

IDEAS, *simple*, are *clear*, when they continue such as the objects present them to us when our organs of sensation are in good tune and order; when our memories retain them, and can produce and present them to the mind whenever it has occasion to consider them; and when, with this, the mind sees that those simple *ideas* are severally different one from another. The contrary to which is what we call obscurity and *confusion* of *ideas*.

A *distinct idea* is that wherein the mind perceives a difference from all others; and a *confused idea* is such a one as is not sufficiently distinguishable from another, with regard to which it ought to be different.

Again, *ideas*, with respect to the objects whence they are taken, or which they are supposed to represent, come under a threefold distinction; being either *real*, or *fantastical*; *true*, or *false*; *adequate*, or *inadequate*.

By real IDEAS are meant, such as have a foundation in nature; such as have a conformity with the real being or existence of things, or with their archetypes.

IDEAS, *fantastical* or *chimerical*, are such as have no foundation in nature, nor any conformity with that being to which they are referred, or with their archetypes.

All our simple *ideas* are real; not that they are images or representations of what does exist, but as they are the certain effects of powers in things without us, ordained by our Maker to produce in us such sensations. They are real *ideas* in us, because that by them we distinguish the qualities that are really in the bodies themselves; their reality lies in the steady correspondence they have with the distinct constitutions of real being; but whether with those constitutions as causes or patterns, it matters not, so long as they are constantly produced by them.

As to complex *ideas*; in regard they are arbitrary combinations of simple *ideas* put together, and united under one general name, in forming whereof the mind uses its own liberty, some are found *real*, and some *imaginary*.

1. Mixed modes and relations, having no other reality than what they have in the minds of men, are really nothing more being required to their reality, but a possibility of exisiting conformable to them. Those *ideas*, being themselves archetypes, cannot differ from their archetypes, and so they cannot be chimerical, unless any one jumbles inconsistent *ideas* in them: indeed, those that have names affigned to them, ought to have a conformity to the ordinary fignification of thofe names, to prevent their appearing fantaftical. 2. Our complex *ideas* of fubftances being made in reference to things exifting without us, whofe reprefentations they are thought to be, are no further real than as they are combinations of fimple *ideas* really united and exiftiing in things without us. Thofe are fantaftical that are made up of feveral *ideas* that never were found united, as *centaur*, &c.

Real ideas are divided into *adequate*, and *inadequate*.

IDEAS, *adequate*, are thofe which perfectly reprefent thofe archetypes which the mind fuppofes them taken from, and which it makes them ftand for.

IDEAS, *inadequate*, are fuch as do but partially, or incompletely, reprefent thofe archetypes to which they are referred.

IDEAS, *as to true and falfe*. It may be obferved, that truth and falfhood, in propriety of fpeech, belong only to propofitions; and when *ideas* are termed *true* or *falfe*, there is fome tacit propofition, which is the foundation of that denomination. Our *ideas* being nothing elfe but appearances or perceptions in the mind, can no more be faid to be true or falfe, than fingle names of things can be faid to be fo; for truth and falfhood lying always in fome affirmation or negation, our *ideas* are not capable of them, till the mind paffes fome judgment of them. In a metaphyfical fenfe they may be faid to be true, i. e. to be really as they exift; though in things called *true*, even in that fenfe, there feems to be a fecret reference to our *ideas*, looked upon as the ftandards of that truth which amounts to mental propofition. When the mind refers its *ideas* to any thing extraneous to it, they are then capable of being true or falfe; becaufe, in fuch a reference, the mind makes a tacit fuppofition of their conformity to that thing; and as this fuppofition is true or falfe, fo the *ideas* themfelves come to be denominated. Locke's Eflay, 8vo. vol. i. paffim.

IDENTITATE *mandi*, a writ which lies for him who, upon a capias or exigent, is arrefted, and committed to prifon, for another man of the fame name.

IDENTITY, *fameneſs*; that by which a thing is itfelf, and not any thing elfe. In which fenfe, *identity* differs from *fimilitude*, as well as *diverfity*.

Our idea of *identity* we owe to that power which the mind has of comparing the very being of things; whereby, confidering any thing as exifting at any certain time and place, and comparing it with itfelf as exifting at any other time, &c. are accordingly pronounce it the fame.

When we fee any thing in any certain time and place, we are fure it is that very thing, and can be no other, how like foever it may be to fomething elfe in all other refpects; becaufe we conceive it impoffible, that two things of the fame kind fhould exift together in the fame place, we conclude, that whatever exifts any where at the fame time, excludes all of the fame kind, and is there itfelf alone. When, therefore, we demand, whether any thing be the fame or no, it refers always to fomething that exifted at fuch a time, in fuch a place; which it was certain, at that inftant, was the fame with itfelf, and no other.

We have ideas of three forts of fubftances: of God; of finite intelligences; and of bodies. God being eternal, unbreable, and every where, concerning his *identity* there can be no doubt. Finite fpirits having had their determinate place, and time of beginning to exift, the relation to that time and place will always determine to each its *identity* as long as it exifts. And the fame will hol of every particle of matter to which no addition, or from which no fubtraction, is made. Thefe three exclude not one another out of the fame place; yet each exclude thofe of the fame kind out of the fame place. The *identity* and diverfity of modes and relations is determined after the fame manner that thofe of fubftances are; only the actions of finite beings, as motion and thought, conffiting in fucceffion, cannot exift in different times and places as permanent beings: for no motion or thought, conffidered as at different times, can be the fame; each part thereof having a different beginning of exiftence. From whence it is plain, that exiftence itfelf is the *principium individuationis*, which determines a being to a particular time and place incommunicable to two beings of the fame kind.

Thus, fuppofe an atom exifting in a determined time and place, it is evident, that, conffidered in any inftant, it is the fame with itfelf, and will be fo, as long as its exiftence continues. The fame may be faid of two, or more, or any number of particles, whilft they continue together; the mafs will be the fame, however jumbled; but if one atom be taken away, it is then not the fame maſs. But in vegetables the *identity* depends not on the fame maſs, and is not applied to the fame thing; the reafon of this is, the difference between an inanimate body, and a crude maſs of matter; this latter being only the cohefion of particles any how united, the other fuch a difpofition or organization of parts, as is fit to receive and diſtribute nourifhment, fo as to continue and frame the wood, bark, leaves, &c. (of an oak, for inftance) in which conffifts the vegetable life. That, therefore, which hath fuch an organization of parts, partaking of one common life, continues to be the fame plant, though that life be communicated to new particles of matter vitally united to the living plant. The cafe is not to much different in brutes, but that any one may hence fee what makes an animal, and continues it the fame. The *identity* of the fame man likewife conffifts in a participation of the fame continued life, in fucceeding particles of matter vitally united to the fame organized body.

To underſtand *identity* aright, we muſt conſider what idea the word ſtands for; it being one thing to be the ſame ſubſtance; another, the ſame man; and a third, the ſame perſon. An animal is a living organized body; and the ſame animal in the ſame continued life communicated to different particles of matter, as they happen ſucceſſively to be united to that organized living body; and our notion of man is but of a particular ſort of animal. Perſon ſtands for an intelligent being, that reaſons and reflects, and can conſider itſelf the ſame thing in different times and places, which it doth by that conſciouſneſs that is inſeparable from thinking. By this every one is to himſelf, what he calls *ſelf*, without conſidering whether that ſelf be continued in the ſame, or in diverſe ſubſtances. In this conſiſts perſonal *identity*, or the ſameneſs of a rational being; and ſo far as this conſciouſneſs extends backward to any paſt action, or thought, ſo far reaches the *identity* of that perſon. It is the ſelf ſame now it was then; and it is by the ſame ſelf, with this preſent one, that now reflects on it, that that action was done. Self is that conſcious thinking thing, whatever ſubſtance it matters not, which is conſcious of pleaſure

and

and pain, capable of happineſs or miſery; and ſo is concerned for itſelf as far as that conſciouſneſs extends. That with which the conſciouſneſs of this preſent thinking can join itſelf, makes the *ſame* perſon, and is one ſelf with it, and to attributes to itſelf, and owns all the actions of that thing as its own, as far as that conſciouſneſs reaches.

Conſciouſneſs, ſays the excellent biſhop Butler, of what is paſt, aſcertains our perſonal *identity* to ourſelves: yet to ſay that it makes perſonal *identity*, or is neceſſary to our being the ſame perſons, is to ſay, that a perſon has not exiſted a ſingle moment, nor done one action, but what he can remember: indeed, none but what he reflects upon. And one ſhould really think it ſelf-evident, that conſciouſneſs of perſonal *identity* preſuppoſes, and therefore cannot conſtitute, perſonal *identity*; any more than knowledge, in any other caſe, can conſtitute truth, which it preſuppoſes. Though preſent conſciouſneſs of what we at preſent do and feel is neceſſary to our being the perſons we now are; yet preſent conſciouſneſs of paſt actions or feelings is not neceſſary to our being the ſame perſons who performed thoſe actions, or had thoſe feelings. The *identity* of perſon cannot ſubſiſt with diverſity of ſubſtance; perſonal *identity* is, therefore, as Mr. Locke expreſſes it, the ſameneſs of a rational being; and the queſtion, whether the ſame rational being is the ſame ſubſtance, needs no anſwer; becauſe being and ſubſtance, in this caſe, ſtand for the ſame idea. Conſequently, though the ſucceſſive conſciouſneſſes which we have of our own exiſtence are not the ſame, yet they are conſciouſneſſes of one and the ſame thing or object: of the ſame perſon, ſelf, or living agent. The perſon of whoſe exiſtence the conſciouſneſs is felt now, and was felt an hour or a year ago, is diſcerned to be, not two perſons, but one and the ſame perſon, and, therefore, it is one and the ſame. Butler's Analogy, Append. Diſſ. I.

This perſonal *identity* is the object of reward and puniſhment, being that by which every one is concerned for himſelf. If the conſciouſneſs went along with the little finger; when that was cut off, it would be the *ſame* ſelf, that was juſt before concerned for the whole body. If the ſame Socrates, waking and ſleeping, did not partake of the ſame conſciouſneſs, he would not be the ſame perſon: Socrates waking could not be, in juſtice, accountable for what Socrates ſleeping did: no more than one twin, for what his brother-twin did; becauſe their conſciouſneſs were to like, that they could not be diſtinguiſhed.

But ſuppoſe I wholly loſe the memory of ſome parts of my life, beyond a poſſibility of retrieving them, ſo that I ſhall never be conſcious of them again; am I not again the ſame perſon that did thoſe actions, though I have forgot them? I anſwer, we muſt here take notice what the word *I* is applied to, which in this caſe is the man only: and the ſame man being preſumed to be the ſame perſon, *I* is eaſily here ſuppoſed to ſtand alſo for the ſame perſon. But if it be poſſible for the ſame man to have 2 diſtinct, incommunicable conſciouſneſs at different times, it is paſt doubt the ſame man would, at different times, make different perſons; which we ſee in the caſe of mankind in the ſolemneſt declaration of their opinions; human laws not puniſhing the madman for the ſober man's actions, nor the ſober man for what the madman did; thereby making them two perſons.

Thus we ſay, in Engliſh, ſuch a one is not himſelf, or is beſide himſelf; in which phraſe it is inſinuated, that ſelf is changed, and the ſelf ſame perſon is no longer in that man. But is not a man, drunk or ſober, the ſame perſon? Why elſe is he puniſhed for the ſame fact he commits when drunk, though he be never afterwards conſcious of it? Juſt as much the ſame perſon, as a man that walks, and does other things in his ſleep, is the ſame perſon, and is anſwerable for any miſchief he ſhall do in it. Human laws puniſh with a juſtice ſuitable to their way of knowledge; becauſe in theſe caſes they cannot diſtinguiſh certainly what is real, and what is counterfeit: and ſo the ignorance in drunkenneſs, or ſleep, is not admitted as a plea. For though puniſhment be annexed to perſonality, and perſonality to conſciouſneſs, and the drunkard is not conſcious, perhaps, of what he did, yet human judicatures juſtly puniſh him, becauſe the fact is proved againſt him; but want of conſciouſneſs cannot be proved for him. But in the great day, wherein the ſecrets of all hearts ſhall be laid open, it may be reaſonable to think no one ſhall be made to anſwer for what he knows nothing of, but ſhall receive his doom; his own conſcience accuſing, or elſe excuſing him.

To conclude this article: whatever ſubſtance begins to exiſt, it muſt, during its exiſtence, be the ſame; whatever compoſition of ſubſtances begin to exiſt, during the union of thoſe ſubſtances, the concrete muſt be the ſame. Whatſoever mode begins to exiſt, during its exiſtence it is the ſame; and ſo is the compoſition be of diſtinct ſubſtances, and different modes, the ſame rule holds. Whence it appears, that the difficulty or obſcurity that has been about this matter, rather ariſes from names ill uſed, than from any obſcurity in the things themſelves. For whatever makes the ſpecific idea, to which the name is applied, if that idea be ſteadily kept to, the diſtinction of any thing into the ſame and diverſe, will eaſily be conceived. Locke's Eſſay, vol. I. chap. 27.

IDEOT. See IDIOT, and LUNATIC.

IDES, Idus, in the *Roman Calendar*, a denomination given to eight days in each month; commencing in the months of March, May, July, and October, on the fifteenth day; and in the other months on the thirteenth day; and reckoned backward, ſo as in the four months above ſpecified to terminate on the eighth day, and in the reſt on the ſixth.

The origin of the word is conteſted. Some will have it formed from *dies, ſcire*: becauſe the full moon was commonly ſeen on the day of the *ides*; others from *videndo, ſpectando*, or, on account of the image of the full moon then viſible; others from *idumon*, or *eidumon*, a name given by the Hetrurians to a victim offered on that day to Jupiter; others from the Hetrurian word *idus*, i. e. *dimidia*; becauſe the *ides* divided the moon into two nearly equal parts.

The *ides* came between the calends and the nones.

The 15th day in March, May, July, and October, and the 13th of the other months, being called the *ides* of thoſe months: *idus Martii, Maii*, &c. the fourteenth day of the ſame four months, and the 12th of the other eight, were *pridie idus*, or the eve of the *ides* of March, &c. the 13th day in the four months, and the 11th in the eight, was called the third of the *ides* of ſuch months, 3 *idus Martii*, &c. ſo the 12th day in the four, and the 10th in the eight months, were the 4th of the *ides*, 4 *idus Martii*, &c. and thus of the reſt, to the 8th and laſt days, which made the 8th of the *ides*, 8 *idus Martii*, &c.

This way of accounting is ſtill in uſe in the Roman chancery, and in the calendar of the breviary. The *ides* of May were conſecrated to Mercury; the *ides* of March were always eſteemed unhappy, after Cæſar's murder; the time after the *ides* of June was reckoned fortunate for thoſe who entered into matrimony; the *ides* of Auguſt were conſecrated to Diana, and were obſerved as a feaſt-day by the ſlaves; on the *ides* of September, auguries were taken for appointing the magiſtrates, who formerly entered into their offices on the *ides* of May, and afterwards on thoſe of March.

IDIOM, *Idioma, proprium, of ἴδιος, proper, own*, is ſometimes uſed for the peculiarities of a language; ſometimes for a dialect, or the language of ſome particular province: differing, in ſome reſpects, from the language of the nation in general, whence it is derived.

IDIOMA, *communication of*. See COMMUNICATION.

IDIOPATHY, *Idiopathia*, derived from *ἴδιος, proper, particular*, and *πάθος, paſſion, affection*, a diſeaſe, or indiſpoſition, peculiar to ſome member, or part, of the body, not cauſed by any other diſeaſe, or preceding affection; nor having any dependence on the reſt of the body.

In which ſenſe it ſtands oppoſed to *ſympathy*, which is when the indiſpoſition takes its riſe from ſome prior diſorder in ſome other part of the body.

Thus a cataract in the eye is an *idiopathy*; an epilepſy is either *idiopathic*, or *ſympathetic*; *idiopathic*, when it happens purely through ſome fault in the brain; *ſympathetic*, when it is preceded by ſome other diſorder.

IDIOSYNCRASY, from *ἴδιος, proper, own, with*, and *κρασις, mixture, temperament*, in *Phyſic*, a temperament peculiar to ſome body, in conſequence whereof, whether in ſickneſs, or in health, it has a more than ordinary averſion, or inclination, to certain things, or is more affected with them than others uſually are.

IDIOT, or IDIOT, in the *Engliſh Laws*, denotes a natural fool, or a fool from his birth.

The word is originally Greek, *ἴδιωτης*, which primarily imports a *private perſon*, or one who leads a private life, without any ſhare or concern in the government of affairs.

A perſon who has underſtanding enough to meaſure a yard of cloth, number twenty rightly, and tell the days of the week, &c. is not an *idiot* in the eye of the law. But a man who is born deaf, dumb, and blind, is conſidered by the law in the ſame ſtate as an *idiot*.

IDIOT, *idiota*, is alſo uſed, by ancient writers, for a perſon ignorant, or unlearned; anſwering to *illiteratus*, or *imperitus*. In this ſenſe, Victor tells us, in his Chronicon, that, in the conſulſhip of Meſſala, the holy Goſpels, by command of the emperor Anaſtaſius, were corrected and amended, as having been written by *idiot* evangeliſts: *Tanquam ab* idiotis *evangeliſtis compoſitæ*.

IDIOTA *inquirendo vel examinando*, a writ iſſued out to the ſheriff

sheriff of a county, where the king has notice that there is an *idiot* naturally born, so weak of understanding that he cannot govern or manage his inheritance; directing him to call before him the party suspected, and examine him, and enquire, by a jury of twelve men, whether he be an *idiot*. For the king, by his prerogative, has the government of the lands and substance of such as are naturally defective in their discretion.

This branch of the revenue hath been long considered as a hardship upon private families; but few instances occur of the oppressive exertion of it.

IDIOTISM, derived from ἴδιος, *proper, peculiar*, in *Grammar*, a phrase, or manner of speaking, peculiar to a language, and which cannot be rendered word for word into any other.

Idiotism is defined, by some authors, an inflection of some verb, or a particular construction of some phrase or particle that is anomalous, and deviates from the ordinary rule of the language of the nation, but which is in use in some particular province of it.

Several authors have written of the *idiotisms* in the Greek and Latin languages; that is, of the particular turns in those tongues which vary the most from each other, and from the more popular among the modern tongues; but the examples of these *idiotisms* being borrowed from the best authors, *idiotism*, in this sense, cannot properly be called an irregularity.

IDLENESS, in *Law*. See VAGABOND.

IDOL, from εἶδος, which signifies the same, of εἰδέω, *imago, figuro*, a statue or image of some false god, to whom divine honours are paid, altars and temples erected and sacrifices offered.

The *idol* or image, whatever materials it consisted of, was, by certain ceremonies, called consecration, converted into a god. While under the artificer's hands, it was only a mere statue.

Three things were necessary in order to change it into a god; proper ornaments, consecration, and oration. The ornaments were various, and wholly designed to blind the eyes of the ignorant and stupid multitude, who are chiefly taken with shew and pageantry. Then followed the consecration and oration, which were performed with great solemnity among the Romans.

IDOLATRY, from εἰδωλολατρεία, which signifies the same, composed of εἶδος, *image*, and λατρεύειν, *to serve*, the worship and adoration of false gods; or the giving those honours to creatures, or the works of men's hands, which are only due to God.

Several have written of the origin and causes of *idolatry*: among the rest, Vossius, Selden, Godwyn, and Tennison; but it is still a doubt who was the first author of it. It is generally allowed, however, that it had not its beginning till after the deluge; and many are of opinion, that Belus, who is supposed to be the same with Nimrod, was the first man that was deified.

But whether they had not paid divine honours to the heavenly bodies before that time, cannot be determined; our acquaintance with these remote things being extremely slender.

All that can be said with certainty is, that 426 years after the deluge, when God led Terah and his family out of Chaldea, and Abraham passed over Mesopotamia, Canaan, the kingdom of the Philistines, and Egypt, it does not appear that *idolatry* had then got any footing in any of those countries; though some idly pretend, that Abraham himself was an idolater.

The first mention we find made of it is, in Gen. xxxi. 19. where Rachel is said to have taken the idols of her father: for though the meaning of the Hebrew word THERAPHIM תרפים be disputed, yet it is pretty evident they were idols. Laban calls them his gods, and Jacob calls them strange gods, and looks on them as abominations.

The original of *idolatry*, by image worship, is by many attributed to the age of Eber, about 401 years after the deluge; though most of the fathers place it no higher than that of Serug; which seems to be the more probable opinion, considering that for the first 134 years of Eber's life all mankind dwelt in a body together, during which time it is not reasonable to suppose, that *idolatry* broke in upon them; then some time must be allowed after the dispersions of the several nations, which were but small at the beginning, to increase and settle themselves: so that if *idolatry* was introduced in Eber's time, it must have been towards the end of his life, and could not well have prevailed so universally, and with that obstinacy, which some authors have imagined. The authors of the Universal History think, that the origin and progress of *idolatry* is plainly pointed out to us in the account which Moses gives of Laban's and Jacob's parting, Gen. xxxi. 44, &c. From the custom once introduced of erecting monuments in memory of any solemn covenants, the transition was easy into the notion, that some deity took its residence in them, in order to punish the first aggressors; and this might be soon improved by an ignorant and degenerate world, till not only birds, beasts, stocks, and stones, but sun, moon, and stars, were called into the same office; though used, perhaps, at first, by the designing part of mankind, as scare-crows, to over-awe the ignorant. Univ. Hist. vol. i. part ii. p. 853. edit. fol.

Cluverius, German. Antiq. lib. i. maintains Cain to have been the first idolater; and the false gods that he worshipped to have been the stars, to whom he supposed God had left the government of the lower world: but this is mere conjecture.

Sanchoniathon, who wrote his Phœnician Antiquities, apparently with a view to apologize for *idolatry*, traces its origin to the descendants of Cain, the elder branch, who began with the worship of the sun, and afterwards added a variety of other methods of idolatrous worship: proceeding to deify the several parts of nature, and men after their death, and even to consecrate plants shooting out of the earth, which the first men judged to be gods, and worshipped, as those that sustained the lives of themselves and of their posterity. Cumberl. on Sanchon. p. 219, &c.

The Chaldæan priests, in process of time, being by their situation early addicted to celestial observations, instead of conceiving as they ought to have done concerning the omnipotence of the Creator and mover of the heavenly bodies, fell into the impious errors of esteeming them as gods, and the immediate governors of the world, in subordination, however, to the Deity, who was invisible, except by his works, and the effects of his power. Concluding that God had created the stars, and great luminaries, for the government of the world, partakers with himself, and as his ministers, they thought it but just and natural that they should be honoured and extolled, and that it was the will of God they should be magnified and worshipped. Accordingly they erected temples, or *sacella*, to the stars, in which they sacrificed and bowed down before them, esteeming them as a kind of mediators between God and man. Impostors afterwards arose, who gave out, that they had received express orders from God himself concerning the manner in which particular heavenly bodies should be represented, and the nature and ceremonies of the worship which was to be paid them. When they proceeded to worship wood, stone, or metal, formed and fashioned by their own hands, they were led to apprehend, that these images had been, in some way or other, animated or informed with a supernatural power, by supernatural means; though Dr. Prideaux imagines, that, being at a loss to know how to address themselves to the planets when they were below the horizon, and invisible, they recurred to the use of images. Dr. Prideaux's Connection, &c. book iii. p. 177. 8vo.

But it will be sufficient to suppose, that they were persuaded that each star or planet was actuated by an intelligence; and that the virtues of the heavenly body were infused into the image that represented it. It is certain, that the sentient nature and divinity of the sun, moon, and stars, was strenuously asserted by the philosophers, particularly by Pythagoras and his followers, (Diogen. Laert. lib. viii. p. 509.) and by the Stoics (Cicero, De Nat. Deor. lib. ii. cap. 15.) as well as believed by the common people, and was indeed the very foundation of the pagan idolatry. The heavenly bodies were the first deities of all the idolatrous nations, were esteemed eternal, sovereign, and supreme, and distinguished by the title of the natural gods. Thus we find that the primary gods of the heathen in general were Saturn, Jupiter, Mars, Apollo, Mercury, Venus, and Diana: by which we can understand no other than the sun and moon, and the five greatest luminaries next to these. Plutarch expressly censures the Epicureans for asserting that the sun and moon are void of intelligence, whom all men worshipped. Ad. Colotem. p. 1123.

Sanchoniathon (apud Euseb. Præp. Evan. lib. i. cap. 9) represents the most ancient nations, particularly the Phœnicians and Egyptians, as acknowledging only the natural gods, the sun, moon, planets, and elements; and Plato declares it as his opinion, that the first Grecians likewise held these only to be gods, as many of the barbarians in his time did. In Cratyl. p. 273. F. See also Herodot. lib. i. cap. 131. 138. lib. iii. cap. 16. Diod. Sic. lib. i. p. 10, 11. ed. Rhodom. Strab. Geogr. lib. xv. p. 732. Polyb. Hist. lib. vii. p. 699, 700. ed. Gronov. Euseb. Præp. Ev. lib. ii. cap. 2. p. 59. Even Philo (*Lib.* De Somniis) and Origen (in his books Περὶ Ἀρχῶν) maintain, that the stars are so many souls incorruptible and immortal. See Farmer on Miracles, chap. iii. § 2.

Besides these natural gods, the heathens believed, that there were certain spirits who held a middle rank between

the gods and men on earth, and carried on all intercourſe between them; conveying the addreſſes of men to the gods, and the divine benefits to men. Theſe ſpirits were called DÆMONS. From this imaginary office aſcribed to them, they became the grand objects of the religious hopes and fears of the pagans, of immediate dependence and divine worſhip. In the moſt learned nations, they did not ſo properly ſhare, as ingroſs the public devotion. To theſe alone ſacrifices were offered, while the celeſtial gods were worſhiped only with a pure mind, or with hymns and praiſes. As to the nature of theſe dæmons, it has been generally believed, that they were ſpirits of a higher origin than the human race; and, in ſupport of this opinion, it has been alledged, that the ſupreme deity of the pagans is called the greateſt dæmon; that dæmons are deſcribed as beings placed between the gods and men; and that dæmons are expreſly diſtinguiſhed from heroes, who were the departed ſouls of men. A late ingenious writer has with great acuteneſs and erudition combated this opinion, and maintained, on the contrary, that by dæmons, ſuch as were the more immediate objects of the eſtabliſhed worſhip amongſt the ancient nations, particularly the Egyptians, Greeks, and Romans, we are to underſtand beings of an earthly origin, or ſuch departed human ſouls as were believed to become dæmons. This, he ſays, is a fact atteſted by all antiquity, whether Pagan, Jewiſh, or Chriſtian. He appeals to the teſtimonies of the heathen hiſtorians, poets, and philoſophers, and to the nature of the worſhip paid to the heathen deities. He examines the authority of the Old Teſtament writers; of the authors of the Septuagint verſion; of Philo and Joſephus; of the New Teſtament; and of the Chriſtian fathers. For a farther view of the maſterly manner in which this argument is treated, ſee Farmer on Miracles, chap. iii. § 2. paſſim. Farmer on Dæmoniacs, § 2. See DÆMON and MIRACLES.

Voltaire, in the art. IDOLE, Encyclopedie, labours to vindicate the heathens in general from the charge of *idolatry*. He ſays, that there has not exiſted any people on earth who aſſumed the name of idolaters: and that no ſuch term is found in Homer, or Heſiod, or Herodotus, or any author of the pagan religion; and that no law was ever enacted, requiring the ultimate worſhip of idols. The Greeks and Romans, he ſays, were gentiles and polytheiſts, but not idolaters; they worſhipped the gods by means of theſe images, and not the images themſelves; and were no more chargeable with idolatrous worſhip than the votaries of the Romiſh church. He alſo extends his laboured and ſpirited vindication to the Perſians, Sabians, Egyptians, Tartars, and Turks; and obſerves, that it is an abuſe of terms to call theſe people idolaters who worſhip the ſun and ſtars, &c.

The principal cauſes that have been aſſigned for *idolatry* are, the indelible idea which every man has of God, and the evidence which he gives of it to himſelf; an inviolable attachment to the ſenſes, and a habit of judging and deciding by them, and them only; the pride and vanity of the human mind, which is not ſatisfied with ſimple truth, but mingles and adulterates it with fables; the ignorance of antiquity, or of the firſt times, and the firſt men, whereof we have but very dark and confuſed knowledge by tradition, they having left no written monuments or books; the ignorance and change of languages; the ſtyle of the oriental writings, which is figurative and poetical, and perſonifies every thing; the ſuperſtition, ſcruples, and fears, inſpired by religion; the flattery of writers; the falſe relations of travellers; the fictions of poets; the imaginations of painters and ſculptors; a ſmattering of phyſics, that is a ſlight acquaintance with natural bodies and appearances, and their cauſes; the eſtabliſhment of colonies, and the invention of arts, miſtaken by barbarous people; the artifices of prieſts; the pride of certain men, who have affected to paſs for gods; the love and gratitude borne by the people to certain of their great men and benefactors; and finally the Scriptures themſelves ill underſtood.

IDOLOPŒIA, *Εἰδωλοποιία*, in *Rhetoric*, a ſpecies of PROSOPOPŒIA, where dead perſons are ſuppoſed to ſpeak.

IDOLOTHYTA, *Εἰδωλόθυτα*, things offered in ſacrifice to idols; concerning the uſe of which, the apoſtle Paul lays down rules in 1 Corinth. chap. viii. ver. 4, 7, and 10.

IDULIA, in *Antiquity*, certain eggs offered to Jupiter on the idea of every month. They were ſo called, from their being offered on the ides.

IDYLLION, in *Poetry*, a little poem, containing the deſcription or narration of ſome adventures.

The word is derived from the Greek εἶδος, diminutive of *idea, figure, repreſentation*; becauſe this poetry conſiſts in a natural lively image, or repreſentation of things.

Theocritus is the oldeſt author who has written *idyllions*. The Italians imitate him, and have brought the *idyllion* into modern uſe.

The *idyllions* of Theocritus have a peculiar delicacy; they appear with a clowniſh, ruſtic kind of ſimplicity, but are full of the moſt exquiſite beauties; they ſeem drawn from the breaſt of nature herſelf, and to have been dictated by the graces.

The *idyllion* is a kind of poetry which paints the objects its deſcribes; whereas the epic poem relates them, and the dramatic acts them. The modern writers of *idyllions* do not keep up to that original ſimplicity obſerved by Theocritus; the people of our days would not bear an amorous fiction, reſembling the aukward gallantries of our peaſants. Boileau obſerves that the ſhorteſt *idyllions* are uſually the beſt.

The modern *idyllions* differ from thoſe of the ancients, by introducing none but allegorical ſhepherds, or courtiers diſguiſed in their dreſs; whereas thoſe of the ancients repreſent true ſhepherds. Mr. Hardion obſerves, that the taſte of the preſent age is ſo very different from that of the ancients in this reſpect, that he would not take upon him to give a literal tranſlation of Theocritus's *idyllions*; not that he reckons them bad in themſelves, nor that he condemns the rules followed in their compoſition; but becauſe the rules that were good at the time thoſe poems were written, would, in the preſent age, be rejected but by very few.

The ſubject of *idyllions*, as being low of itſelf, requires the greateſt elegance of diction to ſet it off. Mr. Hardion is of opinion, that Theocritus has the advantage of Virgil in this reſpect; obſerving always the ſtructure peculiar to paſtoral poems which conſtitutes one of its chief beauties. This ſtructure requires that the fourth foot of every verſe ſhould be a dactylus, and ſometimes alſo the firſt, when it can be done without affectation. Beſides, it is alſo neceſſary theſe dactyli ſhould be made without any cæſura following; and, if poſſible, there ſhould be a reſt in the ſenſe after each dactyle, which would add greatly to the regularity and perfection of each verſe. Such are the following verſes of Theocritus and Virgil:

Ἔιτε μοι, ὦ Κεχάρυλε, τόσσ' ἀς δοκεῖς, ἔφα Φιλώτας.
Theoc. Idyl. iv. ver. 1.

Die mihi, Damœta, cujum pecus? An Meliboei?
Virg. Ecl. iii. ver. 1.

This ſtructure in paſtoral poems gives a vivacity, which is wonderfully pleaſing in the mouth of a ſhepherd. Theſe rules are obſerved by Theocritus, with all the exactneſs poſſible; but by Virgil ſeldom, which is rather to be imputed to the genius of the Latin tongue than his want of ability; it being leſs copious, bold and pliant, than the Greek. Mem. Acad. Inſcript. tom. vi. p. 255. 256.

The invention of the *idyllion* is aſcribed to Daphnis, who by his extraordinary genius, ſays Diodorus Siculus, "invented the bucolic poem and ſong, in the form it continues to appear in at preſent, in Sicily." This paſſage is conſiderable, as it fully aſcertains the origin of the *idyllion*, ſuch as it appears in Theocritus, and thoſe that have imitated him.

After Daphnis, another Sicilian ſhepherd, called Diomus, made himſelf famous for his paſtoral poems. Next came Steſichorus, who, according to Ælian, was the firſt that made the misfortune of Daphnis the ſubject of his ſongs. He lived, as ſome chronologers will have it, in the time of Phalaris, about 560 years before the vulgar æra; and laſtly, ſome ages after this, Theocritus appeared, who forming himſelf on theſe firſt models, ſo far excelled, as to give paſtoral poetry all the perfection it was capable of receiving. Mem. Acad. Inſcript. tom. ix. p. 101.

JEALOUSY, in *Ethics*, is that peculiar uneaſineſs which ariſes from the fear that ſome rival may rob us of the affection of one whom we greatly love, or ſuſpicion that he has already done it. The firſt ſort of *jealouſy* is inſeparable from love, before it is in poſſeſſion of its object: the latter is often unjuſt, generally miſchievous, always troubleſome.

JEALOUSY, *waters of*. See WATERS.

JEAN-CAPELLE, in *Ichthyology*, a name given by Ruyſch, and ſome others, to the fiſh called by authors the *faber Indicus*, or *Indian* DORÉE; and more expreſſively named by Artedi the ZEUS with a forked tail.

JECARINUS *piſcis*, in *Ichthyology*, a name given by Gaza, and many other writers, to the fiſh more commonly called HEPATUS *piſcis*, by ſome *jecur marinum*.

JECTIGATION, in *Phyſics*, a trembling, palpitation, or diſorderly and convulſive motion of the whole body, of one ſide, or only of the heart and pulſe of a ſick perſon: this ſhews that the brain, which is the origin of the nerves, is attacked, and threatened with convulſions.

JECUR. See LIVER.

JECUR *marinum*, in *Ichthyology*, is uſed by Hermolaus and ſome other writers in the ſame ſenſe with HEPATUS.

JECUR *storiorum*. The PLACENTA is by some thus called, from the fuppofed fimilitude of its figure and office with that of the liver.

JEER *capftan*. See CAPSTAN.

JEERS, or JEARS, in a *Ship*, an aflemblage of tackles, by which the lower yards of a fhip are hoifted up along the maft to their ufual ftation, or lowered from thence as occafion requires; the former of which operations is called *hawjing*, and the latter *ftriking*.

In a fhip of war, the *jeers* are ufually compofed of two ftrong tackles, each of which has two blocks, viz. one faftened to the lower maft-head, and the other to the middle of the yard. The two blocks which are lafhed to the middle, or flings of the yard, are retained in this fituation by means of two cleats, nailed on each fide, whofe arms include the ropes by which the blocks are faftened to the yard. The two ropes which communicate with thefe tackles lead down to the deck on the oppofite fide of the maft, according to the fituation of the upper *jeer-blocks*. The *jeers* in merchant-fhips have ufually two large fingle blocks on the oppofite fide of the maft-head, and another of the fame fize in the middle of the yard. The rope which communicates with thefe, paffes through one of the blocks hanging at the maft-head, then through the block on the yard, and afterwards through the other hanging block upon the maft. To the two lower ends of this rope, on the oppofite fides of the maft, are fixed two tackles, each of which is formed of two double blocks, the lower one being hooked to a ring-bolt in the deck, and the upper one fpliced or feized into the lower end of the great rope above, which is called the tye. By this contrivance the mechanical power of the tackle below is tranfmitted to the tye, which, communicating with blocks on the yard, readily fways up or lowers it, either by the effort of both *jeers* at once, on the oppofite fides of the maft, or by each of them feparately one after another. Falconer.

They fay a man is brought to the *jeers*, when going to be punifhed at the *jeer-capftan*. This is done in the following manner; a capftan-bar being thruft through the hole of the barrel, the offenders arms are extended at full length crofs-wife, and fo tied to the bar; having fometimes a bafket of bullets, or fome other like weight, hanging by his neck. In this poflure he continues till he be either brought to confefs fome plot or crime, whereof he is fufpected; or that he has fuffered what he is fentenced to undergo, at the diferetion of the captain.

JEHAGH. See GIAGH

JEHOVAH, in *Theology*, one of the fcripture names of God, fignifying the being who is felf exiftent, and who gives exiftence to others. See GOD.

So great a veneration had the Jews for this name, that they left off the cuftom of pronouncing it; whereby its true pronunciation was forgotten. They call it TETRAGRAMMATON, or the name with four letters; and believe that whoever knows the true pronunciation of it, cannot fail to be heard by God.

JEJUNE *ftile*. See STYLE.

JEJUNUM, the fecond of the fmall guts; thus called from the Latin *jejunus, hungry*; becaufe always found empty. See INTESTINES.

JELLALÆAN, or GELALEAN *calendar, epocha*, and *year*. See CALENDAR, EPOCHA, and YEAR.

JELLY, a form of food, or medicine prepared from the juice of ripe fruits, boiled to a proper conſiſtence with fugar, or of the ſtrong decoctions of the horns, bones, or extremities of animals, boiled to ſuch a height as to be ſtiff and firm when cold, without the addition of any ſugar.

The *jellies* of fruits are cooling, ſaponaceous, and acefcent, and therefore are good as medicines in all diſorders of the primæ viæ, ariſing from alcalefcent juices, eſpecially when not given alone, but diluted with water. On the contrary, the *jellies* made from animal ſubſtances are all alcalefcent, and are therefore good in all caſes in which an acidity of the humours prevails: the alcalefcent quality of theſe is, however, in a great meaſure taken off, by the adding lemon juice and ſugar to them. There were formerly a ſort of *jellies* much in uſe, called *compound jellies*; theſe had the reſtorative medicinal drugs added to them, but they are now ſcarce ever heard of.

JELLY, *oat*, a preparation of common oats, recommended by many of the German phyſicians in all hectic diſorders, to be taken with broth of ſnails or cray-fiſh.

It is made by boiling a large quantity of oats, with the huſk taken off, with ſome hartſhorn ſhavings, and currants together, with a leg of veal cut to pieces, and with the bones all broken; theſe are to be ſet over the fire with a large quantity of water, till the whole is reduced to a ſort of *jelly*, which, when ſtrained and cold, will be very firm and hard. A few ſpoonfuls of this are to be taken every morning, diluted with a baſon of either of the mentioned broths, or any other warm liquor.

JEMBUTT, in the *Materia Medica*, a name uſed by Avicenna and others, to expreſs the foods in the pods of the carob-tree, or ſiliquis dulcis; which they call chærube or charnub, and the Greeks ceratium.

JENDAYA, in *Ornithology*, the name of a Braſilian ſpecies of perroquette. It is of the ſize of a black bird; its beak and legs are black, and its back, wings, and tail, are of a bluiſh green; the tips of its wings are blackiſh, and its head, neck, and breaſt, are of a pale yellow, with an admixture of a deeper yellow in ſome places. Margrave.

JENNET, in *Horſemanſhip*. See HORSE.

JENNY *worm*. See WARM.

JENTLING, in *Ichthyology*, the name of a river fiſh caught in the Danube, and moſt of the great rivers in Germany, and called by the Germans *ſchnid, ſchnat, jent*, and *koppen*; and by Gefner *capita cærulea*, the blue chub.

JEOFAILE, JEOFAYLE, in *Law*, a compound of three French words *je ay faillé, I have failed*. It is uſed in a legal ſenſe, when the parties to any ſuit have, in pleading, proceeded ſo far, that they have joined iſſue, which ſhall be tried, or is tried by a jury, and this pleading or iſſue is badly joined, ſo that it will be error if they proceed.

In this caſe, one of the parties might, by their counſel, ſhew it to the court, as well after verdict given, as before the jury was charged, by ſaying, *This inqueſt you ought not to take*; or, *To judgment you ought not to go*. But this occaſioning great delays in ſuits, for the redreſs thereof ſeveral ſtatutes were made; viz. 32 Hen VIII. cap. 30. by which it is enacted, "That if the jury "have once paſſed upon the iſſue, though afterwards "there be found a *jeofaile* in the pleading, yet ſhall "judgment be given according to the verdict of the "jury." Other ſtatutes have alſo been made relating to the ſame thing, in the time of queen Elizabeth and king James I.

The 18th Eliz. cap. 14. ordains, that after verdict given in any court of record, there ſhall be no ſtay of judgment or reverſal, for want of form in a writ, count, &c. or for want of any writ original or judicial; or by reaſon of inſufficient returns of ſheriffs, &c. But this is not to extend to appeals of felony, indictments, &c. By 21 Jac. I. cap. 13. if a verdict ſhall be given in any court of record, the judgment ſhall not be ſtayed or reverſed for variance in form between the original writ or bill, and the declaration, &c. or for want of averment of the party's being living; or becauſe the *venire facias* is in part miſawarded; for miſnomer of jurors; want of return of writs; or becauſe the return officer's name is not ſet to the return, &c. The ſtat. 16 & 17 Car. II. cap. 8. enacts, that judgment ſhall not be ſtayed or reverſed after verdict in the courts of record at Weſtminſter, &c. for default in form; or becauſe there are not pledges to proſecute upon the return of the original writ, or becauſe the name of the ſheriff is not returned upon it; for default of alledging the bringing into court of any bond, &c. or for the omiſſion of *vi et armis*, or *contra pacem*; miſtaking the Chriſtian name or ſurname of either party, or the ſum of money, day, month, or year &c. in any declaration or pleading, being rightly named in any record, &c. preceding, &c. &c. But all ſuch defects as are not againſt the right of the matter of the ſuit, or whereby the iſſue or trial are altered, ſhall be amended by the judges, though not in ſuits of appeal, or felony, indictments, informations on penal ſtatutes, which are excepted out of the act. The 22 and 23 Car. II. cap. 4. made this act perpetual. By 4 & 5 Ann. cap 16. all the ſtatutes of *jeofailes* ſhall extend to judgments, entered by confeſſion, *nil dicit, or non ſum informatus*, in any court of record; and no ſuch judgment ſhall be reverſed, nor any judgment or writ of inquiry of damages thereon ſhall be ſtayed, for any defect which would have been added by thoſe ſtatutes, if a verdict had been given; ſo as there had been an original writ filed, &c. The 5 Geo. I. cap. 13. ordains, that, after verdict given, judgment ſhall not be ſtayed or reverſed for defect in form or ſubſtance, in any bill or writ, or for variance therein, from the declaration, or any other proceedings.

JERBOA, in *Zoology*, is made a diſtinct genus of animals by Mr. Pennant, with two cutting teeth in each jaw, two very ſhort fore-legs, two very long hind-legs, reſembling thoſe of cloven-footed water-fowl, and a very long tail, tufted at the end. This genus comprehends the *mus ſaltans* of Linnæus, inhabiting Egypt, Barbary, Paleſtine, and the deſerts between Baſſora and Aleppo; the *mus longipes*, inhabiting the torrid zone; the Siberian *jerboa*, or flying hare, called alagtaga; and the Indian *jerboa*, or *le tarſier* of Buffon, inhabiting India. The Egyptian *jerboa* is repreſented *Tab.* III. *Quadrupeds*, N° 25.

JEREMIAH, in *Scripture Hiſtory*, a canonical book of the Old Teſtament. This divine writer was of the race of the prieſts; the ſon of Hilkiah of Anathoth, in the tribe

of

of Benjamin. He was called when very young to the prophetic office, about the thirteenth of Josiah; and continued in the discharge of it above forty years. He is said by St. Jerom, &c. to have been stoned to death by the Jews for preaching against their idolatry; but it is most likely that he died in Egypt, much advanced in years, and broken by the calamities which happened to himself and his country.

There were several collections of *Jeremiah*'s prophecies; One made by God's command in the fourth year of Jehoiakim, chap. xxxvi. 2. This contained all the prophecies he had published to that time, as well against the other nations as against the Jews. The former of these in the present collection are put by themselves at the end of the book from chap. xlvi. to the end of the last. But in the present copies of the Septuagint they follow immediately after the thirteenth verse of the twenty-fifth chapter. Another collection of these prophecies, mentioned chap. l. 3. comprehends all those which *Jeremiah* had uttered to the time of the captivity, and were probably collected by Baruch, his amanuensis, and are put together without any regard to the order of time. To this was added another collection of prophecies, published about the time of his going down into Egypt, contained in chap. xlii. xliii. xliv. at the end of which Ezra, or some others, after the captivity, added these prophecies which *Jeremiah* delivered against the Gentiles. The fifty-second chapter was probably added by *Ezra*, and is chiefly taken out of the latter part of the second book of Kings, with additions, which Ezra might supply out of the public records. The book of *Jeremiah* is altogether written in Hebrew, except the eleventh verse of the tenth chapter which is Chaldee.

St. Jerom has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal to those two prophets in the sense of this prophecy.

JERFALCON, the English name of the gyrfalco, a very fierce, bold, and large bird, the largest of all the falcon kind. See GYRFALCON.

JERGUER, in the *Custom House*, one who oversees the accounts and conduct of the waiters.

JERICHO, *rose of*, in *Botany*. See ANASTATICA.

JERKIN, a name given by some to the male of the jerfalcon. See GYRFALCON.

JERONYMITES, or HIERONYMITES, a denomination given to divers orders, or congregations of religious; otherwise called *Hermits of St. Jerom*.

The first, called *Hermits of St. Jerom* of Spain, owe their origin to the third order of St. Francis, whereof the first *Jeronymites* were members. Gregory the eleventh confirmed this order, under the name of St. Jerom, whom they had chosen for their patron, and their model; and gave them the constitutions of the convent of St. Mary of the Sepulchre, with the rule of St. Auguſtine; and for habit, a white tunic, with a scapulary, a little capuche, and a mantle all of a natural colour, without dying, and without a mean price.

The *Jeronymites* are in poſſeſſion of the convent of St. Laurence, in the Eſcurial, where the kings of Spain are buried.

In Spain there is likewiſe an order of nuns of St. Jerom, founded by a lady toward the cloſe of the fifteenth century. Sixtus put them under the juriſdiction of the *Jeronymites*, and gave them the conſtitutions of the monaſtery of St. Martha of Cordova, which were afterwards changed by Leo X. for thoſe of the order of St. Jerom.

Hermits of St. Jerom, of the Obſervance, or *of Lombardy*, were founded by Lupus d'Olmeto in 1424, in the mountains of Caſalla, in the dioceſe of Seville.

The third order of *Jeronymites* was founded by Peter Gambacorti, about the 1377; but the vows they made were only ſimple, till 1568, when Pius V. appointed them to be ſolemn. They have houſes in Tirol, Italy, and Bavaria.

The fourth congregation of *Jeronymites*, are the *Hermits of St. Jerom of Fiezoli*, begun in 1360, when Charles de Montegranchi, of the family of the count of that name, retiring into ſolitude, firſt eſtabliſhed it at Verona. It was approved by Innocent VII. under the title and conſtitutions of St. Jerom. But Eugenius IV. changed it for that of St. Auguſtine. As the founder was of the third order of St. Francis, they preſerved that habit; but, in 1460, Pius permitting ſuch as pleaſed to change it, occaſioned a diviſion among them. This order was finally ſuppreſſed by Clement XI. in 1668.

JERSEY, among *Woolcombers*, denotes the fineſt wool, taken from the reſt by dreſſing it with a *Jerſey* comb.

New JERSEY *tea*, in *Botany*. See CEANOTHUS.

JERTH, in the *Materia Medica*, a name given to a certain kind of moſs, according to Scheffer, growing very plentifully in Lapland, and other cold countries. The uſe of this is the part uſed in medicine, and the method of giving it is in decoction. They boil a large quantity of it in the whey made of rein deer's milk, and give the patient large draughts of it, warm, every hour or two; by that means keeping up a good perſpiration, which they increaſe or diminiſh according to the nature of the caſe. The principal diſeaſes to which they are ſubject are fevers, and the ſmall-pox; and it is wonderful to find how well they get through theſe two dangerous complaints by this regimen alone. And, upon the whole, the virtues of ſo much warm and diluting liquor ſeem the principal thing to be depended upon by them; for they cannot readily get the *jerth* root, they ſcruple not to ſupply its place with the ſtalks of angelica, and the decoction ſeems to ſucceed as well this way as the other, both in the ſmall-pox and other caſes.

JERUSALEM *artichoke*. See ARTICHOKE.

JERUSALEM *cowſlip*. See LUNG-*wort*.

JERUSALEM *oak*, a ſpecies of *chenopodium*. See GOOSE-*foot*.

JERUSALEM *ſage*. See SAGE-*tree*.

JESEN, in *Heraldry*. See JENTLING.

JESILBASCH, *green-head*, a name of reproach which the Perſians give to the Turks, becauſe their emirs wear a green turban.

JESSANT, formed from the obſolete French *jeſſer*, *to riſe* or *ſpring out*, in *Heraldry*, is applied to a fleur-de-lys, or the like figure, ſeeming to ſpring or ſhoot out of ſome other charge. He bears ſable; three leopard's heads; *jeſſant*, fleurs-de-lys, or.

JESSAMINE, or JESSAMY. See JASMINE.

JESSE, a large braſs candleſtick with many ſconces hanging down, in the middle of a church or choir. This invention was firſt called *jeſſe*, from the ſimilitude of the branches to thoſe of the *arbor jeſſæ*. This uſeful ornament of churches was firſt brought over into this kingdom by Hugh de Flory, abbot of St. Auſtin's in Canterbury, about the year 1100.

JESSES denote ribbons hanging down from garlands and crowns; alſo the ſhort ſtraps of leather, faſtened to a hawk's legs, and ſo to the vervels; and birds, in *Heraldry*, are ſaid to be *jeſſed*, when theſe *jeſſes* are of a different tincture from the other parts.

JESTING, or *conciſe wit*, as diſtinguiſhed from continued wit or HUMOUR, lies either in the thought, or the language, or both. In the firſt caſe it does not depend upon any particular words or turn of the expreſſion. But the greateſt ſund of jeſts lies in the language, i. e. in tropes or verbal figures; thoſe afforded by tropes conſiſt in the metaphorical ſenſe of the words, and thoſe of verbal figures principally turn upon a double ſenſe of the ſame word, or a ſimilitude of ſound in different words. The third kind of jokes, which lie both in the ſenſe and language, ariſe from figures of ſentences, where the figure itſelf conſiſts in the ſenſe, but the WIT turns upon the choice of the words. Ward's Orat. vol. ii. Lect. 40.

JESUATES, JESUATI, an order of religious, otherwiſe called *Apoſtolical Clerks*, or *Jeſuates of S. Jerom*.

They were founded by John Colombini, in 1368, and approved of by Urban V. in 1369, at Viterbo; where he himſelf gave, to ſuch as were preſent, the habit they were to wear.—They followed the rule of St. Auguſtin, and were ranked by Pius V. among the order of Mendicants.

They were called *Jeſuates*, becauſe their firſt founders had the name of Jeſus continually in their mouths: to which they added the name of St. Jerom, becauſe they choſe that ſaint for their protector.

For two centuries the *Jeſuates* were mere lay-brothers; but in 1606. Paul V. gave them leave to enter into holy orders.—In moſt of their houſes they were employed in pharmacy, diſtributing their medicines gratis; others practiſed diſtillation, and ſold aqua vitæ; which occaſioned their being called *aquavitæ-mongers*.

Being very rich in the ſtate of Venice, that republic ſolicited their ſuppreſſion, and obtained it of Clement IX. in 1668, their effects being employed towards ſupporting the expences of the war in Candia.

JESUITS, an order of religious, founded by Ignatius Loyola, a Biſcayan military gentleman, of a fanatical and ambitious ſpirit, called alſo *the Society of Jeſus*.

They are alſo ſometimes called *Loyolites*, and ſometimes *Inighiſts*, from the Spaniſh name of their founder, which was *Inigo de Guipuſcoa*.

This order, which was the moſt political and beſt regulated of all the monaſtic orders, and from which mankind have derived more advantages, and received greater hurt, than from any other of theſe religious fraternities, has rendered itſelf very conſiderable by its miſſions into the

the Indies, and by its other employments relating to the study of the sciences, and the education of youth. The council of Trent calls them, *Regular Clerks of the Company of Jesus*.

In the year 1538, Ignatius, having assembled ten of his companions at Rome, chosen mostly out of the university of Paris, proposed to them to make a new order. After this, he presented the plan of his institution, suggested as he gave out, and his followers still teach, by the immediate inspiration of heaven, to Paul III. who appointed a committee of cardinals to examine it; upon whose report, that the establishment was unnecessary as well as dangerous, Paul refused to approve it. This opposition was principally urged by the learned and worthy cardinal Guidiccioni.

This opposition was vanquished by the dexterity of Ignatius, who proposed, that besides the three vows of poverty, chastity, and monastic obedience, the members of this society should take a fourth vow of obedience to the pope; binding themselves to go whithersoever he should command, for the service of religion, and without requiring any thing from the holy see for their support. However, Ignatius and his company in the same charter of their order in which they declare their implicit and blind allegiance to the court of Rome, promise a like implicit and unlimited allegiance to the general of their society. The pontiff, perceiving this institution to be an object of consequence, confirmed it, under the name of the *Company of Jesus*, by a bull in 1540; and appointed Ignatius Loyola to be the first general of the order. Loyola was originally an illiterate soldier, and is supposed by many to have been only a flexible instrument in the hands of able and ingenious men, who made use of his fortitude and fanaticism to answer their purposes, and persons much more learned were employed to compose the writings which bear his name. Geddes's Tracts, vol. iii. p. 429.

By this bull, their number was restrained to sixty; but that restriction was taken away, two years afterwards, by another bull. The order has since been confirmed by several succeeding popes, who have added many new rights and privileges to it.

In less than half a century after its institution, the society obtained establishments in every country that adhered to the Roman Catholic church; in the year 1608, the number of *Jesuits* had increased to 10581. In the year 1710, the order possessed 24 professed houses; 59 houses of probation; 340 residencies; 612 colleges; 200 missions; 150 seminaries and boarding-schools; and consisted of 19,998 *Jesuits*.

The constitution and laws of the society were perfected by Laynez, and Aquaviva, the two generals who succeeded Loyola, men far superior to their master in abilities, and in the science of government. Several circumstances concurred to the rapid progress and extensive influence of the *Jesuits*. They were taught to consider themselves as formed for action, and bound to exert themselves continually, as soldiers, in the service of God and of the pope, his vicar on earth. And that they might have full leisure for this active service, they were totally exempted from those functions, the performance of which is the chief business of other monks. They were required to attend to all the transactions of the world; to study the dispositions of persons in high rank, and to cultivate their friendship; and by the constitution as well as genius of the order, a spirit of action and intrigue was infused into all its members. Besides, the form of government of this order was peculiar: Loyola, full of the ideas of implicit obedience, which he had received from his military profession, appointed that the government of this order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them at pleasure. To him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrolable mandate, he could impose upon them any task, or employ them in whatsoever service he pleased. To his commands they were required to yield not only outward obedience, but to relign to him the inclinations of their own wills, and the sentiments of their own understandings. There is not in the annals of mankind any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth. It is carefully provided, that the general should be perfectly informed with respect to the character and abilities of his subjects. Every novice, who offers himself a candidate for entering into the order, is obliged to manifest his conscience to the superior, or to a person appointed by him every six months: each member is likewise enjoined to observe the words and actions of the novices, and to disclose every thing of importance to the superior. The provincials and heads of the several houses are also obliged to transmit to the general, regular, frequent, and minute reports concerning the members under their inspection. These reports are digested and arranged in registers, by which the general may easily survey the state of the society in every corner of the earth; observe the qualifications of its members; and chuse proper instruments for any necessary service. The number of these reports received annually by the general was 6584, which divided by 37, the number of provinces in the order gives 177 reports concerning the state of each province transmitted annually to Rome. The general also receives, by the constitution of the order, an account of the civil affairs of the country where his subjects reside; so that he is furnished with full information concerning the transaction of every prince and state in the world. The *Jesuits*, from their first institution, considered the education of youth as their peculiar province; and before the expiration of the 16th century, they had obtained the chief direction of this business in every catholic country in Europe. They had also become the confessors of almost all its monarchs; they were the spiritual guides of almost every person eminent for rank or power; and they possessed the highest degree of confidence and interest with the papal court, as the most zealous and able champions for its authority. The order, notwithstanding the vow of poverty which they contrived to elude, acquired ample possessions in every catholic country. Besides the sources of wealth common to all the regular clergy, they obtained, under a pretext of promoting the success of their missions, and of facilitating the support of their missionaries, a special licence from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce, both in the East and West Indies; they also aimed at obtaining settlements; and accordingly acquired possessions of a large and fertile province in the southern continent of America, and reigned as sovereigns over some hundred thousand subjects.

The progress and influence of the *Jesuits* have been likewise much promoted by their mutual union for the good of the common cause; by their reputation for learning and science, in which they excel all the other orders, though M. d'Alembert says, that the order has never produced one man, whose mind was so much enlightened with sound knowledge as to merit the name of a philosopher; by the severity of their discipline and regularity of their conduct and manners; by propagating a system of relaxed and pliant morality, which accommodates itself to the passions of men, justifies their vices, tolerates their imperfections, and authorizes almost every action, which the most audacious or crafty politician would wish to perpetrate. So that abbé Boileau says of them, they are a people who lengthen the creed and shorten the decalogue; by extending the jurisdiction and absolute power of the court of Rome; and by the zeal which they have manifested in combating the opinions and checking the progress of the protestants.

The end principally proposed by this order is, to gain converts to the Romish church; with which view they disperse themselves in every country and nation, and with amazing industry and address pursue the end of their institution. No difficulty so great that they cannot surmount, no danger so imminent that they will not undergo; and, as some say, no crimes so shocking that have not been perpetrated by them for the service of their cause.

Of all the *Jesuits*, who distinguished themselves by their zealous and laborious attempts to extend the limits of the church, none acquired a more shining reputation than Francis Xavier, commonly called the apostle of the Indians. He sailed for the Portuguese settlements in India in 1522, and soon diffused the knowledge and profession of the popish religion over a great part of the continent and neighbouring islands. In 1529 he laid the foundations of a considerable church in Japan; against which, however, a violent persecution was commenced in 1613, and lasted several years, and terminated in the utter extirpation of Christianity, and an edict forbidding all Europeans, a few Dutch merchants excepted, to approach the Japanese dominions; and having embarked for China, he died in 1552, within sight of it. Others, after his death, and particularly Ricci, an Italian, penetrated into China, and established churches, some remains of which subsist to this day. Robert de Noblli is much celebrated by the *Jesuits* on

account of his success in proselyting the BRACHMANS; for the method he used see BRACHMANS. The *Jesuits* are charged by the Jansenists and Dominicans with many fraudulent practices in their attempts to propagate Christianity in China; and particularly with endeavouring to persuade the Chinese, that the doctrine of Confucius and that of the gospel were not essentially different, and that Jesus Christ had been known and worshipped in their nation many ages ago. Ricci allowed the Chinese converts to retain the profane customs and the absurd rites of their pagan ancestors; but his opinion was condemned by the Dominicans and Franciscans. This difference laid the foundation of a long and violent conteſt. Innocent X. in 1645, pronounced ſentence in favour of the Dominicans; but, about eleven years after, Alexander VII. granted the Chineſe the indulgence propoſed by Ricci. Complaints were renewed by the Dominicans in 1661, and again in 1674, under the pontificate of Innocent XI; and the diſpute was carried on both in Europe and China, from the year 1684, till the queſtion was decided to the diſadvantage of the *Jeſuits* in the year 1704, by Clement XI. but this edict was mitigated in 1715. It is well known, that the inquiſition erected by the *Jeſuits* at Goa, where the body of Xavier lies interred, and is worſhipped with the higheſt marks of devotion, and the penal laws, which terrors they employed to freely in propagation of the goſpel, contributed much more than their arguments and exhortation, which were but ſparingly uſed, to engage the Indians to embrace Chriſtianity.

About the beginning of the laſt century, the *Jeſuits* obtained admiſſion into the ſettle province of Paraguay, in South America, where they found the inhabitants in a barbarous and ſavage ſtate; they began with inſtructing and civiliſing them; cultivating amongſt them the arts and manufactures, and accuſtoming them to the bleſſings of ſociety, ſecurity and order. By this method they ſecured their eſteem and confidence; and a few *Jeſuits* preſided over ſome hundred thouſand Indians. However, it appears from the moſt credible relations, that they ſoon changed their views from the propagating of Chriſtianity, to ſchemes of inſatiable avarice and boundleſs ambition: and they have ſent yearly to the members of their order, in Europe, immenſe quantities of gold, drawn from ſeveral American provinces where they have power and property, but chiefly from Paraguay, which belongs to them only: and it is evident, from later diſcoveries, which have proved the ruin of the *Jeſuits* in Spain and Portugal, that they had eſtabliſhed an independent empire in this province, ſubject to their ſociety alone, and which, by the ſuperior excellence of its conſtitution and police, could ſcarcely have failed to extend its dominions over all the ſouthern continent of America. They cut off every kind of communication between the Spaniards and Portugueſe in the adjacent ſettlements, and the Indians; inſpired the latter with hatred and contempt of theſe nations; induſtriouſly avoided giving the Indians any knowledge of the Spaniſh, or other European languages; inſtructed them in the art of war; formed them into bodies of cavalry and infantry, and provided them with artillery and magazines ſtored with all the implements of war. Such was the ſtate of things, when, in the year 1750, the courts of Madrid and Liſbon entered into a treaty for fixing the limits of their reſpective dominions in South America. In the execution of the treaty, in the year 1752, the *Jeſuits* demurred; and a war enſued between the Spaniſh and Portugueſe on one ſide, and the Indians, animated by the *Jeſuits*, on the other; which was the real and original cauſe of the diſgrace of the *Jeſuits* at the court of Portugal.

The *Jeſuits* have been juſtly charged with inculcating the moſt iniquitous and dangerous maxims with regard to morality and religion: ſuch are the following extracted from their writings. That perſons truly wicked and void of the love of God, may expect to obtain eternal life in heaven, provided that they be impreſſed with a fear of the divine anger, and avoid all heinous and enormous crimes through the dread of future puniſhment: that thoſe perſons may tranſgreſs with ſafety, who have a probable reaſon for tranſgreſſing, *i. e.* any plauſible argument or authority in favour of the ſin they intend to commit: that actions intrinſically evil, and directly contrary to the divine laws, may be innocently performed, by thoſe who have ſo much power over their own minds, as to join, even ideally, a good end to this wicked action, viz. to ſpeak in their ſtyle, who are capable of effecting their intention at leaſt: that philoſophical ſin is of a very light and trivial nature, and does not deſerve the pain of hell: by philoſophical ſin they mean an action contrary to right reaſon, which is done by a perſon who is either abſolutely ignorant of God, or does not think of him during the time that action is committed: that the tranſgreſſions committed by a perſon hurried by the ſeduction of luſt, agitated by the impulſe of tumultuous paſſions, and deſtitute of all ſenſe and conſideration of religion, however deteſtable and heinous they may be in themſelves, are not imputable to the tranſgreſſor before the tribunal of God; and that ſuch tranſgreſſions may often be as involuntary as the actions of a madman: and that the perſon who takes an oath, or enters into a contract, may, to elude the force of the one, and the obligation of the other, add to the words his words that expreſs them, certain mental reſtrictions and tacit reſervations. Some of theſe maxims were condemned by a public edict of pope Alexander VII. in 1659; and that relating to philoſophical ſin, by the ſame late in 1690, under the pontificate of Alexander VIII. Neither of theſe bulls are to be found in the *Bullarium Pontificum*; but they are induſtriouſly preſerved by the Janſeniſts and Dominicans. The cool, moraliſing of the *Jeſuits* was humorouſly and learnedly attacked by the famous Paſcal, in his work entitled, Les Provinciales, ou Lettres écrits par Louis de Montalte, à un Provincial de ſes Amis et aux *Jeſuites*, ſur la Morale et la Politique de ces peres. The *Jeſuits*, however, obtained a ſentence againſt the *Provinciales*, by which they were condemned to be burnt publicly at Paris. Another excellent book, by Perrault, publiſhed at Mons, in 3 volumes 8vo, in the year 1702, entitled, La Morale des *Jeſuites*, extrait fidelement de leurs Livres, imprimés avec la permiſſion et l'approbation des ſuperieurs de leur Compagnie, par un docteur de Sorbonne, was burnt at Paris, in the year 1670, at the requeſt of the *Jeſuits*. The famous Arnauld, with ſome of his Janſeniſt brethren, have undertaken to prove, that the *Jeſuits* reduced their pernicious maxims to practice, in a celebrated work, entitled, La Morale Pratique des *Jeſuites*, conſiſting of 8 volumes 8vo, the ſecond edition of which was publiſhed at Amſterdam, in the year 1742. For an account of the controverſy between the *Jeſuits* and *Janſeniſts*, ſee JANSENISTS.

The *Jeſuits* have no particular habit; but change and accommodate it to times and occaſions. The order conſiſts of five different claſſes; *profeſſed fathers*, *ſpiritual coadjutors*, *approved ſcholars*, *lay brothers*, called alſo *temporal coadjutors*, and *novices*. Some writers make only three claſſes, viz. the *profeſſed members*, the *ſcholars*, and the *artiſts*. Some add a ſixth claſs, under the title of *aſſociates*, which they ſay is numerous, and is incorporated with the other claſſes, and diſguiſed under different ſorts of apparel.

The *profeſſed fathers*, which make the body of the company, take the three ſolemn vows of religion publicly, and to theſe add a ſpecial vow of obedience to the head of the church, as to what regards miſſions among idolaters, heretics, &c.—The *ſpiritual coadjutors* alſo make public vows of chaſtity, poverty, and obedience; but omit the fourth relating to miſſions.—*Approved ſcholars* are thoſe, who, after two years noviciate, have been admitted, and have made three vows of religion; not ſolemn, indeed, but yet declared. Theſe are in the way to become profeſſed, or ſpiritual coadjutors, according as the general thinks fit. Theſe degrees, eſpecially that of profeſſed, are never conferred till after two years noviciate, and ſeven years ſtudy, ſeven of regency, a third year of noviciate, and thirty-three years of age: the age at which our Saviour is ſuppoſed to have been crucified. The vows of the ſcholars are abſolute on their ſide, but on y conditional on the ſide of the order; the general having it in his power to diſpenſe with them.

The order is divided into *aſſiſtances*, the aſſiſtances into *provinces*, and the provinces into *houſes*. It is governed by a general, who is perpetual and abſolute. He reſides at Rome, and is elected by a general congregation of the order. He has with him five perſons, who are, as it were, his miniſters. They are called *aſſiſtants*, and bear the name of the kingdom or country to which they belong, and by which they are appointed; viz. of Italy, France, Spain, Germany, and Portugal. To theſe belongs the care of preparing the matters of their reſpective aſſiſtances, and of putting them in a method to eſtimate their diſpatch.

Each province has four kinds of *houſes*, viz. *profeſſed houſes*, which can have no lands belonging to them; *colleges*, where the ſciences are taught; *profeſſed houſes*, which are a number of women employed in ſuch offices as have any immediate relation to preaching, confeſſion, miſſions, &c. and *houſes of nurſery*. Among the colleges there are ſome called ſimply *colleges*, and others *ſeminaries*. Theſe laſt are ſet apart for the young *Jeſuits*

to go through their courſes of philoſophy and theology in; the others are for ſtrangers.

Each province is governed by a *provincial*, and each houſe by a *ſuperior*; who is called *rector* in the colleges, and a *ſuperior* in the other houſes. Ignatius regulated the diſcipline of theſe houſes, and eſpecially of the colleges, by what he had obſerved in the Sorbonne, while he ſtudied at Paris.

The profeſſed of this order renounce, by a ſolemn vow, all preferment, and eſpecially prelacy; and cannot receive any, unleſs enjoined thereto by the pope, under pain of ſin. This the pope ſometimes does; inſomuch that they have had eight cardinals of their order.

The reader will find, in the preceding part of this article, a brief, but comprehenſive account of the *Jeſuits*, as to their origin and influence, and the chief cauſes on which their influence depended, and the nature of their conſtitution: it remains to direct his views to their decline and actual ſuppreſſion, in ſome parts of Europe, where their credit, power, and opulence had at one time arrived to a prodigious height. In *France*, the aſſaſſination of Henry IV. by Jean Chatel, one of their ſcholars, and the writings of the *Jeſuit* Guignard, in favour of regicide, induced ſeveral of the parliaments of the provinces to expel them, as a deteſtable and diabolical ſociety, the corruptors of youth, and enemies to the king and ſtate. But they were again favoured by Louis XIII. and Cardinal Richelieu, and alſo by Louis XIV: in whoſe reign they obtained the revocation of the edict of Nantes againſt the proteſtants, and ſucceeded almoſt to their utmoſt wiſhes in ſuppreſſing the JANSENISTS, their inveterate enemies. However, at this period, their affairs ſeem to have taken a different turn. Father Telliet's violence in deſtroying the famous Port-Royal, and the univerſal commotion occaſioned by the bull UNIGENITUS, raiſed clamours againſt them, which never ſubſided till their ruin. The refuſal of the ſacrament to the Janſeniſts ſerved alſo to light up the flame which ſucceeded, and before it could be extinguiſhed, effected the diſſolution of the *Jeſuits*. About this time, they alſo refuſed, as it is ſaid, out of reſpect to the queen and dauphin, to undertake the ſpiritual guidance of La Pompadour: and whilſt they offended the court by their ſcruples, they diſpleaſed it equally by their intrigues, laying ſnares for diſgracing perſons in place, whoſe only crime was a diſregard for their ſociety. They alſo offended the men of letters by their violent declamations againſt the *Encyclopedie*, and by their abuſe of Voltaire, the author of the Henriade. In this ſituation of the *Jeſuits*, the war broke out between England and France, which involved the ſociety in that famous law-ſuit, which directly brought on its deſtruction. Having carried on a conſiderable commerce in the iſland of Martinico, and ſuſtained ſome loſſes by the war, they wanted to compound their debts with their correſpondents in Lyons and Marſeilles. Theſe correſpondents, looking upon the ſociety in general to be anſwerable for their brethren in Martinico, addreſſed themſelves to a certain *Jeſuit* in France, demanding juſtice. This good father, and the *Jeſuits* in general, demurred, and ſtood trial before the grand-chamber of the Parliament of Paris, where they were caſt; and not only ſentenced to pay the immenſe ſums in litigation, but interdicted for the future all manner of commerce. This ſentence led into an examination of their conſtitution by their own books; which appeared to be contrary to the laws of the kingdom, the obedience due to the king, the ſafety of his perſon, and the peace of the ſtate. Beſides the *Jeſuits* were grown rich, inſolent, and imperious; and though they profeſſed to have renounced the world, they were found to be tutors, courtiers, merchants, politicians, priefts, and wanted nothing leſs than to be governors and rulers of the earth. Theſe were ſufficient motives for ſuppreſſing them: the attempt to aſſaſſinate the French king in 1759, was charged on the *Jeſuits*; and the actual aſſaſſination of the king of Portugal in the following year, which induced the Portugueſe miniſter to drive them all out of the kingdom, in 1759, increaſed the odium againſt them. The parliament of Paris having taken a whole year to enquire into the nature of their inſtitution, and news of the capture of Martinico in the mean while arriving, the miniſter, as M. d'Alembert ſays, in order to cauſe a diverſion, thought on the expedient of proceeding farther againſt the *Jeſuits*; and the principal of their college was commanded to obey the arrets of parliament, and to ſhut up their ſchools on the firſt of April, 1762. On the 6th of Auguſt following, their inſtitution was unanimouſly condemned by the parliament, without any oppoſition on the part of the ſovereign; the ſociety was of courſe diſſolved; and their poſſeſſions alienated and ſold: the other parliaments of the kingdom following ſooner or later the example of that of Paris; nay ſome of them acted with ſtill greater ſeverity, driving them out of their provinces without ſtanding upon forms of law. In general, however, individuals were permitted to reſide in France, on renouncing the ſociety, and taking oaths of allegiance to the king. In a little while after, the king iſſued an edict, which aboliſhed the ſociety throughout all France. The parliament of Paris, on regiſtering this new edict, ordained the *Jeſuits* to reſide each in his own diocele, and to preſent themſelves every ſix months before the magiſtrate of the place in which they ſhall dwell. The ſame arret forbids them to come within ten leagues of Paris, and baniſhes them at leaſt ſix leagues from Verſailles, but prohibits them not from dwelling at Fontainbleau and Compiegne, where the court reſides at leaſt three months in the year. See on the ſubject of this article Moſheim's Eccl. Hiſt. vol. iii. p. 406, &c. 467, &c. vol. iv. p. 206, &c. 364, &c. Engliſh ed. 8vo. Robertſon's Hiſt. Ch. V. vol. iii. p. 65, &c. 8vo. JESUIT'S *bark*. See CORTEX *Peruvianus*.

falſe JESUIT'S *bark*, a name ſometimes given to a ſpecies of TANZU. See IVA.

JESUITESSÆ, in the *Romiſh Church*, an order of nuns which followed the rule of the Jeſuits, which was ſuppreſſed by pope Urban VIII. in the year 1630.

JESUS, in *Ichthyology*, a name given by the people of Dantzick to the fiſh called by Geſner the blue chub, or capito cæruleus. It is called alſo *ſoſe*, *ſoſen*, and *ſoſtz*.

JESUS, *Fathers of the oratory of*. See ORATORY.

JET, *gagates*, in *Natural Hiſtory*, the name of a foſſil ſubſtance, the characters of which are theſe: it is a ſolid, dry, opake, inflammable body, found in large detached maſſes of a fine and regular ſtructure, having a grain like that of wood, ſplitting more eaſily horizontally than in any other direction, very light, and moderately hard, not fuſible, unleſs in a moderately ſtrong heat, but readily inflammable, and burning a long time with a fine greeniſh white flame, and bituminous ſmell. Its ſpecific gravity is 1.744.

Jet has been often confounded with the common cannel coal, though a proper conſideration of their diſtinguiſhing characters is ſufficient to eſtabliſh the difference between them.

Jet is always found in detached maſſes lodged in other ſtrata; cannel coal conſtitutes of itſelf whole ſtrata. *Jet* has the grain of wood, and ſplits horizontally much more eaſily than in any other direction; cannel coal has no peculiar grain, and ſplits with equal eaſe any way. *Jet* is but moderately hard, cannel coal not leſs ſo than many ſtones; and *jet* when ſet on fire flames a long time, cannel coal but a little while. *Jet* is found in Italy, Germany and the Eaſt Indies, but no where ſo plentifully as in England; it is very common in Yorkſhire, and other of the northern counties, and is found in many of our clay pits about London.

By diſtillation *jet* yields firſt an acid liquor, then a thin and afterwards a thick black oil. By friction it becomes electrical, as AMBER does.

Jet, in medicine, is highly praiſed by the antients, but the modern practice has never enquired whether juſtly or not. Dioſcorides tells us, that it is an excellent emollient and diſcutient; he recommends a fumigation of it for diſeaſes of the womb, and ſays that water, in which burnt *jet* has been quenched, is a cordial. Aetius orders it to be extinguiſhed in wine for the ſame purpoſe. It has been much uſed by the perfumers.

There is alſo a fictitious *jet*, made of glaſs, in imitation of the mineral *jet*: this is now uſually drawn out into long hollow threads, which are cut and faſhioned at pleaſure.—It is much uſed in embroideries, and in the trimmings of mourning, and muſt be made of any colour, though it is uſually black, and white; and of late is denominated *hyper*.

JET D'EAU, a French word, ſignifying a fountain that cauſs up water to any conſiderable height in the air. See *Hydraulic laws of* FLUIDS.

It is well known, that a *jet d'eau* will never raiſe water ſo high as its reſervoir; and therefore gives leſs water than if it went to the full height. Of this phenomenon, there are ſeveral cauſes: the firſt is, that the velocity of the lower particles of the *jet* is greater than the velocity of the upper; and therefore the lower water ſtrikes that which is next above it; and as fluids move every way, by its impulſe, widens and conſequently ſhortens the column. Another cauſe is, that the water at the top of the *jet* does not immediately fall off, but forms a kind of ball or head, the weight of which depreſſes the *jet*; if the *jet* be a little inclined, it will play higher, but be leſs beautiful: beſides, the friction againſt the ſides of the bale of the ſquare, or ſpouting pipe, will make a ſmall *jet* riſe to a leſs height than a larger one from the ſame

fame reservoir. To remedy this inconvenience, the spouting holes should be increased in proportion to the height of the spouting water, provided that they are not made too wide for the pipe of conduct. The fourth cause is the air's assistance, which is proportional to the square of the velocity, with which the water of the *jets* of different heights strike it; and, therefore, the deficiency in height being in the same proportion, a *jet* that plays with a double velocity will have that deficiency four times at great, &c. Thus if a *jet* of five feet high loses one inch in height, by coming from a reservoir of five feet one inch high, a *jet* produced from a reservoir of ten feet four inches, will rise but ten feet; and in this manner a table might be easily formed shewing by what height of reservoirs *jets* of a determinate height may be produced. The following table shews in feet and decimals, of a foot, what *jets* will be produced by reservoirs of a determinate height.

Jet.	Jet.	Jet.	Jet.	Jet.	Jet.	Jet.
5	4,91	22	20,58	39	34,63	56	48,74	73	62,71	90	76,48

By various experiments that have been made by Mr. Mariotte, Dr. Desaguliers, and others, it has been found, that if the reservoir be five feet high, a conduct-pipe 1 inch diameter will admit a hole in the ajutage from $\frac{1}{2}$ of an inch to $\frac{1}{3}$ of an inch; and so on as in the following table.

Height of Reservoir.	*Diameter of the Ajutage.*	*Diameter of the Pipes of Conduit*
5 Feet	$\frac{1}{2}$ to $\frac{1}{3}$	1 inch.
10	$\frac{1}{2}$ to $\frac{1}{4}$ inch	2 inches.
13	$\frac{1}{2}$ an inch	2 $\frac{1}{2}$ inches.
20	$\frac{1}{2}$ an inch	2 $\frac{1}{2}$ inches.
25	$\frac{1}{2}$ an inch	2 $\frac{1}{2}$ inches.
30	$\frac{1}{2}$ to $\frac{1}{3}$ of an inch	3 inches, or 3$\frac{1}{2}$.
40	$\frac{1}{2}$ of an inch	4 $\frac{1}{2}$ inches.
50	$\frac{1}{2}$ of an inch	5 inches.
60	1 inch	5 $\frac{1}{2}$ inches or 6.
80	1 $\frac{1}{2}$ inch	6 $\frac{1}{2}$ inches or 7.
100	1 $\frac{1}{2}$ or 1$\frac{1}{3}$ inch	7 or 8 inches.

Here the *jet* is supposed to be within 100 or 150 yards of the reservoir; but if the conduct-pipe much exceeds this length, it must be of a larger diameter than what is here assigned. Thus for *jets* from $\frac{1}{2}$ of an inch to those of an inch and $\frac{1}{2}$, and from reservoirs from 40 to 90 feet height, if the distance be from 150 yards to $\frac{1}{2}$ of a mile, the diameter of the pipe should be of 6 inches; from $\frac{1}{2}$ of a mile to two miles, it must be of 7 inches; and from 2 miles to 3, it must be of 8 inches diameter for the same *jet*.

If it be required to keep any number of *jets* playing, whose ajutages are given in diameter, by one common conduct-pipe, we must find the diameter of an ajutage equal to all the given ones. Thus, if there be four ajutages of $\frac{1}{2}$ of an inch diameter each, then the square of $\frac{1}{2}$ is $\frac{1}{4}$, which multiplied by the number of ajutages 4, makes $\frac{4}{4}$; the square root of which is $\frac{2}{2} = 1$ 4 = the diameter of the ajutage equal to all the four small ones. A pipe of conduct of 10 inches diameter will supply all the *jets*, as being a little more than six times as great as the diameter of the one large ajutage now found. After this manner the dimensions of a conduct-pipe may be found in any other number of ajutages.

In order to make a *jet* play in the greatest possible height, the part of the conduct-pipe at the ajutage should not turn up at right angles, but with a gentle easy curve: for the best structure of the ajutage, see AJUTAGE. See also FOUNTAIN. Desaguliers' Course of Exp. Phil. vol. ii. lect. vii. annot.

JET *rings*, annular pieces of *jet* of large dimensions, found in many parts of England, and esteemed Roman antiquities. They are of different kinds; some being plain, others wrought, but all of them are much too large for rings. The smallest of them are three inches in diameter; yet the bore is not above an inch and a half, which makes them so much too small for the wrist, as they are too large for the fingers.

JETAIBA, in *Botany*, the name given by some authors to the trees which afford the gum anime of the shops.

JETSON. See FLOTSON.

JETTY-*head*, in the *royal dock-yards*, is a name usually given to that part of a wharf, which projects beyond the rest; but more particularly the front of a wharf, which side forms one of the cheeks of a *wet* or *dry* DOCK.

JEWEL-*blocks*, in a *ship*, are two small blocks, which are suspended at the extremity of the main and fore-main-yards, by means of an eye-bolt, driven from without to the middle of the yard-arm, parallel to its axis. The use of these blocks is to retain the upper part of the main-mast-studding-sails beyond the sheets of the top-sails, so that each of these sails may have its full force of action, which would be diminished by the encroachment of the other over its surface.

JEWEL-*office*, or JEWEL-*house*, an office which takes care of fashioning and weighing the king's plate, and delivering it out by warrants from the lord chamberlain. When his majesty makes any present of plate, &c. they have the charge of providing it; with some other things less material.

The principal officers are, the *master of the jewel-office*, whose patent fees are 450*l.* per ann. a *yeoman*, a *groom*, and a *clerk*; all in the king's gift.

There are also in this office, in the gift of the lord chamberlain, the poet-laureat, at 100*l.* per ann. salary; the king's historiographer, at 200*l.* per ann. the history painter, and principal painter, at 200*l.* per ann. the painter in enamel, and the surveyor and keeper of the pictures, at 200*l.* per ann. each.

The *goldsmith* and *jeweller* are employed by the master, and are usually in his gift.

JEWS, are those who profess obedience to the laws and religion of Moses. See JUDAISM.

By stat. 1 Ann. st. 1. c. 30. if Jewish parents refuse to allow their proselyte children a fitting maintenance, suitable to the fortune of the parent, the lord chancellor, on complaint, may make such an order as he shall see proper.

JEW-*bill*, in *Law*, is the famous statute 26 Geo. II. cap. 26. which enabled all *Jews* to prefer bills of naturalization in parliament, without receiving the sacrament, as ordained by stat. 7 Jac. 1. This act was repealed by 27 Geo. II. c. 1.

JEW's *ear*. See AURICULA *Judæ*.

JEW's *frankincense*, in *Botany*. See STORAX-*tree*.

JEW's *mallow*. See MALLOW.

JEW's *stone*, in *Natural History*. See *Lapis* JUDAICUS.

JEWISH *economy*. See OECONOMY.

JEWISH *hours*. See HOUR, &c.

JEZIDES, or JEZIDEANS, a term used among the Mahometans, to signify *heretics*.

In which sense *Jezidean* stands opposed to *Mussulman*. Leunclavius tells us, that the name is derived from an emir, called *Jezid*, who killed the two sons of Ali, Hasan and Hussein, two grandsons of Mahomet on their mother's side, and persecuted the posterity of the prophet. The Agarenians, whose emir or prince he was, looked on him as an impious and heretical person, and hence took occasion to call all whom they accounted heretics, *Jezideans*.

Beaufobre conjectures, that the denomination of this sect is derived from the name of Jesus; but it seems rather to be borrowed from the Persian *Jezid* or *Jezdan*, signifying the good God, in opposition to Arimanius, the evil principle; so that the term points out this sect as the worshippers of the good or true God. After all, this name may have been derived from the city *Jezd*.

Some authors mention the *Jezidees* as a particular people, speaking a language different both from the Turkish and Persian, though somewhat akin to the last. They further tell us, that there are two kinds of *Jezidees*; the one *black*, the other *white*. The white have no tin in the bottom of their hair, but barely an open for the head to pass through; a thing that they observe with a great deal of strictness, in memory of a circle of gold and light which they say fell from heaven upon the neck of their grand schick, or chief of their sect. The black *Jezidees* are paupers, or religious, and go arrayed in sable garments.

The Turks and *Jezidees* bear a strong aversion to each other; and the greatest affront one can put upon a Turk is to call him a *Jezidean*. On the contrary, the *Jezidees* love the Christians; being persuaded that *Jesus*, their chief, is Jesus Christ; or, rather, because some ancient tradition

traditions mention, that *Jenid* made an alliance with the Christians against the Muſſulmen.

They drink wine, even to excess, when they can get it, and eat ſwine's fleſh. They never undergo circumciſion, excepting when they are forced to it by the Turks. Their ignorance is ſurpriſing; they have no books. Indeed they pretend to believe in the Goſpel, and in the ſacred books of the Jews; but they never read either one or other of them. They make vows, and go on pilgrimage; but have no moſques, temples, nor oratories, no feaſts, nor ceremonies; all their religious worſhip conſiſting in ſinging hymns to Jeſus Chriſt, the Virgin, Moſes, and Mahomet. When they pray, they look towards the eaſt, in imitation of the Chriſtians; whereas the Muſſulmen turn towards the ſouth. They believe the devil may poſſibly, one day, come into favour again with God; and that he is the executor of God's juſtice in the other world; for which reaſon, they make it a point of prudence not to ſpeak ill of him, leſt he ſhould revenge himſelf of them.

The black *Jenides* are reputed ſaints; and it is forbidden to weep at their death; inſtead whereof they make exceſſive mirth: and yet, for the generality, they are no more than ſhepherds. They are not allowed to kill the animals they eat; that office belongs to the white *Jenides*. The *Jenides* go in companies like the Arabs; and are an unſettled, wandering tribe, who frequent the Gordian mountains, and the deſerts of Curdiſtan, a province of Perſia. They often change their habitations, and live in black tents made of goats hair, and encompaſſed with large ruſhes and thorns interwoven. They diſpoſe their tents in a circle, placing their flocks in the middle. They buy their wives; the ſtated price whereof is two hundred crowns, be they better or worſe. They are allowed divorce, provided it be to become ſaquirs. It is a crime among them to ſhave their beard, though ever ſo little. They have ſome cuſtoms which intimate that they ſprang originally out of ſome ſect of Chriſtians; for inſtance, in their feaſts one of them preſents a cup full of wine to another, bidding him take the cup of the blood of Jeſus Chriſt; which laſt kiſſes the hand of him who preſents it, and drinks.

IGASUR, in the *Materia Medica*, a name given by ſome authors to the *faba ſanctæ Ignatii*, or Saint Ignatius's bean.

IGNATIUS'S *bean, faba ſancti Ignatii*, in the *Materia Medica*, the fruit of a plant growing in the Eaſt Indies and Philippine iſlands, deſcribed by Father Camilli, in the Philoſophical Tranſactions, under the name of *nux-lempay*, and *cantara*; and by Pluknet, under that of *caerhitiſera malabarbis ſolis ſcandens, cujus nuclei faba ſancti Ignatii nuncupati*. The Spaniards call it *matalirpa*. It is a dry and hard fruit, or kernel of a fruit, of the ſize of a large hazel nut; and is much celebrated for its medicinal virtues, being recommended in vertigoes, lethargies, epileſies, aſthmas, quartan agues, and worms. It is alſo given againſt diſtemperatures of the ſtomach, and as an alexipharmic. The doſe in ſubſtance as an emetic, is ten or twelve grains; and in ſmaller doſes it ſometimes promotes a plentiful ſweat: Neumann ſays that he has known intermittent fevers cured, by drinking on the approach of a paroxyſm, an infuſion of ſome grains of the fruit in cardiuus water; and Dr. Lewis has been informed, that two grains were found to have as much effect as a full doſe of bark. But it ſeems too hazardous for general uſe. See NUX *vomica*.

IGNAVUS, *in Natural Hiſtory*, a name given to the animal called in Engliſh the SLOATH.

IGNIARIUS *lapis*, in *Natural Hiſtory*, a name given by ſome to the PYRITES, or fire-ſtone, from its yielding a great quantity of ſtarks, when ſtruck againſt ſteel.

IGNICOLÆ, *worſhippers of fire*. See GABERS.

IGNIS *aqua, ſee* WATER, a name by which Helmont, in ſome of his writings, calls the ALKAHEST, or univerſal diſſolvent, ſo much talked of by him and Paracelſus.

IGNIS *Fatuus*, a common meteor, chiefly ſeen in dark nights frequenting meadows, marſhes, and other moiſt places, and often ſeen in burying-grounds, and near dunghills. It is known among the people by the appellations, *Will with a wiſp*, and *Jack with a lantern*.

Sir Iſaac Newton calls it a vapour ſhining without heat; and it has been ſuppoſed to be of the ſame nature with the light ſhining from putrefcent ſubſtances. Willoughby and Ray were of opinion that it is occaſioned by ſhining inſects; but all the appearances of it obſerved by Dr. Thoſom, Beccaria, and others, ſufficiently evince, that it muſt be an ignited vapour. The form and ſize of the *ignes fatui* are very various and often variable. The late experiments on air ſerve to furniſh a rational explication of this phenomenon, to which the ignorant and ſuperſtitious have attributed ſo many alarming purpoſes. *Inflammable* AIR has been found to be the moſt common of all the ſubſtances airs in nature; and to be the uſual product of the putrefaction and decompoſition of vegetable ſubſtances in water: and Signior Volta, in a letter to Dr. Prieſtley, informs him, that he fires inflammable air by the electric ſpark, even when the electricity is very moderate: and he ſuppoſes, that this experiment explains the inflammation of the *ignes fatui*, provided they conſiſt of inflammable air iſſuing from marſhy ground by the help of the electricity of fogs, and by falling ſtars, which are very probably thought to have an electrical origin. Prieſtley's Obſ. on Air, vol. iii. Appendix, p. 382. The reader will find a particular account of various particulars relating to the *ignis fatuus* in the Phil. Tranſ. Abr. vol. vii. p. 147, &c.

Dr. Shaw deſcribes an *ignis fatuus*, which he ſaw in the Holy Land, that was ſometimes globular, or in the form of the flame of a candle; and immediately afterwards ſpread itſelf ſo much as to involve the whole company in a pale inoffenſive light, and then contract itſelf again, and ſuddenly diſappear. But in leſs than a minute it would become viſible as before; or, running along from one place to another, with a ſwift progreſſive motion, would expand itſelf, at certain intervals, over more than two or three acres of the adjacent mountains. The atmoſphere at this time had been thick and hazy, and the dew on their bridles was unuſually clammy and unctuous.

In the ſame weather, he obſerved thoſe luminous appearances, which, at ſea, ſkip about the maſts and yards of ſhips, and which the ſailors call *corpuſante* by a corruption of the Spaniſh *cuerpo ſanto*. Shaw's Travels, p. 363.

IGNIS *gehennæ*, in *Chemiſtry*, a name given by Paracelſus to a certain menſtruum, capable of diſſolving all bodies, and remaining itſelf unaltered by them.

Van Helmont ſeems to make this the ſame with the ALKAHEST, ſo celebrated in his writings, and ſo ardently ſought after by all the chemiſts ſince his time.

IGNIS *judicii*. See JUDICIUM *Dei*, and ORDEAL.

IGNIS*PICIUM*, among the *Romans*, a ſpecies of divination taken from the fire uſed in ſacrifices. See PYROMANCY.

IGNITION, in *Chemiſtry*, the application of fire to metals, till ſuch time as they become red-hot, without melting. This happens in gold and ſilver; but eſpecially in iron: but lead and tin are too ſoft and fuſible to bear *ignition*.

IGNORAMUS, q. d. *We do not know*; in *Law*, a word uſed by the grand jury, impannelled on the inquiſition of cauſes criminal, and written upon the bill, when they diſlike their evidence, as defective, or too weak to make good the preſentment.

The effect of which is, that all further enquiry upon that party for that fault is thereby ſtopped, and he is delivered without further anſwer. See BILLA *vera*.

IGNORANCE, the privation, or want, of knowledge.

Ignorance, according to Mr. Locke, is chiefly owing to three cauſes: want of ideas; want of a diſcoverable connection between the ideas we have; and want of tracing and examining our ideas. See IDEA.

Theſe are ſome things we are *ignorant* of for want of ideas: all the ſimple ideas we have are confined to the obſervation of our ſenſes, and the operations of our own minds, which we are conſcious of in ourſelves. What other ideas it is poſſible other creatures may have, by the aſſiſtance of other ſenſes or faculties, remote or perfecter than we have, or different from *ours*, is not for us to determine: but to ſay there are no ſuch, becauſe we conceive nothing of them, is no better an argument, than if a blind man ſhould be poſitive there was no ſuch thing as light and colours, becauſe he had no manner of idea of any ſuch thing.—What faculties, therefore, other ſpecies of creatures have, to penetrate into the nature and inmoſt conſtitutions of things, we know not: this we know, and certainly find, that we want other views of them, beſides thoſe we have, to make diſcoveries of them more perfect. The intellectual and ſenſible world are in this perfectly alike; that the parts which we ſee of either of them, hold no proportion with that we ſee not; and whatſoever we can reach with our eyes, or our thoughts, of either of them, is but a point, almoſt nothing, in compariſon of the reſt. Again, the want of ideas, which we yet ſeem capable of, is another great obſtacle in our way, and keeps us in *ignorance* of things, which we conceive capable of being known. Bulk, figure, and motion, we have ideas of; yet, not knowing what is the particular bulk, motion, and figure, of the greateſt part of the bodies of the univerſe, we are *ignorant* of the ſeveral powers, efficacies, and ways of operation, whereby the effects we daily ſee are produced. Theſe are hid from us in ſome things, by being too remote; and in others by being too minute.

This, at firſt ſight, ſhews us how diſproportionate our knowledge is to the whole extent, even of material beings; to which if we add the conſideration of that infinite number of ſpirits that may be, and probably are,

which are yet more remote from our knowledge, and wherein we have no cognizance at all: we shall find this cause of *ignorance* conceals from us, in an impenetrable obscurity, almost the whole intellectual world; a greater, certainly, a more beautiful world, than the material: for, abating some very few ideas of spirits, which we get from our own mind by reflection, and from thence the best we can collect of the Father of all spirits, the author of them, and us, and all things; we have no certain information to much as of the existence of other spirits, but by revelation: much less have we distinct ideas of their different natures, states, powers, and several conditions, wherein they agree or differ one from another, and from us: and therefore, in what concerns their different species and properties, we are under an absolute *ignorance*.

Another cause of *ignorance* is, the want of discoverable connexion between those ideas we have: where we want that, we are utterly incapable of universal and certain knowledge; and are, as in the former case, left only to observation and experiment. Thus the mechanical affections of bodies having no affinity at all with the ideas they produce in us, we can have no distinct knowledge of such operations beyond our experience; and can reason no otherwise about them, than as the effects of appointments of an infinitely wise agent, which perfectly surpass our comprehension. The operations of our minds upon our bodies is no unconceivable: how any thought should produce a motion in body, is as remote from the nature of our ideas, as how any body should produce any thought in the mind. That it is so, if experience did not convince us, the consideration of the things themselves would never be able, in the least, to discover to us. In some of our ideas there are certain relations, habitudes, and connexions, so visibly included in the nature of the ideas themselves, that we cannot conceive them separable from them by any power whatsoever: in these only we are capable of certain and universal knowledge. Thus the idea of a right-lined triangle necessarily carries with it an equality of its angles to two right ones; but the coherence and continuity of the parts of matter, the production of sensation in us, of colours and sounds, &c. by impulse and motion, being such wherein we can discover no natural connexion with any ideas we have, we cannot but ascribe them to the arbitrary will and good pleasure of the wise architect. The things that we observe constantly to proceed regularly, we may conclude do act by a law set them; though by a law we know not, whereby though causes work steadily, and effects constantly flow from them, yet their connections and dependencies being not discoverable in our ideas, we can have but an experimental knowledge of them. Several effects come every day within the notice of our senses, of which we have so far sensitive knowledge; but the causes, manner, and certainty of their production, we must, for the foregoing reasons, be content to be *ignorant* of. In these we can go no farther than particular experience informs us of matter of fact; and, by analogy, we guess what effects the like bodies are, upon other trials, likely to produce. But as to perfect science of natural bodies (not to mention spiritual beings), we are so far from being capable of any such thing, that it may be reckoned lost labour to seek after it.

The third cause of *ignorance* is, our want of tracing those ideas we have, or may have; and finding out those intermediate ideas, which may shew us what habitude or agreement or disagreement they may have one with another: and thus many are ignorant of mathematical truths for want of application in inquiring, examining, and by due ways comparing, those ideas.

IGNORANCE, in *Law*, is a want of knowledge of the laws; which will not excuse a person from suffering the penalty annexed to the breach of them; because every one is obliged, at his peril, to know the laws of the land.

IGUANA, in *Zoology*, the name of a species of lizard, very frequent in the West-Indies. It is an amphibious animal, of the lizard-shape, and in colour partly brown and partly grey, in some of the animals; and in others of a beautiful green, variegated with black and white spots. From its neck to the extremity of its tail, it has a continued series of flat-pointed and serrated scales, of a fine green colour. These are largest at the neck.

JIB, in *a Ship*, is the fore-most sail of it, being a large flay-sail extended from the outer end of the bowsprit, prolonged by the *jib*-boom, towards the fore-top-mast-head.

JIB-*Boom* is a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the *jib*, and the stay of the fore-top-gallant-mast. It is attached to the bow-sprit by means of two large boom-irons, or by one boom-iron, a cap on the outer end of the bowsprit; or by the cap without, and a strong lashing within.

JIBING. See GYBING.

JIG, in *Music*, &c. See GIGG.

JIGGER, in *Sea Language*, is a machine consisting of a piece of rope about five feet long, with a block at one end, and a heave at the other; and used to hold on the cable, when it is heaved into the ship by the revolution of the windlass. See HOLDING on.

JIGGER-*tackle* is a light small tackle, consisting of a double and single block, used on various occasions by seamen.

JIVA, in *Zoology*, the name of an American animal of the otter-kind, called also *carigueibeia*. It is an herbivorous creature, of the size of a middle-sized cat. Its head is round, and like a cat's; but its nose is sharp-pointed; its eyes are black; its ears rough, and placed very low as in the otter; and it has a few coarse whiskers composed of a few stiff hairs; the feet have all five toes, the inner one being smaller than any of the others; the hair is soft, not long, and all black, except those on the head, which are brown, and some which compose a yellowish spot under the throat. Its note is much like that of a young puppy. It feeds on fish, and other animals. Ray.

IKENILD *Street*, one of the four famous ways, that the Romans made in England. See WATLING-STREET.

ILATHERA *Herb*, in *Botany*. See CLUTIA.

ILEX, in *Botany*. See HOLLY.

ILIAC *passion*, a violent and dangerous kind of COLIC; called also *volvulus*, *miserere mei*, and *theridaphi*.

It takes its name from the intestine *ileon*, on account of its being usually affected in this disease; or, perhaps, from the Greek verb εἰλεῖν, to *wind*, or *twist*; whence also it is the Latins call it *volvulus*.

This disorder is a violent pain in the small intestines, in which the peristaltic motion of the bowels is inverted, and all their contents are thrown up by vomit.

Medical writers distinguish this into three kinds: 1. The convolutionary. 2. The herniofe. And, 3dly, the obstructionary.

In the convolutionary kind, the situation of the intestines in regard to one another is altered, and very frequently has a remarkable displacature. In the herniofe kind, the intestines, distended with feces and with flatulencies, are received into the scrotum, or some other part, so as not easily to be reduced into their natural places. And in the obstructionary, there is no other cause but a violent costiveness.

The *miserere* differs from the ordinary kinds of colic, in degree, as all the symptoms are much more violent in this, cafe; and in its situation, as the ileon and small guts are affected in this, and in the other colics usually the larger; and it is always a much more dangerous cafe than an ordinary colic.

Signs of it. These are extremely sharp and violent pains across the navel, a remarkable anxiety of mind, with frequent eructations and heartburn, and great internal heat; a violent obstruction in the bowels, in which clysters have very little or no effect: and as the disease increases, a vomiting, which, as it continues, at length brings up the feces by the mouth, with violent pains, and frequent faintings; after this, unless the medicines take place, there comes on an inflammation of the ileon, and thence a suppuration and mortification, on which the pains instantly go off, and the patient falls into cold sweats, and dies in a very little time after. It is a very rare cafe, and though many colics are called by this name, yet in reality it is rarely met with. People, however, of all ages and sexes, are equally subject to it from the following causes.

Causes of it. These are either a convolution of the intestines, with an immediate inflammation, or a tumor in the parts of the intestine contained in the herniofe sack, and the use of violent and powerful astringent medicines bringing on such a costiveness as never happens naturally. Violent commotions of the body in leaping, riding, or running, have been known sometimes to bring on the disease, as also violent sneezing and coughing, and the carrying of too great weights; as also crude foods, and such as have been indurated by smoak, and flatulent and fermenting liquors. Sometimes also it has been evidently owing to worms killed in the bowels, and not voided by stool.

Prognostics in it. This is a very terrible disease, both in regard to the danger that attends it, and to the pain. In cases where its origin is from a distention and convolution of the intestines, there is very little hope of recovery; and when it arises from a hernia, it is very often fatal also, especially when attended with an inflammation and plethora. Its mildest state is when it arises only from indurated stools, and an obstinate costiveness;

costiveness, this is usually cured, if proper assistance be given in time.

Method of cure. When a convulsion of the intestines is the cause, the whole effort is to be used to explicate them; but this is a thing more easily conceived in the mind than effected: to this purpose some recommend the swallowing of a musket bullet, others a globule of antimony, and others a pound of quicksilver, taking before hand a spoonful or two of oil of sweet almonds; and ordering motion by walking or riding afterwards; others advise the introducing the nose of a pair of bellows into the orifice of the rectum, and blowing up into the intestines; but as that gut is usually so contracted in this case, as scarce to admit the pipe of a clyster apparatus, there is no great hope of succeeding in the other attempt; and others finally advise the throwing in the fume of tobacco. Some antient authors have recommended to make an opening into the cavity of the abdomen, in order to discover and disengage the strangulated intestine; and some few histories are recorded which seem to favour this practice. But the difficulty of ascertaining with precision the true cause of the disease renders so hazardous and painful an operation as GASTROTOMY hardly ever advisable. The discussion of the inflammation is scarce less necessary than the other; this is to be done by powders of nitre, cinnabar, and crabs eyes, taken four times a day, and by rubbing the abdomen with camphorated spirit of wine, in which saffron has been infused; bags of carminative ingredients, with camphor, may also be applied to the abdomen with good effect: and, finally, if there be a plethoric habit, bleeding is a very necessary operation.

In cases where this is occasioned by a hernia, the first thing to be done is the reducing the intestine into its proper place. To this purpose the patient must lie upon his back, and emollient and carminative fomentations must be applied to the part, made of decoctions of marshmallows, camomile flowers, and the seeds of anise, fennel, and fenugreek; boiled in milk: and when there is no inflammation, fomentations of this kind may be applied in the manner of cataplasms, by wetting a sponge with them, and applying it to the part. An inflammation is carefully to be guarded against, by nitrous medicines, and by gentle diaphoretics; and as soon as the gut is replaced, clysters must be given to bring on again a laxity of the bowels. See HERNIA *incarcerata*.

When the case only arises from an induration of the faeces, there are first to be given internally nitrous and cinnabarine medicines, to prevent or take off an inflammation, and at the same time clysters are to be given, with the emollient decoctions, and a little nitre and camphor, with some oil; and if it be necessary for a yet farther stimulus, some Venice soap may be added; acrid suppositories are to be introduced into the rectum, and the soap plaister to be applied to the abdomen, or else spirit of wine camphorated is to be rubbed in: bags with carminative ingredients may also be applied warm, and where the state is plethoric, bleeding is necessary.

Bleeding is, indeed, of essential importance; it should be performed as soon as the symptoms of inflammation appear, and be repeated according to the strength of the patient and violence of the disease. A blistering plaister should likewise be applied over the part most affected with pain. Fomentations and clysters must by no means be omitted. The patient's feet and legs should be frequently bathed in warm water, and cloths dipped in it applied to his belly. The clysters may be made of barley water, or thin gruel with salt, and softened with sweet oil or fresh butter; and they may be administered every two or three hours or oftener, if the patient continues costive.

These are the general methods, and usually one or other of them takes effect in the milder cases. But it is to be observed, that honey, though ordered by some, is never to be put into these clysters, for where there is an inflammation, it promotes suppurations. The patient is to be kept quiet and warm during the course of the disease, and the diet is to be very sparing, though the drinking warm liquors, such as clear whey, or barley-water, is to be indulged.

If the disease does not yield to clysters and fomentations, recourse must be had to gently stirring purgatives; which should be joined with opiates. Two ounces of the bitter purging salts may be dissolved in a pint of warm water or thin gruel, and a tea-cup full of it taken every half hour till it operates. At the same time, fifteen, twenty or twenty-five drops of laudanum may be given in a glass of peppermint or simple cinnamon water, to appease the irritation and prevent the vomiting, &c. The patient's drink may be sharpened with cream of tartar, juice of lemon, or vinegar. When no liquid will stay on the stomach, purging pills made of powdered jalap and vitriolated tartar, of each half a dram, one grain of opium, and a sufficient quantity of Castile soap, these may be taken at one dose, and if they do not produce effect in a few hours, the dose may be repeated. If these methods fail to procure a stool, the patient may be immersed in warm water up to the breast, and continue in the water as long as he can bear it without fainting; and if necessary, this bathing should be several times repeated. In desperate cases, recourse is had to quicksilver, which is given to the quantity of several ounces, or even of a pound. Those who would avoid this disease, must take care never to be long without a stool: they should always beware of eating too freely of sour or unripe fruit, or baked meats, or drinking flat windy liquors. The disorder has proceeded sometimes from wet cloaths and wet feet. Junker's Consp. Med. p. 317, &c. Buchan. Dom. Med. p. 317, &c. 1776.

Dr. Hunter takes notice of a disease to which children are more particularly subject, because their mesentery, having scarce any fat upon it, easily slips with the gut; and of this he observes there are two kinds; the first is when a part of the gut is received into the part next above it; the other is when a part of the gut is received into the part of the gut next below it. See an account of a particular case of this disorder in London Med. Obs. vol. iv. art. 17. p. 223.

ILIAC *vessels*, are the arteries and veins. The *iliac* arteries are formed by the bifurcation of the aorta, at the last vertebra of the loins. They descend about three fingers breadth from their origin; and then each *iliac* trunk is divided into two secondary arteries, one external, the other internal. The external artery runs down on the *iliac* muscle to the ligamentum Fallopii, under which it goes out at the abdomen. In this course, it sends off only a few small arteries to the peritonæum and other adjacent parts; but as it passes out of the abdomen it detaches two considerable branches, the one or internal branch called the EPIGASTRIC artery, and the other or external called HYPOGASTRIC. The internal *iliac* or HYPOGASTRIC artery, having run a little more than a finger's breadth inward and backward, bends by small degrees obliquely forward and toward the outside; and afterwards contracting in its dimensions, ends in the UMBILICAL artery.

The *iliac* veins are formed by the bifurcation of the vena cava, about the last vertebra of the loins. Presently after their leaving the vena cava, they each divide into two principal branches; one called *iliaca externa* or *anterior*, or simply *iliaca*; the other *interna* or *posterior*, called also *hypogastrica*. The external vein seems to be the continuation of the trunk, and the *hypogastrica* only a branch. They pursue the same course as the arteries of the same name. Winslow.

ILIACUS *externus*, a muscle of the thigh. See PYRIFORMIS.

ILIACUS *internus*, a muscle of the thigh, which arises fleshy from the internal concave part of the os ilium; and, in its descent over the inferior part of it, joins with the psoas magnus, and is inserted with it under the termination of the pectineus.

This, with the psoas magnus, moves the thigh forward in walking.

ILIAD, Ilias, the name of an ancient epic poem, the first, and finest, of those composed by Homer.

The word is derived from the Greek Ἰλιάς, of Ἴλιος, *Ilium*, Troy, a famous city of Asia, which the Greeks besieged for the space of ten years, and at last destroyed, on account of the rape of Helena, which makes the subject of the work.

The poet's design in the *Iliad* was, to shew the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among them. In order to which, he sets before their eyes the calamities that befel their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. See FABLE.

The *Iliad* is divided into twenty-four books, which are marked with the letters of the alphabet.—Pliny gives us an account of an *Iliad* written on so very slender a paper, that the whole might be contained in a nut-shell.

For the conduct of the *Iliad*, see father Bossu, Madam Dacier, and M. De la Motte.

The critics maintain the *Iliad* to be the first, and yet the best, poem that ever appeared in the world: Aristotle's *Poetics* are almost taken wholly from it; the philosopher had nothing to do, but to form precepts from the poet's practice.—Some authors tells us, that Homer invented not only poetry, but all other arts and sciences; and that there are the visible marks of a perfect knowledge in every one of them, to be seen in the *Iliad*.

The ingenious Mr. Barnes, of Cambridge, has very strenuously

nuously attempted to prove Solomon to have been the author of the *Iliad*.

The English translation of the *Iliad* by Mr. Pope, is well known.

ILISSIDES, in *Mythology*, a surname of the Muses, from the river *Ilissus* in Attica, the waters of which were reckoned sacred.

ILITHYA, derived from *eneleo, to bring forth*, in *Mythology*, the daughter of Juno, and sister of Hebe, who presided over deliveries. This goddess had a temple at Rome, in which were registered the birth and death of every citizen: a custom established by Servius Tullius.

ILIVILIHU, in *Natural History*, a name given by the inhabitants of the Philippine islands to a very remarkable species of bird, common in that country. It is called by some writers *cercicis parvulo monstro*, the small mountain quail, and it is indeed a quail in all the characters; but it is very beautifully variegated in its colours, and is smaller than a sparrow. It lives in hilly places, and is a very well tasted bird. See QUAIL.

ILIUM *intestinum*. See INTESTINE.

ILIUM *os*. This bone was so called by the ancients, because it supports the parts they called the *ilia*. It is the largest of the three bones of the pelvis. It is flat, very broad, unequally convex, and concave; partly round, and partly of an irregular square figure. It is divided commodiously enough into the crista, basis, anterior and posterior edge; and two sides, one external, the other internal. The crista is the upper part, and is a pretty thick arched border, the circumference of it is little more than a quadrant of a circle; the anterior and middle part is convex outward, the posterior part a little convex inward. Anatomists, for the sake of regularity in their descriptions, distinguish it in two labia and a middle space or interstice between them. It is originally an epiphysis, of which we sometimes see plain marks in a very advanced age. The posterior portion of the crista, which is convex inward, is much thicker than the anterior; and, for that reason, may be called the tuberculum of the crista. The whole crista appears to be covered over with a cartilage; but this in reality is no more than the dried tendinous expansion of the muscles. The anterior edge of this bone has two eminences or tubercles, called the anterior spines, one superior, the other inferior; and likewise two notches, one between the spines, the other below the inferior spine. The posterior edge is shorter and thicker than the anterior; it terminates likewise in two eminences or spines, between which there is a considerable notch. The basis or inferior part of the bone, is the thickest and narrowest of all; it forms anteriorly a portion of the acetabulum, and posteriorly almost all the ischiatic sinus. The outside is convex on the fore-part, and concave on the back-part: we observe on it the remains of a long semicircular line, which reaches from the upper anterior spine to the great ischiatic sinus, being a muscular mark; and above, and behind this impression, there are several other muscular marks. A little above the edge of the acetabulum, we see likewise many inequalities, which surround part of the edge in a semicircular form, being a collection of muscular and ligamentary marks. The inside of this bone is unequally concave, and has several inequalities round the back part. The chief of these is that large cartilaginous surface of the figure of a great S, or a bird's head; which answers to the lateral surface of the os sacrum, with which it is connected by a cartilaginous symphysis. The other inequalities are much of the same kind with those of the lateral part of the os sacrum, with which they form several rough and irregular cavities. From the upper part of the cartilaginous surface or symphysis, all the way to the oblique eminence, runs a prominent line, which bounds the concavity of the inside of this bone, and distinguishes the margin of the pelvis from the bottom. Winslow. See Os and *Os* INNOMINATUM.

ILLECEBRUBI, *Mountain knee-grass*. See WHITLOW-*grass*.

ILLEGITIMATE *birth*, or *delivery*. See DELIVERY, and ABORTION.

ILLEVIABLE, in *Law*, a debt or duty which cannot, or ought not, to be levied.

The word *wilful* is usually set on a debt, or due, that is *illeviable*.

ILLICIUM, *showy aromatical tree*, in *Botany*, a genus of the *dodecandria stigynia* class: the characters of which are that the calyx is four-leaved and deciduous; the petals are eight; the nectaria are eight and tubulated; the stamina are fifteen, with bifid anthoræ; the fruit is an ovated, compressed, multispermous capsule. This tree is a native of Japan, China, and other parts of the East, as well as of both the Floridas in America. M. Geoffroy says, that it is esteemed in China and all over the East, for curing any bad taste in the mouth, as a preservative against the effects of bad air, and also for the stone and gravel. The Indians make a vinous liquor, by steeping the fruit in water and fermenting the infusion. The Dutch, as well as the natives in the East Indies, mix this fruit with their tea, and therein. The Chinese and Japanese esteem it a sacred tree, and they offer it to their idols, and burn the bark of it, as a perfume, on their altars: and lay the branches on the graves of the dead, as an offering to the ghosts of their pious departed friends. Mr. Ellis concludes, from the distinguishing characters of this genus, that it should be ranked in the *polyandria polygynia* class. Phil. Trans. vol. lx. p. 524.

ILLITERATURE, in *Law*; if an *illiterate* man be to seal a deed, he is not bound to do it, if none be present to read it, if required; and reading a deed false will make it void. 2 Rep. 3. 11. A man may plead *non est factum* to a deed read false; as where a release of an annuity was read to an *illiterate* person, as a release for the arrears only, &c. agreed to be released. Moore, 148. If there is a time limited for a person to seal a writing; in such case *illiterature* shall be no excuse; because he might provide a skilful man to instruct him: but when he is obliged to seal it upon request, &c. there he shall have convenient time to be instructed. 2 Nelson's Abr. 946.

ILLUMINATION, in a *general sense*, denotes the act of a luminous body, or a body that emits light; sometimes, also, the state of an opake body that receives it.

ILLUMINATION, *circle of*. See CIRCLE.

ILLUMINATIVE *lunar month*. See MONTH.

ILLUMINED, ILLUMINATI, a *Church term*, anciently applied to such persons as had received baptism.

This name was occasioned by a ceremony in the baptism of adults; which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, ILLUMINATI, is also the name of a sect of heretics, who sprung up in Spain about the year 1575, and were called by the Spaniards, *Alumbrados*.

Their principal doctrines were, that, by means of a sublime manner of prayer, which they had attained to, they entered into so perfect a state, that they had no occasion for ordinances, sacraments, nor good works; and that they could give way, even to the vilest actions, without sin.

The sect of *Illumined* was revived in France, in the year 1634, and were soon after joined by the Guerinets, or disciples of Peter Guerin, who together made but one body, called also *Illumined*: but they were so hotly pursued by Louis XIII. that they were soon destroyed.

The brothers of the *Rosy Cross* are sometimes also called *Illumined*. See ROSYCRUCIAN.

ILLUSTRIOUS, ILLUSTRIS, was heretofore, in the Roman empire, a title of honour peculiar to people of certain rank. It was first given to the most distinguished among the knights, who had a right to bear the clavus: afterwards, those were intitled *illustrious*, who held the first rank among those called *honorati*; that is the præfecti prætorii, præfecti urbis, treasurers, comites, &c.

There were, however, different degrees among the *illustres*: as in Spain they have grandees of the first and second class, so in Rome they had their *illustres*, whom they called great, *majores*; and others less, called *illustres minores*.—For instance; the præfectus prætorii was a degree below the master of the offices, though they were both *illustres*.

The *Novels* of Valentinian distinguish as far as five kinds of *illustres*; among whom, the *illustres administratores* bear the first rank.

IMAGE, IMAGO, in *Optics*, a natural, lively representation of an object, opposed to a smooth, well-polished surface, or mirror.

The Latin word *imago*, comes originally from the Greek *μιμεῖσθαι, imitari, to imitate*, or *mimic*.

IMAGE, taken more largely, denotes the spectre, or appearance, of an object; whether by reflexion or refraction.

In all plane mirrors, the *image* is of the same magnitude as the object; and appears as far behind the mirror, as the object is before it.

In convex mirrors, the *image* appears less than the object; and farther distant from the centre of the convexity than from the point of reflexion.

Mr. Molyneux gives the following rule for finding the diameter of an *image*, projected in the distinct base of a convex mirror: as the distance of the object from the mirror is to the distance from the *image* to the glass; so is the diameter of the *object*, to the diameter of the *image*. See LENS, MIRROR, REFLECTION, and REFRACTION.

MAGE is alſo uſed for the trace, or mark, which outward objects impreſs on the mind, by means of the organs of ſenſe. See IDEA.

IMAGE alſo ſignifies an artificial repreſentation performed by man; as in painting, ſculpture, and the like.—In which ſenſe the word is now generally uſed in ſpeaking of things holy, or imagined to be ſo.

The noble Romans preſerved the *images* of their anceſtors, with a great deal of care and concern, and had them carried in proceſſion at their funerals and triumphs: theſe were commonly made of wax, or wood; though ſometimes of marble, or braſs. They placed them in the veſtibules of their houſes; and they were to ſtay there, even if the houſe happened to be ſold, it being accounted impious to diſplace them. Appius Claudius was the firſt who brought them into the temples, in the year of Rome 259, and he added inſcriptions to them, ſhewing the origin of the perſons repreſented, and their brave and virtuous atchievements.

It was not, however, allowed for all who had the *images* of their anceſtors in their houſes, to have them carried at their funerals; this was a thing only granted to ſuch as had honourably diſcharged themſelves of their offices: for thoſe who failed in this reſpect, forfeited that privilege; and in caſe they had been guilty of any great crime, their *images* were broken to pieces.

The Jews abſolutely condemn all *images*, and do not ſo much as ſuffer any ſtatues or figures in their houſes, much leſs in their ſynagogues, or places of worſhip.

The uſe and adoration of *images*, are things that have been a long time controverted in the world.

It is plain from the practice of the primitive church, recorded by the earlier fathers, that Chriſtians, for the firſt three centuries after Chriſt, and the greater part of the fourth, neither worſhipped *images* nor uſed them in their worſhip. However, the greater part of the Popiſh divines maintain, that the uſe and worſhip of *images* were as ancient as the Chriſtian religion itſelf: to prove this, they allege a decree, ſaid to have been made in a council held by the Apoſtles at Antioch, commanding the faithful, that they may not err about the object of their worſhip, to make the *images* of Chriſt and worſhip them. Baron. ad ann. 102. But no notice is taken of this decree, till 700 years after the Apoſtolic times, after the diſputes about *images* had commenced. The firſt inſtance that occurs in any credible author of *images* among Chriſtians, is that, recorded by Tertullian de Pudicit. c. 10. of certain cups, or chalices, as Baſſarmine pretends, on which was repreſented the parable of the good ſhepherd carrying the loſt ſheep on his ſhoulders: but this inſtance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or chalices. Another inſtance is taken from Euſebius, Hiſt. Eccl. lib. vii. cap. 18. who ſays, that in his time, there were to be ſeen two braſs ſtatues in the city of Paneas or Cæſarea Philippi; the one of a woman on her knees, with her arms ſtretched out, the other of a man over againſt her, with his hand extended to receive her: theſe ſtatues were ſaid to be the *images* of our Saviour, and the woman whom he cured of an iſſue of blood. From the foot of the ſtatue repreſenting our Saviour, ſays the hiſtorian, ſprung up an exotic plant, which as ſoon as it grew to touch the border of his garment, was ſaid to cure all ſorts of diſtempers. Euſebius, however, vouches none of theſe things; nay, he ſuppoſes that the woman who erected this ſtatue of our Saviour was a pagan, and aſcribes it to a pagan cuſtom. Farther, Philoſtorgius, Eccl. Hiſt. lib. vii. c. 3. expreſsly ſays, that this ſtatue was carefully preſerved by the Chriſtians, but that they paid no kind of worſhip to it, becauſe it is not lawful for Chriſtians to worſhip braſs or any other matter. The primitive Chriſtians abſtained from the worſhip of *images*, not, as the Papiſts pretend, from tenderneſs to heathen idolaters, but becauſe they thought it unlawful in itſelf to make any *images* of the Deity. Juſtin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 46. Aug. de Civit. Dei, lib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symb. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 202. Some of the fathers, as Tertullian, Clemens Alexandrinus, and Origen, were of opinion, that, by the ſecond commandment, the arts of painting and engraving were rendered unlawful to a Chriſtian, ſtyling them evil and wicked arts. Tert. de Idol. cap. 3. Clem. Alex. Admon. ad Gent. p. 41. Orig. contra Celſum lib. vi. p. 282. The uſe of *images* in churches as ornaments, was firſt introduced by ſome Chriſtians in Spain, in the beginning of the fourth century; but the practice was condemned as a dangerous innovation, in a council held at Elibertis in 305. Epiphanius, in a letter preſerved by Jerom, tom. ii. ep. 6. bears ſtrong teſtimony againſt *images*, and may be conſidered as one of the firſt ICONOCLASTS. The cuſtom of admitting pictures of ſaints and martyrs into the churches, for this was the firſt ſource of *image* worſhip, was rare in the latter end of the fourth century; but became common in the fifth: however, they were ſtill conſidered only as ornaments; and even in this view, they met with very conſiderable oppoſition. In the following century the cuſtom of thus adorning churches became almoſt univerſal, both in the Eaſt and Weſt. Petavius expreſſly ſays, (de Incarn. lib. xv. cap. 14.) that no ſtatues were yet allowed in the churches; becauſe they bore too near a reſemblance to the idols of the gentiles. Towards the cloſe of the fourth or beginning of the fifth century, *images*, which were introduced by way of ornament, and then uſed as an aid to devotion, began to be actually worſhipped. However, it continued to be the doctrine of the church, in the ſixth and in the beginning of the ſeventh century, that *images* were to be uſed only as helps to devotion; and not as objects of worſhip. The worſhip of them was condemned in the ſtrongeſt terms by pope Gregory the Great; as appears by two letters of his written in 601. From this time to the beginning of the eighth century, there occurs no ſingle inſtance of any worſhip given or allowed to be given to *images*, by any council or aſſembly of biſhops whatever. But they were commonly worſhipped by the monks and populace in the beginning of the eighth century; inſomuch, that in the year 726, when Leo publiſhed his famous edict, it had already ſpread into all the provinces ſubject to the empire. See the hiſtory of the oppoſition to them under ICONOCLASTS. See Bower's Hiſt. of the Popes, vol. iii. p. 202, &c.

The Lutherans condemn the Calviniſts for breaking the *images* in the churches of the Catholics, looking on it as a kind of ſacrilege; and yet they condemn the Romaniſts (who are profeſſed *image worſhippers*) as idolaters: nor can theſe laſt keep pace with the Greeks, who go far beyond them in this point; which has occaſioned abundance of diſputes among them. See ICONOCLASTS.

The Mahometans have a perfect averſion to *images*; which was what led them to deſtroy moſt of the beautiful monuments of antiquity, both ſacred and profane, at Conſtantinople.

IMAGE, in *Rhetoric*, alſo ſignifies a lively deſcription of any thing in a diſcourſe.

Images in diſcourſe are defined, by Longinus, to be, in general, any thoughts proper to produce expreſſions, and which preſent a kind of picture to the mind.

But, in the more limited ſenſe, he ſays, *images* are ſuch diſcourſes as come from us, when, by a kind of enthuſiaſm, or an extraordinary emotion of the ſoul, we ſeem to ſee the things whereof we ſpeak, and preſent them before the eyes of thoſe who hear us.

Images, in rhetoric, have a very different uſe from what they have among the poets: the end principally propoſed in poetry is, aſtoniſhment and ſurprize; whereas the thing chiefly aimed at in proſe, is to paint things naturally, and to ſhew them clearly. They have this, however, in common, that they both tend to move, each in its kind.

Theſe *images*, or *pictures*, are of vaſt uſe, to give weight, magnificence, and ſtrength, to a diſcourſe. They warm and animate it; and, when managed with art, according to Longinus, ſeem, as it were, to tame and ſubdue the hearer, and put him in the power of the ſpeaker. See HYPOTYPOSIS.

IMAGINARY *root*, in *Algebra*. See ROOT.

IMAGINATION, a power or faculty of the ſoul, whereby it conceives and forms ideas of things, by means of impreſſions made on the fibres of the brain, by ſenſation. This power depends on the memory. Ideas enter into the mind by the ſenſes; the memory retains them; and the *imagination* compounds them. Some writers have diſtinguiſhed two ſorts of *imagination*; the one, which conſiſts in retaining the ſimple impreſſion of objects, is called the paſſive *imagination*; the other arranges the images that are received, and combines them in a thouſand ways, and is called the active *imagination*. The organs of our ſenſes are compoſed of fibrille, or little fibres, which, at one end, terminate in the outward parts of the body and ſkin, and at the other in the middle of the brain. Theſe fibres may be moved two ways: either beginning at that end which terminates in the brain, or at that which terminates without. Now the agitation of theſe fibres cannot be communicated to the brain, but the ſoul will be effected, and perceive ſomething. If then the agitation begins where objects made their firſt impreſſion, viz. on the external ſurface of the fibres of our nerves, and is communicated thence to the brain; the ſoul, in that caſe, judges that what the perceives is without; that is, ſhe perceives an external object as preſent: but if only the anterior fibres be moved by the courſe of the animal ſpirits, or in ſome other manner,

the soul then imagines, and judges, that what she perceives is not without, but within the brain; that is, she perceives an object as absent; and herein lies the difference between sensation and *imagination*.

The faculty of *imagining*, or *imagination*, only consists, according to the doctrine of Malebranche, in the power which the soul has of forming images of objects, by producing a change in the fibres of that part of the brain, which may be called the principal part, because it corresponds to all the parts of our body, and is the place where the soul (if it may be so said) immediately resides. It matters not which that part is, nor whether the opinion of Willis be true, who places the common sense in the two bodies, called *corpora striata*, and the *imagination* in the *corpi calloſum*; or that of Vernelius, who places sensation in the pia mater that encompaſſes the ſubſtance of the brain; or that of Deſcartes, who places it in the pineal gland: it ſuffices that there is ſome ſuch part.

Since then the *imagination* only conſiſts in a power which the ſoul has of forming images of objects, by impreſſing them on the fibres of the brain, it follows that the larger and more diſtinct the veſtigia or tracks of the animal ſpirits, which are the ſlues or ſtrokes, as it were, of thoſe images, are; the more ſtrongly and diſtinctly the ſoul *imagines* thoſe objects.—Now as the breadth, depth, and cleanneſs of the ſtrokes of a ſculpture depend on the force wherewith the graver acts, and the obedience which the copper yields, ſo the depth and cleanneſs of the tracks of the *imagination* depend on the force of the animal ſpirits, and the conſtitution of the fibres of the brain; and it is that variety which is found in thoſe two things, to which we owe almoſt all that vaſt difference which we obſerve in people's minds.—On the one ſide are abundance and ſcarcity, briſkneſs and ſlowneſs, largeneſs and ſmallneſs, of the animal ſpirits; and on the other hand, delicacy or groſſneſs, humidity or dryneſs, ſtiffneſs or flexibility of the fibres of the brain; and laſtly, a particular relation which the animal ſpirits may have with thoſe fibres: from the various combinations of which things, will reſult a ſufficiently *great* variety, to account for all the different characters which appear in the minds of men: and from the ſame principle flows that difference which is obſerved in the ſame perſon's mind, at different times, and under different circumſtances, as in childhood, manhood, and old age, in ſickneſs, health, &c.

It may here be obſerved, that the fibres of the brain are more agitated by the impreſſion of objects, than by the courſe of the animal ſpirits; and for this reaſon the ſoul is more affected with objects, which it perceives by ſenſation, and which it looks on as preſent, and capable of giving it pleaſure or pain, than by thoſe perceived by *imagination*, which it judges to be diſtant.—And yet it ſometimes happens, that in perſons whoſe animal ſpirits are extremely agitated by falling, waking, drinking, a fever, or ſome violent paſſion, theſe ſpirits move the inward fibres of the brain as forcibly as inward objects do; ſo that thoſe perſons perceive things by ſenſation, which they ſhould only perceive by *imagination*; for *imagination* and *ſenſation* only differ from each other, as the greater from the leſs. See Malebranche, Recher. de la Verité, lib. ii. See MADNESS, DELIRIUM, PHRENSY, MELANCHOLY, &c. *Imagination* or fancy, ſays the ingenious Mr. Harris, though as to its origin it may be ſubſequent to ſenſe, yet is truly prior to it in dignity and uſe. It is this which retains the fleeting forms of things, when things themſelves are gone, and all ſenſation is at an end. The difference between ſenſe and *imagination* appears from hence, that we have an *imagination* of things that are gone and extinct, which cannot be made the objects of ſenſation. We have an eaſy command over the objects of our *imagination*; whereas our ſenſations are neceſſary, when their objects are preſent. *Imagination* is alſo diſtinguiſhed from memory; as the former views ſome relict of ſenſation repoſed within us, without thinking of its riſe, or referring it to any ſenſible object, whereas memory views ſuch relict, referring it at the ſame time to that ſenſible object, which in time paſt was its cauſe and original, and recollection is the road which leads to memory, through a ſeries of ideas, however connected, whether raſionally or caſually. Beſides, *imagination* may exhibit, after a manner, things that are to come: but memory is confined in the ſtricteſt manner to the paſt. Hermes, p. 354, &c. ed. 2d.

The hiſtories of monſtrous births, where the imperfection or deformity is aſcribed to the *imagination* of the mother, are numberleſs; and indeed ſo well authenticated, that an advocate for the power of *imagination* in pregnant women, will triumphantly exclaim, that facts are ſtubborn things; and that all reaſoning is ſophiſtry, when oppoſed to *them*. But the anſwer to this kind of argument is, that experience ſhews it to be difficult to aſcertain a fact; and that when we coolly and carefully examine the truth of reputed facts, they are often diſcovered to have been advanced through haſtineſs and credulity, and to have been perpetuated through ignorance and ſervility.

The productions of nature, in the ſeveral claſſes both of living and inanimate things, are not all equally perfect: we ſee in birds, beaſts and plants, every now and then, an irregular or preternatural formation; but where the accident happens in the human ſpecies, an opinion has been adopted, that a fright, or ſome other affection of the mother, in the courſe of her pregnancy, has wrought the change. The advocates for this opinion, if they mean any thing, muſt mean, that at the inſtant the mother received the impreſſion, the child was of the natural form, but that by the power of her *imagination* the ſtructure of the parts was that moment altered, and aſſumed the appearance, either gradually or ſuddenly, with which the child was born. They muſt conceive that the infant who is born with a large diſcolouration on any part of its ſkin, had, before the diſcolouration took place, a fair ſkin: that the child who is born with ſix toes, had originally but five: and again, that the child who is born with one leg or one arm, had originally two, and ſo of every other preternatural appearance, whether it be an increaſe or decreaſe of the parts of the body.

By expoſing the abſurdity of one example, it will appear that all the other wonderful ſtories of the ſame kind are equally abſurd. It has been alledged, for inſtance, that a lady advanced five or ſix months in her pregnancy, has been ſo terrified by a beggar thruſting the ſtumps of an amputated arm into the coach, that the child of which ſhe was afterwards delivered, was born with a ſtump of arm reſembling that of the beggar. Here let us paſule a while, and conſider what an operation muſt be performed to work this effect. A child at the term of five or ſix months, is of conſiderable bulk, and the arm itſelf not ſmall. This arm muſt drop off by the power of *imagination*: there muſt be no blood loſt to endanger the life of the child; and the wound muſt be healed before the birth. The mere ſtating of this poſition expoſes its ridiculouſneſs.

But admitting that a limb could drop off by the force of fancy, it muſt ſtill remain with the mother until the delivery; and the bones at leaſt would not putrify and waſte away, though the fleſh would. But it never was pretended that in caſes of this nature, any part of the deficient limb was found by the midwife; and what is worth obſerving, that the ſtumps of all ſuch imperfect limbs, have a ſmooth ſkin, which plainly indicates they were from their firſt formation of the ſame figure: for had there been a wound, there would have been a ſcar, and ſcars are very diſtinguiſhable from ſound ſkin.

There is no defect more frequent than that of the hare lip, and it ſeldom happens that a woman who has a child with that deformity, does not endeavour to excuſe it, as either longed for a hare, or was frightened with a hare, or ſaw ſomebody with a hare lip; it is no matter which. A woman already prepoſſeſſed that there muſt have been ſome ſuch cauſe, is not long at a loſs: her memory, or her prejudice, ſoon furniſhes her with a fact, and the inſtance of this child is added to the long catalogue of ſuch.

It is not more than a century ſince ſome men of learning gave credit to the efficacy of ſympathetic medicines, which, like other charms, were to communicate their virtues to patients at a diſtance. Learning and good ſenſe have at length baniſhed this viſionary conceit; and in a century more, the notion of the *imagination* of the mother operating on the body of her unborn child, will meet with the ſame contempt. After all, the whole of this ſubject is not yet ſufficiently explained. See FOR-

IMAGINIFER, among the *Romans*, an enſign-bearer, who carried the ſtandard on which was repreſented the image of the reigning emperor. See SIGNA.

IMAGO, in *Natural Hiſtory*, is a name given by Linnæus to the third ſtate of inſects, when they appear in their proper ſhape and colours, and under no more than one formation.

IMAM, or IMAN, a miniſter, in the Mahometan church, anſwering to a pariſh prieſt among us.

The word properly ſignifies what we call a prelate, *antiſtes*, one who preſides over others; but the Muſſulmen frequently apply it to a perſon who has the care and inſpection of a moſque, who is always there at firſt, and reads prayers to the people, which they repeat after him.

IMAM is alſo applied, by way of excellence, to the four chiefs or founders of the four principal ſects in the Mahometan religion.

Thus Ali is the *imam* of the Perſian, or of the ſect of the Schiaites; Abu-beker the *imam* of the Sunnites, which is the ſect followed by the Turks; Saphii, or Safi-y, the *imam* of another ſect, &c.

The Mahometans do not agree among themſelves about this *imamate* or dignity of the *imam*. Some think it of divine

divine right, and attached to a ſingle family, as the pontificate of Aaron.—Others hold, that it is, indeed, of divine right, but deny it to be ſo attached to any ſingle family, as that it may not be transferred to another. They add, that the *imam* is to be clear of all groſs ſins; and that otherwiſe he may be depoſed, and his dignity may be conferred on another. However this be, it is certain, that after an *imam* has once been owned as ſuch, by the Muſſulmen, he who denies that his authority comes immediately from God, is accounted impious; he who does not obey him, is a rebel; and he who pretends to contradict what he ſays, is eſteemed a fool, among the orthodox of that religion. The *imams* have no outward mark of diſtinction; their habit is the ſame with that of the Turks in common, except that the turban is a little larger, and folded ſomewhat differently.

IMAMIA, a name given to that ſect of the Mahometans, to which the Perſians adhere. See IMAM.

IMBANKING, ſee BANKING.

IMBARGO, or EMBARGO, a ſtop or ſtay put upon ſhips, or merchandize, uſually by public authority. See EMBARGO.

IMBATTLED, ſee EMBATTLED.

IMBECILITY, a ſtate of languor or decay; wherein the body is not able to perform its uſual exerciſes or functions.

IMBER, in *Ornithology*, ſee EMBER *Goſe*, and FLUDER.

IMBEZLE, or IMBEZZLE, is probably from the old Engliſh word to waſte, pilfer, or purloin.

As where a perſon intruſted with goods, waſtes, conſumes, and diminiſhes them, he is ſaid to *imbezzle* them.

Perſons that *imbezzle*, or illegally diſpoſe of any woollen, linen, fuſtian, cotton, or iron materials; or gloves, leather, ſhoes, &c. with which they are intruſted for manufacture, ſhall forfeit double the value, or be ſent to the houſe of correction, and there whipped, and kept to hard labour fourteen days: and for the ſecond offence, forfeit four times the value, &c. Buyers and receivers are liable to the ſame penalties. 13 Geo. II. c. 8.

If any ſervant *imbezzles*, purloins, or makes away his maſter's goods, to 40 ſhillings value, it is made felony without benefit of clergy, 12 Ann. c. 7. *Imbezzling* the king's armour, or ſtores, is felony, by 31 Eliz. c. 4. other inferior imbezzlements and miſdemeanours of the ſame kind are puniſhed with fine and impriſonment, by 1 Geo. I. c. 25. The uſual method of proceeding againſt high officers who *imbezzle* the public money is by impeachment in parliament. At common law the offender is ſubject to a diſcretionary fine and impriſonment. *Imbezzling*, or vacating records, is a felonious offence againſt public juſtice, 8 Hen. VI. c. 12.

IMBIBE, is commonly uſed in the ſame ſenſe as *abſorb*, viz. where a dry porous body takes up another that is moiſt.

IMBLOCATION, in *Middle Age Writers*, a particular method of diſpoſing of the dead bodies of excommunicated perſons, by raiſing over them a heap of ſtones, or earth.

This was done in the fields, or near high-ways; it being unlawful to bury them in holy ground, or even to inter them at all. See BURIAL.

The word is derived from *blm*, tumulus.

IMBRICATED, is uſed by ſome botaniſts, to expreſs the figure of the leaves of ſome plants, which are hollowed like an *imbrex*, or gutter-tile, or are laid in cloſe ſeries over one another like the tiles of a houſe.

IMBRICATED *cup*, *imbricatus calyx*, in *Botany*, a term uſed by authors to expreſs the cups of ſome of the plants which have compound flowers; in which the common perianthium, ſurrounding the whole cluſter of flowers, is compoſed of ſeveral ſeries of ſquamæ, the exterior of which is ſhort, and the interior longer, but in great part hid under theſe upper ones.

IMBRICATED *ſhell*, *imbricata concha*, in *Natural Hiſtory*, a term uſed in general to expreſs any ſpecies of ſhell-fiſh, whoſe ſhells are elevated into tranſverſe ridges, lying over one another at the baſe, in the manner of the tiles on a houſe-top. It has alſo been uſed as the name of a peculiar ſpecies of ſhell: this is a *cordiformis* or heart-ſhell, whoſe ſides are remarkably ridged in this tranſverſe manner, and at the ſame time ſo divided longitudinally by ſeven high ribs running from the apex to the edge, that the whole repreſents the roof of a houſe with the beams and raſters, before they are covered by the tiling. Hence the French call it *foſſiere*.

IMITATION, in *Muſic*, a kind of compoſition wherein one part is made to imitate another, either throughout the whole piece, which is one of the kinds of canon, or only during ſome meaſures, which is a *ſingle imitation*.

Sometimes the movement, or the figure of the notes, alone, is *imitated*; and that, ſometimes, even by a contrary motion, which makes what they call a *retrograde imitation*.

Imitation differs from *fugue*, becauſe in the former the repetition muſt be a ſecond, a third, a fifth, ſeventh, or ninth, either above or below the firſt voice; whereas if the repetition were in uniſon, a fourth, fifth, or eighth, higher or lower, it would be a *fugue*.

IMITATION, in *Oratory*, is an endeavour to reſemble a ſpeaker or writer in thoſe qualities, with regard to which we propoſe them to ourſelves as patterns. The firſt hiſtorians among the Romans, ſays Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how cloſely Virgil has imitated Homer in his Æneid, Heſiod in his Georgics, and Theocritus in his Eclogues. Terence copied after Menander; and Plautus after Epicarmus, as we learn from Horace, lib. ii. ep. ad Auguſt. who himſelf owes many of his beauties to the Greek lyric poets. Cicero appears, from many paſſages in his writings, to have imitated the Greek orators. Thus Quintilian ſays of him, that he has expreſſed the ſtrength and ſublimity of Demoſthenes, the copiouſneſs of Plato, and the delicacy of Iſocrates. Inſt. Or. lib. x. cap. 1.

Writers on rhetoric have propoſed three enquiries under the head of *imitation*, viz. Who are to be imitated? What we are to imitate? and In what manner? With reſpect to the firſt, we ſhall only obſerve, that in common caſes it is not always what is abſolutely beſt, but comparatively ſo in its own kind, and beſt ſuits their own taſte, that ſhould determine perſons in the choice of their patterns for *imitation*: however, only the beſt writers, and thoſe whom we may moſt ſafely truſt, ſays Quintilian, are to be read long. With reſpect to the ſecond enquiry, the things to be imitated are the perfections of the beſt maſters in their ſeveral kinds; and theſe are different, according to the various ſubjects in which they excel. As to the manner of *imitation*, it ought to be conſidered, that he who only copies or tranſlates from another, and endeavours to paſs it off for his own, is not an *imitator*, but a plagiary. The true art of *imitation* conſiſts in ſo diverſifying what we take from others, as if we can, to improve it, or at leaſt not ſuffer it to receive any detriment by our alteration. And this may be done, by ſo enlarging a thought, or expreſſion taken from another, as in a good meaſure to render it our own: by either abridging, or only taking a part of what another has ſaid before us; by keeping the thought, and applying it to a different ſubject; and finally, by preſerving the thought, and applying them to the ſame ſubject, but changing their order, and repreſenting them in a different circle.

See Ward's Orat. vol. ii. ſect. 53 and 54.

IMMACULATE, *without ſtain*.—A term much uſed among the Romaniſts; when ſpeaking of the conception of the bleſſed Virgin, they call it *immaculate*.

When the cap is given to a doctor of the Sorbonne, he is obliged to ſwear, that he will defend the *immaculate* conception. This was decreed by an act of the Sorbonne in the fourteenth century; in imitation of which, eighty other univerſities made the ſame order.

The military orders in Spain are all ſolemnly obliged to defend this prerogative of the Virgin. See CONCEPTION.

There is alſo a Congregation of the IMMACULATE *Conception*; in moſt numeries whereof is a ſociety of ſecular maids, whoſe end is to honour the *immaculate conception*: of which they make a public profeſſation every year, and a private one every day. See THEATINES.

IMMANENT, in *Logic*.—The ſchoolmen diſtinguiſh two kinds of ACTIONS; the one *tranſient*, which paſs from the agent to the patient; the other *immanent*, which continue in the agent.

IMMATERIALITY, abſtraction from matter; or what we underſtand by pure ſpirit.

Plato proves the *immateriality* of the ſoul from theſe ſix topics. 1. Its ſimplicity. 2. Its independency on the body, which is twofold; in its *eſſe*, and in its *operari*, in exiſting, and in acting or operating ſeparately. 3. Its rule and authority over the body. 4. Its likeneſs and ſimilitude to God, which diſcovers itſelf in the pleaſure it enjoys in ſpiritual things, in its aiming at ſpiritual objects, &c. 5. Its ſpiritual manner of perceiving material objects. And, laſtly, its indiviſibility, capacity, activity, and immortality. See SOUL.

IMMEDIATE, that which precedes or follows ſome other thing, without any interpoſition.

IMMEDIATE, alſo, ſignifies ſomething that acts without means, or without medium. In which ſenſe we ſay, *immediate* GRACE, and *immediate* cauſe, &c.

IMMEDIATE *Mode*. } *See* { MODE.
IMMEDIATE *Fire*. } { FIRE.

IMMEMORIAL, an epithet given to the time or duration of any thing whoſe beginning we know nothing of.

In a legal ſenſe, a thing is ſaid to be of time *immemorial*, or time out of mind, that was before the reign of our king Edward II.

IMMENSE, that whoſe amplitude, or extenſion, no finite mea-

measure whatsoever, or how oft soever repeated, can equal.

IMMERSION, an act by which any thing is plunged into water, or some other FLUID.

In the first ages of Christianity, baptism was performed by *immersion*; by three *immersions*.—The custom of *immersion* is said to be still preserved in Portugal, and among the Anabaptists in other parts.

IMMERSION, in *Pharmacy*, is the preparation of some medicine, by letting it steep for some time in water, in order to take some ill quality or taste from it.

This is done in rhubarb, to moderate its force; in lime to take away its salt; and in olives, which are preserved in brine.

IMMERSION, in *Astronomy*, is when a star or planet comes so near the sun, that we cannot discern it; being as it were enveloped, and hid in the rays of that luminary.

IMMERSION also denotes the beginning of an eclipse of the moon; that is, the moment when the moon begins to be darkened, and to enter into the shadow of the earth.

The same term is also used with regard to an eclipse of the sun, when the disk of the moon begins to cover it.

In this sense, *immersion* stands opposed to *emersion*, which signifies the moment wherein the moon begins to come out of the shadow of the earth; or the sun begins to shew the parts of his disk which were hid before.

IMMERSION is frequently applied to the satellites of Jupiter, and especially to the first satellite; the observation whereof is of so much use for discovering the longitude.

The *immersion* of that satellite is the moment in which it appears to enter within the disk of Jupiter; and its emersion the moment wherein it appears to come out.

The *immersions* are observed from the time of the conjunction of Jupiter with the sun, to the time of his opposition: and the emersions from the time of his opposition to his conjunction.—The peculiar advantage of these observations is, that during eleven months of the year, they may be made, at least, every other day.—The perfection of this theory, and the praxis thereon, we owe to M. Caffini.

Scruples of IMMERSION. See SCRUPLE.

IMMERSUS *scapulæ*, in *Anatomy*, a name given by Riolanus and some other authors, to a muscle since called the SUBSCAPULARIS.

IMMORTAL, that which will last to all eternity, as having in itself no principle of alteration, or corruption.

Plato defines *immortality*, τὸ ἀεὶ ἐν κινήσει ὂν, *what is ever in motion, animated essence and eternal monition*; and proves the *immortality* of the soul from two kinds of arguments; the one *artificial*, and the other *inartificial*.

The *inartificial* arguments for the soul's *immortality* are testimonies and authorities, whereof he cites several; and adds, in general, that all the great men and poets, who had any thing divine in them, have at all times asserted the *immortality* of the soul.

Artificial or proper arguments for the *immortality* are either *speculative* or *practical*: of the first kind are those drawn from, 1. The simple, uniform, spiritual, and divine nature of the soul. 2. From its infinite capacity. 3. Its desiring and longing after *immortality*, and its inward horror of falling into nothing; proving it absurd that the soul should die, when life is its proper and adequate object. 4. Its rational activity; proving that whatever has in itself a principle of rational and spontaneous motion, by which it tends towards some supreme good, is *immortal*. 5. The various ideas which it has of spiritual things; particularly the idea it has of *immortality*: and, 6. Its immateriality.

His *practical* or moral arguments for the *immortality* of the soul, are drawn from, 1. The justice of God, which can never suffer the wicked to escape unpunished, nor the good unrewarded after death. 2. The dependence which religion has on this opinion, because, without this perfuasion, there would be no religion in the world. 3. The opinion which men have, that justice and every kind of virtue are to be cultivated, that they may at last live with God. 4. The stings of conscience, and anxious solicitude we are under about a future state.

IMMORTAL *flower*, in *Botany*. See GOMPHRENA.

IMMUNITY, a privilege or exemption from some office, duty, or imposition.

Immunity is more particularly understood of the liberties granted to cities and communities.

The princes heretofore granted all kinds of *immunities* to ecclesiastics, exempting them from all impositions; but the ecclesiastics of those days were not so rich as those of ours: they gave all they had to the poor.

There is still a privilege of *immunity* in some places, and especially in Italy, belonging to ecclesiastical things, and persons; who are exempted from certain dues, and are sheltered from the pursuits of justice. Though there are some crimes for which they cannot plead the privilege of their *immunity*, as premeditated murder, &c.

IMMUTABILITY, the condition of a thing that cannot change.

Immutability is one of the divine attributes. See GOD.

IMPALED, in *Heraldry*, is understood of a shield party per pale, or divided into two halves by a line drawn pale-wise through the middle, from the top to the bottom.

When the coats of arms of a man and his wife, who is not an heiress, are borne in the same escutcheon, they must be *impaled*, or marshaled in pale, i. e. the husband's on the right side, and the wife's on the left; and that he heralds call *baron and feme*, two coats *impaled*.

If a man have had two wives, he may *impale* his own in the middle between theirs; and if he have had more than two, they are to be marshalled on each side of his own in their proper order.

IMPALEMENT, in a *penal* sense, } See EMPALEMENT.
IMPALEMENT, in *Physiology*.

IMPALPABLE, that whose parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPANATION, formed of *in* and *panis*, *bread*, a term used among divines to signify the opinion of the Lutherans with regard to the eucharist; who believe that the species of bread and wine remain, together with the body of our Saviour, after consecration. See CONSUBSTANTIATION.

IMPANATORES. See ADESSENARII.

IMPANNELING, in *Law*. See EMPANELLING.

IMPARES *Scamilli*. See SCAMILLI.

IMPARLANCE. See EMPARLANCE.

IMPARSONEE, in *Law*, is applied to a parson that is inducted, and in possession of a benefice.

IMPASSIBLE, that which is exempt from sufferings; or which cannot undergo pain, or alteration.

The Stoics place the soul of their wise man in an *impassible*, imperturbable state. See APATHY.

IMPASTATION, the mixture of divers materials of different colours, and consistencies, baked or bound together with some cement, and hardened either by the air, or fire.

IMPASTATION is sometimes used for a sort of mason's-work, made of stucco, or stone ground small, and wrought up again in manner of a paste.

Authors are of opinion that the obelisks, and the huge antique columns still remaining, were made, some by *impastation*, and others by fusion; but this is wholly erroneous: they are all cut out of quarries, yet open in Egypt, Arabia, &c.

IMPASTING, in *Painting*. See EMPASTING.

IMPATIENS, in *Botany*. See BALSAMINA.

IMPEACHMENT, from the Latin, *impetere*, to *set upon* or *attack*; or rather from the French, *empecher*, to *hinder*, in *Law*, is the accusation and prosecution of a person for treason, or other crimes and misdemeanors.

Any member of the lower house of parliament may impeach any one belonging either to that body, or the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an *impeachment*. 12 and 13 Will. III. c. 2. A commoner cannot, however, be impeached before the lords for any capital offence, but only for high misdemeanors. A peer may be impeached for any crime; the articles of *impeachment* are a kind of bills of indictment, found by the house of commons, and afterwards tried by the lords, who, in cases of misdemeanors, are considered not only as their own peers, but as the peers of the whole nation. This custom is derived from the constitutions of the ancient Germans, who, in their great councils, sometimes tried capital accusations relating to the public, *licet apud concilium accusare quoque, et discrimen capitis intendere*. Tacit. de Mor. Germ. 12. Blackst. Com. vol. iv. p. 256, &c.

IMPEACHMENT *of Waste*, a restraint from committing of waste upon lands and tenements; or a demand of recompence for waste made by a tenant who has but a limited estate in the land granted.

He that hath a lease without *impeachment of waste*, hath by that a property or interest given him in the houses and trees, and may make waste in them without being called to an account for it.

IMPECCABILES, in *Church History*, a name given to those heretics, who boasted that they were *impeccable*, and that there was no need of repentance: such were the Gnostics, Priscillianists, &c.

IMPECCABILITY, the state of a person who cannot sin: or a grace, privilege, or principle which put him out of a possibility of sinning.

The schoolmen distinguished several kinds and degrees of *impeccability*: that of God, belongs to him by nature: that of Jesus Christ, considered as man, belongs to him by the hypostatical union: that of the blessed, is a consequence of their condition: that of men, is the effect of a confirmation in grace, and is rather called *impeccance* than *impeccability*; accordingly divines distinguish between these two: this distinction is found necessary in the disputes against the Pelagians, in order to explain certain terms in the Greek and Latin fathers, which without this distinction are easily confounded.

IMPEDIMENTS, in *Law*, are such hindrances as put a stop or stay to a person's seeking for his right by a due course of law. Persons under *impediments* are those under age, or coverture, *non compos mentis*, in prison, beyond sea, &c. who, by a saving in our laws, have time to claim, and prosecute their rights, after the impediments are removed, in case of fines levied, &c.

IMPEDIMENTS of *marriage*, see MARRIAGE.

IMPEDIT, in *Law*. See QUARE *Impedit*.

IMPENETRABILITY, a quality whereby a thing becomes unable to be pierced or penetrated; or a property of body whereby it fills up certain spaces, so that there is no room in them for any other body.

Dr. Harris defines *impenetrability*, the distinction of one extended substance from another, by means whereof the extension of one thing is different from that of another: so that two extended things cannot be in the same place, but must necessarily exclude each other. See SOLIDITY.

IMPENITENCE, or IMPENITENCY, a hardness of heart, which makes a person persevere in vice, and prevents his repentance.

IMPERATIVE, in *Grammar*, is one of the moods or manners of conjugating a verb, serving to express a commandment; as, *go, come*, &c. The *imperative*, according to bishop Wilkins, is one of the primary modes, or moods, the indicative being the other: by this the speaker expresses his will to him that has the thing in his power; namely, to his superior by petition, to his equal by perswasion, and to his inferior by command; and the manner in which these affect the copula (be it so, or let it be so) is called the *imperative* mood, of which there are these three varieties. Wilkins's Real Character, part iii. c. 5. The same distinction is observed by Mr. Harris, who makes the *imperative* mood a species of the requisitive when applied to inferiors, but when pertaining to equals, or superiors, it is precative or optative. Hermes, p. 144, ed. 2d. See MOOD.

In Hebrew, and other oriental languages, the future tense has frequently an *imperative* signification.

IMPERATOR, among the *Romans*, a title of honour given to generals after a victory; first by the ACCLAMATIONS of the soldiers, and afterwards confirmed by the senate. See EMPEROR.

IMPERATORIA, in *Botany*, see MASTERWORT.

IMPERATRIX, in *Botany*, a name given by some authors to rhubarb, or SPIGNEL.

IMPERFECT *Plants*, among *Botanists*, are such as either really want flower and seed, or are supposed to want them; no flower or seed having been discovered in the greater part of those plants included in this class by the botanical writers, at the time when they were thus denominated. See *Imperfect* PLANTS.

IMPERFECT *concord*, in *Musick*, see CONCORD.

IMPERFECT *flowers*. See FLOWERS and STAMINEOUS.

IMPERFECT *mixt*. See MIXT.

IMPERFECT *numbers*, in *Arithmetic*, see NUMBERS.

IMPERFECT *tense*, in *Grammar*, signifies an indefinite time between the present and the past; as, *I taught, I heard*. The *imperfect* was sometimes employed by the ancients to denote what is usual and customary: thus *ferebat* and *ferebat* signify not only *he* WAS *riding, he* WAS *writing*, but upon occasion they signify, *he* USED *to ride, he* USED *to write*. The reason of this is, that whatever is customary, must be something which has been frequently repeated; but what has been frequently repeated must require an extension of time past. It was also used by the ancients, in which they have been followed by the moderns, in a suspensive kind of inscription; as ANNIUS *fecit, Apelles faciebat*, but not *makes* or *feigns*; by which use of the *imperfect* they avoid the shew of ignorance, and had prepared an apology in case of censure, by saying that the work was *once looked in hand*, without pretending that *it was ever finished*. Harris's Hermes, p. 136, &c. See TENSE.

IMPERFORATE *anus*. See ANUS and INFANT.

IMPERIAL, something belonging to an emperor, or empire.

Thus we say, his *imperial* MAJESTY, the *imperial* CROWN, *imperial* MEDALS, the *imperial* CHAMBER.

IMPERIAL *cities*, in Germany, are those which own no other head but the emperor.

These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor, and pays him the Roman month; but in other respects, and in the administration of justice, the magistrate is sovereign. The *imperial cities* have a right of coining money, and of keeping forces, and fortified places: their deputies assist at the *imperial* diets, where they are divided into two branches; that of the Rhine, and that of Swabia. There were formerly twenty-two in the former, and thirty-seven in the latter; but there are now only forty-nine in all; thirteen belonging to the former, and thirty-six to the latter.

IMPERIAL *diet*, is an assembly or convention of all the states of the empire. See DIET.

The *diet* is divided into three *colleges*, and each college has its *director*, who presides in the consultations: the elector of Mentz, in the college of electors; the archbishop of Saltzburg, and archduke of Austria, in that of the princes, and the deputy of the city of Cologne, or of any other, in that of the cities.

In the *diet*, each principality has a voice; but all the prelates (so they call the abbots and provosts of the empire) have but two voices, and all the counts but four.

Though the three colleges agree, yet the emperor has a negative voice: when he also consents, the resolutions pass into a law, which obliges all the states of the EMPIRE, both mediate and immediate.

IMPERIAL *salt*, *imperiale sal*, a term used by some of the old writers to express the common sal gemmæ; and used, by others, for the *sal ammoniacum*.

IMPERIAL *table*, in *Surveying*, an instrument made of brass, with a box and needle, staff, &c. used in measuring land.

IMPERII *recursus*. See RECURSUS *imperii*.

IMPERSONAL *verb*, in *Grammar*, is such an one, as is only used in the third person singular; as *oportet, licet*, &c. Every verb, says the ingenious Mr. Harris, whether active or passive, has in language a necessary reference to some noun for its nominative case: and the doctrine of *impersonal* verbs has been justly rejected by the best grammarians, both ancient and modern. Hermes, p. 175.

IMPERVIOUS, a thing not to be pervaded, or passed through; either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETIGO, in *Medicine*, an extreme roughness, and foulness of the skin, attended with an itching, and plentiful scurf.

In which sense it amounts to the same with *lichen, vulatica*, and *mentagra*.

The *impetigo* is a species of dry, petriginous itch, wherein scales or scurf succeed space, arising from saline corrosive humours thrown out upon the exterior habit of the body, by which means the internal parts are usually relieved.

It is divided into *mitis*, mild, not accompanied with any malignity; and *fera*, SAVAGE, which comes near to a leprosy. See ITCH and LEPROSY.

IMPETRATION, the act of obtaining any thing by request or prayer.

IMPETRATION was more particularly used in our statutes for the pre-obtaining of benefices and church-offices in England from the court of Rome, which did belong to the disposal of the king, and other lay patrons of the realm; the penalty whereof is the same with that of provisors, 25 E. III. See PROVISOR.

IMPETUS, in *Mechanics*. See FORCE, MOMENTUM, and MOTION.

Paracentric IMPETUS. See PARACENTRIC.

IMPING, in *Falconry*, the inserting a feather in the wing of a hawk, in the place of one that is broken.

IMPLANTATION. See TRANSPLANTATION.

IMPLEAD, to sue, or prosecute by course of law. See PLEADING.

IMPLEMENTS, formed either from the Latin *implere*, to *fill up*; or from the French *employer*, to *employ*; is used for all things necessary for a trade, or the furniture of an household.

In this sense we frequently find it used in wills, and conveyances of moveables.

IMPLEX *actio*n. See ACTION.

IMPLICATION, in *Law*, is where the law doth imply something, that is not declared between parties, in their deeds and agreements; and when our law giveth any thing to a man, it giveth *implicitly* whatever is necessary for the enjoying the same. The want of words may be helped in some cases by *implication*; and so one word or thing, or one estate given, shall be implied by another; and there is an *implication* in wills and devises of lands, whereby estates are gained.

IMPLICIT, derived from *in*, and *plico*, *I fold*; something tacitly comprised, or understood: that is, contained in a discourse, clause, or proposition, not in express terms, but only by induction and consequence.

IMPLICIT *faith*. See FAITH.

IMPLICIT *condition*. See CONDITION.

IMPLY *a contradiction*, a phrase used among philosophers, in speaking of the object of divine omnipotence.

God can do every thing that does not *imply a contradiction* proceeding from God: by which is not meant a relation of the action to the executive power of God, but a relation to the other attributes and simple perfections of God.

IMPORTANCE *of Action, in Poetry*. See ACTION.

IMPORTATION, the act of *importing* or bringing merchandize from foreign countries, in contradistinction to EXPORTATION.

Some of the principal statutes relating to the *importation* of merchandize, are 12 Car. II. c. 4.—12 Car. II. c. 19. 14 Car. II. c. 11.—4 and 5 W. and M. c. 5.—6 W. and M. c. 1.—7 and 8 W. and M. c. 28.

Concerning goods prohibited from being *imported*, see *stat.* 3. Edw. IV. c. 4.—1 Rich. III. c. 12.—13 and 14 Car. II. c. 13.—18 Car. II. c. 3.—9 and 10 W. III. —21 Geo. II.—1 Ann. c. 27.

IMPOSITION *of hands*, an ecclesiastical action by which a bishop lays his hand on the head of a person, in ordination, confirmation, or in uttering a blessing. This practice is also frequently observed by the Dissenters at the ordination of their ministers, when all the ministers present place their hands on the head of him whom they are ordaining, while one of them prays for a blessing on him and his future labours. This some of them retain as an ancient practice, justified by the example of the apostles, when no extraordinary gifts are conveyed. However, they are not agreed as to the propriety of this ceremony, nor do they consider it as an essential part of ordination.

Imposition of hands was a Jewish ceremony, introduced, not by any divine authority, but by custom: it being the practice among those people, whenever they prayed to God for any person, to lay their hands on his head.

Our Saviour observed the same custom, both when he confirmed his blessing on children, and when he cured the sick; adding prayer to the ceremony. The apostles likewise *laid hands* on those upon whom they bestowed the Holy Ghost.—The priests observed the same custom when any one was received into their body.—And the apostles themselves underwent the *imposition of hands* afresh, every time they entered upon any new design. In the ancient church, *imposition of hands* was even practised on persons when they married; which custom the Abyssinians still observe.

But this term, which, in its original signification, is general, is now restrained, by custom, to that *imposition* which is practised at ordination. Spanheim has written a treatise *De impositione manuum*; and Tribenhorius and Braunius have done the same. See *Imposition of* HANDS, and ORDINATION.

IMPOSITION *of homage*, &c. See DUTY, &c.

IMPOSSIBLE, that which is not possible, or which cannot be done or effected. A proposition is said to be *impossible*, when it contains two ideas which mutually destroy each other, and which can neither be conceived, nor united together in the mind.

Thus *it is impossible*, that a circle should be a square; because we conceive clearly, that squareness and roundness destroy each other by the contrariety of their figure.

There are two kinds of *impossibilities*, *physical* and *moral*.

Physical IMPOSSIBILITY, is that which is contrary to the laws of nature.

A thing is *morally* IMPOSSIBLE, when of its own nature it is possible, but yet is attended with such difficulties, as that, all things considered, it appears *impossible*.

Thus it is *morally impossible*, that all men should be virtuous; or that a man should throw the same number with three dice a hundred times successively.

A thing which is *impossible* in law, is the same with a thing *impossible* in nature: and if any thing in a bond or deed be *impossible* to be done, such deed, &c. is void. 21 Car. I. B. R.

IMPOSSIBLE *quantity*, in *Algebra*. See ROOT.

IMPOST, from *imponere*, *I impose*, in *Law*, properly denotes the tribute or tax appointed by a sovereign to be paid for such merchandize as is brought into any haven in his dominions from foreign nations. See DUTY.

Impost is distinguished from CUSTOM, in that custom more properly signifies the duties paid to the king for goods shipped off or exported. But the two are frequently confounded together.

IMPOSTHUME, by corruption from *impostem* and *apostem*, *abscessus*, a collection of matter, or pus, in any part of the body, either owing to an obstruction of the fluids in that part, which makes them change into such matter; or to a translation of it from some other part where it was generated. See ABSCESS.

IMPOSTORS, *religious*, are such as falsely pretend to an extraordinary commission from Heaven; and who terrify and abuse the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment.

IMPOSTS, in *Architecture*, the capitals of pillars, or pilasters, which support arches. See *Tab. Archit. fig.* 40, E. An *impost*, sometimes also called *chapiter*, is a sort of little cornice, which crowns a pier, and supports the first stone whence the arch or vault commences.

Imposts conform to their proper orders.—The Tuscan is a plinth only; the Doric has two faces crowned; the Ionic has a fillet, over the two faces, and its mouldings may be carved; the Corinthian and Composite have a fillet, freeze, and other mouldings.

The projecture of the *impost* must not exceed the [illegible] the pillaster. Sometimes the entablature of the [illegible] serves for the *impost* of the arch; and this look[illegible] grand and stately.

The *impost* is a thing essential to an ordonnance; [illegible] much so without it, in the place where the curve [illegible] the arch meets with the perpendicular line of the pi[illegible] there always seems a kind of elbow.

P in *fig.* 20, represents an *impost* made open or flat in the middle, and bounded by fillets or ogee. This kind of *impost* is said to be the invention of lord Burlington, and is by many called a *Burlington impost*. It is enriched with a *guilloe*, or bands forming circles and intersecting each other: when there are two rows, it is called a double *guilloe*.

The following rules are given by some modern authors for dividing the *imposts* of arches: in the Tuscan *impost*, the facia hath 3 parts, the ogee 1, the fillet $\frac{1}{4}$, the corona 3, and the band $1\frac{1}{2}$. For the projections, the facia $\frac{1}{2}$, the ogee 2 parts, corona 3, and the whole 3$\frac{1}{2}$.

In the Doric, the frieze 2, fillet $\frac{1}{4}$, astragal $\frac{1}{2}$, cyma recta 2$\frac{1}{2}$, fillet $\frac{1}{4}$, corona 2, ogee 1. For the projections, fillet $\frac{1}{4}$, astragal 1, corona 2$\frac{1}{2}$, and the whole 3$\frac{1}{2}$.

In the Ionic, fillet $\frac{1}{4}$, cyma 4, ovolo 1$\frac{1}{2}$, corona 1$\frac{1}{2}$, ogee 1. For the projections, cyma 1$\frac{1}{4}$, corona 2$\frac{1}{2}$, the whole 3$\frac{1}{2}$.

In the Corinthian, the frieze 1$\frac{1}{4}$, fillet $\frac{1}{4}$, astragal $\frac{1}{4}$, cyma 2$\frac{1}{2}$, ovolo 1, corona 1$\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{4}$, astragal $\frac{1}{4}$, cyma 1, corona 2$\frac{1}{2}$, the whole 3$\frac{1}{2}$.

In the Compesite, frieze 2, fillet $\frac{1}{4}$, astragal $\frac{1}{4}$, ovolo 1, cyma 1$\frac{1}{2}$, corona 1$\frac{1}{2}$, ogee 1. For the projections, fillet $\frac{1}{4}$, astragal $\frac{1}{4}$, ovolo 1$\frac{1}{2}$, cyma 2$\frac{1}{2}$, corona 2$\frac{1}{2}$, the whole 3$\frac{1}{2}$.

IMPOTENCE, or IMPOTENCY, derived from the preposition *in*, taken privatively, and *potentia*, *power*, a want of strength, power, or means, to perform any thing.

Divines and philosophers distinguish two kinds of *impotency*, *natural* and *moral*.—The first is want of some physical principle necessary to an action; or it is where a being is absolutely defective, or not free, and at liberty to act: the second only imports a great difficulty; a strong habit to the contrary; a violent passion, inclination, or the like.—*Impotency* is more particularly [illegible] a natural inability to coition.

In this sense, *impotency* is defined an inability [illegible] ency in the male to impregnate the female.

We have instances of unfitness for generation by an impediment to the ejection of the semen from a wrong direction, which the orifices of the [illegible] mountanum got, whereby the seed was thrown into the bladder. Mr. Petit cured one patient under such a difficulty of emission, by making an incision like to that commonly made in the *great* operation for the stone. See Mem. de l'Acad. de Chirurg. tom. i.

Impotence may be caused by various accidents, but most frequently takes its rise from early and immoderate [illegible]ry; and often from the venereal disease.

Impotency is a canonical disability, to avoid marriage in the spiritual court. The marriage is not void [illegible] but voidable only by sentence of separation, during [illegible] life of the parties.

IMPRACTICABLE *case*, in *Algebra*. See IRREDUCIBLE.

IMPRECATION, derive from *in*, and *precor*, *I pray*, a curse, or wish that some evil may befall any one.

The ancients had their goddesses called *Imprecationes*, Latin *Diræ*, i. e. *Deorum iræ*, who were supposed to be the executioners of evil consciencies. They were called *Diræ* in heaven, *Furies* on earth, and *Eumenides* in hell. The Romans owned but three of these *Imprecations*, and the Greeks only two. They invoked them with prayers, and pieces of verses, to destroy their enemies.

IMPREGNATION, derived from *impregnare*, of *pregnans*, a *woman with child*; the emission of the seed of the male in coition, by which the female conceives, or becomes with young. See GENERATION.

IMPREGNATION is also figuratively used in pharmacy, when a liquor imbibes the particles of some other body.

Thus a menstruum is said to be *impregnated* with a body dissolved in it, as much as its pores are able to receive.

IMPRESSED *species*. See SPECIES.

IMPRESSING, in the *Sea Language*. See MANNING *the fleet*.

IMPRESSION, in *Philosophy*, is applied to the species of objects which are supposed to make some mark or *impression* on the senses, the mind, and the memory.

The Peripatetics tell us, that bodies emit species resembling them, which species are conveyed by the exterior senses to the common sensory; these *impressed* species, being material and sensible, they say, are rendered intelligible by the active intellect; and, when thus spiritualized, are called *expressions*, or *expressed species*, as being expressed from the others.

IMPRESSION *is also frequently used in speaking of the editions of a book, or of the number of times it has been printed.*

Impression, however, differs from *edition*: the former, properly speaking, takes in no more than what belongs to the printing, the letter, paper, margin, page, distances of words and lines, and the disposition of every thing that may have a good or bad effect upon the eye: the latter, besides all this, takes in the care of the editor, who has revised the copy, corrected or augmented it, adding notes, tables, and other like things, which he judged might contribute towards making the book more useful and correct.

Indeed very frequently the word *edition* only refers to this latter part; as when, in speaking of the works of S. Augustine, we quote the edition of Erasmus, the Louvain's, Benedictine's, &c. where we have no regard to the printing part, but only to the care and pains of the editors.

Privilege for IMPRESSION. See PRIVILEGE.

IMPRESSIONS *on gems and medals*. See GEMS and MEDALS.

IMPREST. *Auditors of*. See AUDITORS.

IMPRISONMENT, the state of a person restrained of his liberty, and detained under the custody of another; and extends not only to a GAOL, but to a house, stocks, or a man's being field in the street, &c. None shall be imprisoned but by the lawful judgment of his peers, or by the law of the land. Mag. Ch. 9 Hen. III. c. 2. 25 Edw. III. ſt. 5. c. 4.

No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant: or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence, for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute, exactly pursues the statute in the manner of doing it, for otherwise it will be deemed false imprisonment, and in consequence it is unjustifiable. Every warrant of commitment for imprisoning a person, ought to run, "till delivered by due course of law," and not "Until further order," which has been held ill, and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed.

A person being sent to prison by a warrant from a secretary of state, without assigning any cause, &c. it was adjudged, that he ought to be discharged for that reason. Persons may also, by bail or habeas corpus, be discharged from their imprisonment in any case bailable. See the articles HABEAS CORPUS, BAIL, PRISON, PRISONER, and GAOL.

False IMPRISONMENT. See FALSE, and APPEAL.

IMPROMPTU. See INPROMPTU.

IMPROPER *fractions*. See FRACTIONS.

IMPROPRIATION, is a term used where the profits of an ecclesiastical benefice are in the hands of a layman.

In which sense it stands distinguished from APPROPRIATION, which is where the profits of a benefice are in the hands of a bishop, college, &c. though the two are now often used promiscuously.—There are said to be 3845 *impropriations* in England.

IMPROPRIETY, the quality of something that is not fit, or proper. See PROPER, and PROPRIETY.

Grammarians observe three kinds of faults in language; a SOLECISM, BARBARISM, and *impropriety*: an *impropriety* is committed when a word is used that has not a *proper* signification.

IMPROVIDE, in *Law*. See QUIA *improvidè*.

IMPULSIVE, a term in philosophy, applied to the action of the body which impels or pushes another.

Thus the arm is said to give an *impulsive* motion to the stone that it throws. See PROJECTILE.

In this sense, *impulsive* stands contradistinguished from *attractive* and *repulsive*.

Sir Isaac Newton suggests, that attraction itself may possibly be effected by an *impulsive* power.

IMPURITY, in the *Mosaic* law. There were several sorts of *impurity* contracted under the law of *Moses*. Some were voluntary, as the touching of a dead body, or of any animal that died of itself or of any creeping things; or unclean creature; or the touching things holy by one who was not clean, or was not a priest; or touching persons under *impure* circumstances. Other kinds of *impurity* there were, of an involuntary nature; for which we must refer the reader to Calmet, who shews what kind of purification was prescribed for each species of pollution. See Numb. xix. 11, 14. Levit. xi. 24, 43. Levit. xii. 23, 45. Id. xv. 25. Calm. Dict. Bibl. in voc.

IMPUTATION, a term much used among divines, sometimes in a good, and sometimes in an ill sense: in the *latter* it is used to signify the charging the *sin* to the account of one, which was committed by another. The word, however, is generally used in an ill sense; for when we place any good to the account of another, we use the word attribute.

Thus Adam's sin is said by some divines to be *imputed* to all his posterity; all his defects and, by his fall, becoming as criminal in the sight of God, as if they had fallen themselves; and bearing the just punishment of his first crime. *See Original* SIN.

Imputation, used in a good sense, signifies the charging of another's justice, or merit.

Thus the justice of Jesus Christ is said to be imputed to us; his merits, and the price of his *sufferings*, being applied to us.

IN, in the *Manege*.—*To put a horse in*, is an expression that signifies to breed and dress him, by putting him right upon the hand and the heels.

IN, in the *Sea language*, denotes the state of any of a ship's sails, when they are furled or stowed: it is used in opposition to *out*, which implies that they are set, or extended to assist the ship's course.

In-penny and out-penny, in *Our Old Writers*, money paid by the custom of some manors on the alienation of tenants, &c.—In-penny and out-penny *consuetudo talis est in villa de East Radham, de omnibus terris quæ infra Burgagium tenentur, viz. quod ipse, qui vendiderit vel dederit dictam tenuram alicui, dabit pro exitu suo de eadem tenura unum denarium, & simile de ingressu alterius; si vero predictis denarii a retro fuerint, bolleus domini distringet pro eisdem denariis in eadem tenura.* Registr. Prior. de Coketford, p. 25.

INACCESSIBLE *height, or distance*. See ALTITUDE, DISTANCE, &c.

INACHIA, Ἰναχία, *in Antiquity*, a festival in Crete, celebrated in honour of Leucothea, or Ino.

The word is compounded of Ino, and ἄχος, i. e. grief; being perhaps a commemoration of Ino's misfortunes.

INACTION, *cessation of action*, a term much used in the mystical divinity; by which is understood a privation, or annihilation, of all the faculties; whereby the door is, as it were, shut to all external objects, and a kind of ecstasy is procured, during which God speaks immediately to the *heart*. It is the state of *inaction* that is held the most proper for receiving the Holy Spirit; and in this fit of dozing, they say, it is that God communicates sublime and ineffable sentiments and graces to the soul.

Some do not make it consist in this stupid kind of indolence, or general suspension of all sensation: but by *inaction* only mean a cessation of desires, in which, as the soul does not determine itself to any positive acts, neither does it abandon itself to useless meditations, or the vain speculations of reason; but demands in general every thing that may be agreeable to God, without prescribing any thing to him.

This latter is the doctrine of the ancient mystics, and the former that of the modern ones, or the quietists.

In general, however, it may be said, that *inaction* is not the most likely way of pleasing God; by our actions chiefly we are to gain his favour; he will have us to act; so that *inaction* cannot be agreeable to him.

INACTIVITY *of matter*. See VIS *inertiæ*.

INADEQUATE *idea, or notion*, is a partial or incomplete representation of any thing to the mind. See IDEA.

INAJA *guacsiba*, in *Botany*, a name by which some authors have called the cocoa-nut tree, or *palma indica nucifera* of other writers.

INALIENABLE, that which cannot be validly alienated, or made over to another. See ALIENATION.

Thus the dominions of the king, the church, minors, &c. are *inalienable*, otherwise than with a reserve of the right of redemption for ever.

INAMBLUCIA, in *Natural History*, the name of a genus of fossils of the class of the selenites; but of the number of the columnar, not the rhomboidal kinds, and composed merely of parallel fibres. See SELENITES.

INAMELLING, or ENAMELLING. See ENAMELLING.

INANIMATE, derived from *in*, taken privately, and *anima*, *soul*, denotes a body that has either lost its soul or that is not of a nature capable of having any.

Thus, a dead man is an *inanimate* lump, and metals are *inanimate* bodies.

IN-

INANITION, a term in *Physic*, fignifying emptinefs; or the ſtate of the ſtomach, when it is empty, and needs food.

There are flatulencies which proceed from repletion, and others from *inanition*, which laſt are the more dangerous.

INANITY, the ſchool term for emptineſs or abſolute vacuity, and implies the abſence of all body and matter whatſoever, ſo that nothing remains but mere ſpace.

INARCHING, in *Gardening*, a particular ſort of grafting, called alſo *to ſome* grafting by approach. It is uſed when the ſtock intended to be grafted on, and the tree from which the graft is to be taken, ſtand ſo near one another, that they may be brought to touch. The branch to be *inarched* is to be fitted to that part of the ſtock where it is to be joined, the rind and wood are to be pared away on one ſide for the length of three inches, and the ſtock or branch where the graft is to be united is to be ſerved in the ſame manner, ſo that the two may join equally together, and the ſap meet; a little tongue is then to be cut upwards in the graft, and a notch made in the ſtock to admit it, ſo that when they are joined, the tongue will prevent their ſlipping, and the graft will more cloſely unite to the ſtock. Having thus brought them exactly together, they muſt be tied with ſome baſt or woollen, or other ſoft tying, and then the place muſt be covered with ſome grafting clay, to prevent the air from drying the wound, and the wet from rotting the ſtock; a ſtake muſt be fixed in the ground, to which both the ſtock and the graft muſt be tied, to prevent the winds diſplacing them. When they have remained in this ſtate four months, they will be ſufficiently united, and the graft may then be cut off from the mother-tree, obſerving to ſlope it cloſe to the ſtock, and at this time there ſhould be freſh clay laid all round the part. This operation ſhould be performed in April or May, that the graft may be perfectly united to the ſtock, before the enſuing winter. It is principally practiſed upon oranges, myrtles, jeſſamines, walnuts, and firs, and ſome other trees, which do not ſucceed well in the common way of grafting. But it is a wrong practice when orange trees are deſigned to grow large, for theſe are ſeldom long-lived after the operation. See ABLACTATION and ENGRAFTING.

INARTICULATE, an epithet applied to ſuch ſounds, ſyllables, or words, as are not pronounced diſtinctly. See ARTICULATION.

INAUGURATION, the coronation of an emperor or king; or the CONSECRATION of a prelate, ſo called in imitation of the ceremonies uſed by the Romans, when they were received into the college of augurs. See CROWN, KING, and BISHOP.

The word comes from the Latin *inaugurare*, which ſignifies to dedicate a temple, or to raiſe any one to the prieſthood, having, in order to that, firſt taken auguries. See AUGUR, and AUGURY.

INCA, or YNCA, an appellation which the natives of Peru give to their kings, and princes of the blood.

The chronicle of Peru relates the origin of the *incas*: this country had been a long time the theatre of all ſorts of wars, horrible crimes, and diſſenſions, till at length there appeared two brothers, the one of whom was called Manecapac: of this perſon the Indians uſe to tell wonders; they ſay he built the city of Cuzco, ſettled laws and policy, and taught them to adore the ſun: and he and his deſcendants took the name of *inca*, which, in the language of Peru, ſignifies *king*, or *great lord*. Theſe *incas* grew ſo powerful, that they made themſelves maſters of the whole country, from Chili to Quito, eſtabliſhing in every province their peculiar policy and religious inſtitutions, and held it till the diviſions between the brothers Huaſcar, and Atahualpa; which theſe princes under Pizarro laying hold of, made themſelves maſters of Peru, and put an end to the empire of the *incas*, in 1533. They number only twelve of theſe *incas*. It is ſaid, the moſt conſiderable among the nobles of the country ſtill bear the name of *inca*.

INCALESCENCE, compounded of *in*, and *calor*, or *calfco*, *I grow warm*, the growing hot of any thing, either by motion and friction, or as quick-lime does by pouring water on it.

INCALESCENT *mercury*, a name given by Mr. Boyle to ſome mercuries of an uncommon preparation; which, by being mingled with a due proportion of gold-leaves, or ſmall filings, would amalgamate and grow hot with the gold.

INCAMERATION, derived from *in*, and *camera*, *chamber*, in the *apoſtolic chancery*, the union of ſome land, right, or revenue, to the domains of the pope. See CHAMBER.

INCANTATION, derived from the Latin *in*, and *canto*, I *ſing*, (ſee CHARM, and CARMEN), *inchantment*; words and ceremonies uſed by magicians to raiſe devils; or rather to impoſe on the credulity of the people. See CONJURATION, FASCINATION, MAGIC, WITCHCRAFT, *&c.*

INCAPACITY, in matters of benefices among the canoniſts, is of two kinds: the one renders the proviſion of a benefice null in its original; the other is acceſſary, and annuls the proviſions which at firſt were valid.

Incapacities of the firſt kind, are the want of a diſpenſation for age in a minor, for legitimation in a baſtard, for naturaliſation in a foreigner, *&c.*

Of the latter kind, are grievous offences and crimes: as being concerned in giving a ſentence of death [illegible] *&c.* which they decree, except the benefice to all [illegible] *or render* the holding it irregular.

INCARNATION, in *Theology*, ſignifies the act whereby the Son of God aſſumed the human nature; or the myſtery by which Jeſus Chriſt, the eternal word, was made man, in order to accompliſh the work of our redemption. The æra uſed among Chriſtians, whence they number their years, is the time of the *incarnation*, that is, of Chriſt's conception in the virgin's womb.

This æra was firſt eſtabliſhed by Dionyſius Exiguus, about the beginning of the ſixth century, till which time the æra of Diocleſian had been uſed.

Some time after this, it was conſidered, that the years of a man's life were not numbered from the time of his conception, but from that of his birth: which occaſioned them to poſtpone the beginning of this æra, for the ſpace of one year, retaining the cycle of Dionyſius entire, in every thing elſe.

At Rome they reckon their years from the *incarnation*, or birth of Chriſt, that is, from the 25th of December, which cuſtom has obtained from year 1431. In France, and ſeveral other countries, they alſo reckon from the *incarnation*: but then they differ from each other in the day of the *incarnation*, fixing it, after the primitive manner, not to the day of the birth, but conception of our Saviour. Though the Florentines retain the day of the birth, and begin their year from Chriſtmas. See PETAV. de Doct. Temp. Grandamicus de Dei Nat. See ÆRA and EPOCHA.

INCARNATION, formed from *in*, and *caro*, *fleſh*, in *Surgery*, ſignifies the healing and filling up ulcers and wounds with new fleſh.

INCARNATIVE, in *Medicine* and *Surgery*, is applied to medicines, bandages, and future which diſpoſe a wound or ulcer to fill up with fleſh. Whence they are alſo called *anaplerotics*, from *ana*, *again*, and *πληρω*, *to fill*.

INCARNATIVE *medicines*, ſuch an one as makes the fleſh heal and unite.

INCARNATIVE *bandage*. See BANDAGE.

INCARNATIVE *future*. See SUTURE.

INCARTATION, in *Chemiſtry*, the refining of gold, by means of ſilver, and aqua fortis.

This is the ſame with what is otherwiſe called [illegible] See DEPART.

INCENDIARY, *incendiarius*, in *Law*, is applied to [illegible] who is guilty of maliciouſly ſetting fire to another [illegible] ing-houſe, and all outhouſes that are parcel [illegible] though not contiguous to it nor under the ſame [illegible] barns and ſtables. A bare intent, or attempt to do [illegible] by actually ſetting fire to a houſe, unleſs it ablolu[illegible] burns, does not fall within the deſcription of *incendium conſumptum*. But the burning and conſuming of any [illegible] is ſufficient; though the fire be afterwards extinguiſhed. It muſt alſo be a malicious burning; otherwiſe it is only treſpaſs. This offence is called ARSON in our law.

Among the ancients, criminals of this kind were to be burnt. *Qui aries, incrumenque frumenti juxta domum poſitum ſciens, prudenſque dolo made combuſſerit, vinctus igni necetur.*

The puniſhment of *arſon* was death by our ancient laws and by the Gothic conſtitutions: and in the [illegible] Edward the Firſt, *incendiaries* were burnt to death [illegible] ſtat. 8 Hen. VI. c. 6. made the wilful burning of [illegible] under ſpecial circumſtances, high treaſon; but it [illegible] duced to *felony* by the general acts of Edward [illegible] queen Mary. This offence was denied the benefit [illegible] clergy by 23 Hen. VIII. c. 1. which ſtatute was repealed by 1 Edw. VI. c. 12; and arſon was held to be outſted of clergy, with reſpect to the principal, by inference from the ſtat. 4 and 5 P. and M. c. 4. which expreſſly denied it to the acceſſary; though now it is expreſsly denied to the principal alſo, by 9 Geo. I. c. 22. See BLACK-*act*. See alſo FIRE-*ſtocks*.

INCENSE, from *incenſum*, q. d. *burnt*; as taking the effect from the thing itſelf; an aromatic, odoriferous reſin; otherwiſe called FRANKINCENSE.

INCEPTIVE, a word uſed by Dr. Wallis to expreſs ſuch moments, or firſt principles, which, though of no magnitude themſelves, are yet capable of producing ſuch as are. See INFINITE, and INDIVISIBLE.

Thus a point has no magnitude itſelf, but is *inceptive* of a line which it produces by its motion. So a line, though

it have no breadth, is yet *inceptive* of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCERATION, among *apothecaries*, the mixing of liquids with fomething that is dry, by a gentle foaking, till the compofition be brought to a fubftance of the conſiſtence of ſoft wax.

INCERTAINTY, in *Law*, is that which oppoſeth certainty; where a thing is ſo ambiguouſly ſet down, that the plain meaning cannot be underſtood: and this is ſaid to be the mother of contention. The queſtions of *uncertainty* ariſe ſometimes on matter of record, as writs, counts, pleas, verdicts, &c. and ſometimes on deeds or writings, or upon contracts, &c. 5 *Rep.* 121. *Plowd.* 25. In law proceedings, *incertainty* will make them void; for all proceedings in law are to be certain and affirmative; but the defendant may be at a certainty as to what he ſhould anſwer, &c. *Plowd.* 84. If the court and verdict in an appeal be uncertain, there can be no judgment given thereon; and it is the ſame on an indictment. 3 *Mod.* 121. *Incertainty* in deeds renders them void; but ſometimes a term for years granted by leaſe, may be made certain by reference to certainty: and *incertainty* may be reduced to certainty by matter, *ex poſt facto*, implication, &c. *Plowd.* 6. 273. 6 Rep. 20. If there are two men of one name, and a deviſe of lands, &c. is to one of that name, without any diſtinction, it will be void for *incertainty*; though perhaps an averment may make it good. 2 *Buſſtrode*, 180. *Incertainty* in declarations of ſales, of fines, of lands, &c. is rejected in law; for otherwiſe there would be no certain inheritances. 9 *Rep.*

INCEST, the crime of venereal commerce between perſons who are related in a degree prohibited marriage by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinſfolks, to the end that the affection, ſo neceſſary to marriage, might be heightened by this double tie; and yet the rules of the church have formerly extended this prohibition even to the ſeventh degree, but time has now brought it down to the third or fourth degree. See MARRIAGE.

Moſt nations look on *inceſt* with horror, Perſia and Egypt alone excepted. In the hiſtory of the ancient kings of thoſe countries we meet with inſtances of the brother's marrying the ſiſter: the reaſon was, becauſe they thought it too mean to join in alliance with their own ſubjects: and ſtill more ſo, to have married into the families of any foreign princes.

As to the Perſians, there was a ſtill more abominable ſort of *inceſt* practiſed by their magi: if we may truſt Catullus, *carm.* 91.

Nam magus ex matre & gnato gignatur oportet,
Si vera eſt Perſarum impia religio.

In 1650, *inceſt* and wilful ADULTERY were made capital crimes; but at the Reſtoration it was not thought proper to renew a law of ſuch unfaſhionable rigour: and theſe offences have been ever ſince left to the feeble coercion of the ſpiritual court, according to the rules of the canon law.

Spiritual INCEST, is the like crime committed between two perſons who have a ſpiritual alliance, by means of baptiſm, or confirmation.

Spiritual INCEST is alſo underſtood of a vicar, or other beneficiary, who enjoys both the mother and the daughter; that is, holds two benefices, the one whereof depends on the collation of the other.

Such a *ſpiritual inceſt* renders both the one and the other of thoſe benefices void.

INCESTUOUS, the name of a ſect or hereſy, which aroſe in Italy about the year 1667.

The hereſy of the *Inceſtuous* had its beginning at Ravenna; the learned of which place, being conſulted by the Florentines about the degrees of affinity which prohibit marriage, made anſwer, that the ſeventh generation, mentioned in the canons, was to be taken on both ſides together; ſo that four generations were to be reckoned on one ſide, and three on the other.

They proved this their opinion by a paſſage in Juſtinian's Inſtitutes, where it is ſaid, that a man may marry his brother's or ſiſter's grandaughter, though ſhe be but in the fourth degree: whence they concluded, that if my brother's grand-child be in the fourth degree with reſpect to me, ſhe is in the fifth with reſpect to my ſon, in the ſixth with reſpect to my grandſon, and in the ſeventh with reſpect to my great grandſon.

Peter Damian wrote againſt this opinion, and pope Alexander II. condemned it in a council held at Rome.

INCH, a known Engliſh meaſure, the twelfth part of a FOOT.

INCH *of candle*, a manner of ſelling goods among merchants. The method of it is thus.—Notice is uſually given upon the Exchange in writing and elſewhere, when the ſale is to begin: againſt which time the goods are divided into ſeveral parcels, called *lots*, and papers printed of the quantity of each, and of the conditions of ſale; as, that none ſhould bid leſs than a certain ſum more than another had bid before. During the time of the bidding, a ſmall piece, of about an *inch*, of wax-candle, is burning; and the laſt bidder, when the candle goes out, has the lot or parcel expoſed to ſale.

INCHASING, *in Sculpture*. See ENCHASING.

INCHOATIVE, a term ſignifying the beginning of a thing, or action; the ſame with what is otherwiſe called *inceptive*.

INCHOATIVE *verbs*, denote, according to Priſcian and other grammarians, verbs that are characteriſed by the termination *ſco* or *ſco*, added to their primitives: as *augeſco* from *augeo*, *calefco* from *caleo*, *duleſco* from *dulceo*, *trafcor* from *tra*, &c.

INCIDE, *cut*.—Thoſe medicines are ſaid to *incide*, which conſiſt of pointed, and ſharp particles: as acids, and moſt ſalts: by the force or inſinuation of which the particles of other bodies, which before cohered, are divided from one another.

And thus ſome expectorating medicines are ſaid to *incide*, or cut the phlegm, when they break it, ſo as to occaſion its diſcharge. See EXPECTORATION.

INCIDENCE, in *Mechanics*, expreſſes the direction in which one body ſtrikes on another; otherwiſe called INCLINATION.

In the incurſions of two moving bodies, their *incidence* is ſaid to be *perpendicular* or *oblique*, as their directions or lines of motion make a ſtrait line, or an oblique angle at the point of contact.

Angle of INCIDENCE, commonly denotes the angle comprehended between an *incident* ray, or other body, and a perpendicular to the plane in the point of *incidence*.

Thus ſuppoſing AB (*Tab.* II. *Optics*, *fig.* 26.) an incident ray proceeding from the radiant point A, to B the point of *incidence*, and HB a perpendicular to DE in the point of *incidence*: the angle ABH, comprehended between AB and HB, is the *angle of incidence*, by others called the *angle of inclination*.

Angle of INCIDENCE is alſo uſed by Dr. Barrow, and ſome others, for the complement of the above angle, or of the angle of inclination.

Thus, ſuppoſing AB an *incident* ray, and HB a perpendicular, as before; the angle ABD comprehended between it and the reflecting or refracting plane DE, *is* the *angle of incidence*; and the angle ABH, the angle of inclination.

Others, with Wolfius, make another diſtinction: which ſee under the articles ANGLE, REFLECTION, and REFRACTION.

It is demonſtrated by optical writers, 1°, That the *angle of incidence*, ABH, *fig.* 26. is always equal to the angle of reflection HBC, or the angle ABD to the angle CBE, and they lie in the ſame plane. See REFLECTION.

2°, That the ſines of the *angles of incidence* and refraction are to each other accurately, or very nearly in a given ratio. See REFRACTION.

3°, That from air to glaſs the ſine of *the angle of incidence* is to the ſine of the refracted angle as 300 to 193, or nearly as 14 to 9: on the contrary, that from glaſs to air, the ſine of the *angle of incidence*, is to the ſine of the refracted angle as 193 to 300, or as 9 to 14. See REFRACTION.

It is true, ſir Iſaac Newton having ſhewn, that the rays of light are not all equally refrangible, there can be no preciſe ratio fixed between the ſines of the angles of refraction and *incidence*: but the proportion which comes neareſt, is that above ſpecified. See LIGHT, COLOUR, REFRANGIBILITY, &c.

INCIDENCE *of eclipſe*. See ECLIPSE and IMMERSION.

Axis of INCIDENCE. See AXIS *of incidence*. Such is the line BH, *fig.* 26.

Cathetus of INCIDENCE. See CATHETUS *of incidence*; ſee alſo REFLECTION.

Line of INCIDENCE, in *Catoptrics*, denotes a right line, as AB, *Tab.* II. *Optics*, *fig.* 26. whereby light is propagated from a radiant point A, to a point B, in the ſurface of a ſpeculum.—This is alſo called an *incident ray*.

Line of INCIDENCE, in *Dioptrics*, is a *right line*, as AB, *Tab.* IV. *fig.* 56. whereby light is propagated unrefracted, in the ſame medium, from the radiant point to the ſurface of the refracting body HKLI.

Point of INCIDENCE, is the point B on the ſurface of the reflecting or refracting medium, in *fig.* 26. and *fig.* 56. on which the incident ray falls.

Scruples of INCIDENCE. See SCRUPLES.

INCIDENT, in a general ſenſe, denotes an event, or a particular circumſtance of ſome event.

INCIDENT, in *Law*, is a thing appertaining to, or following

ing another, that is more worthy or principal. A court-baron is inseparably *incident* to a manor; and a court of pie-powders to a fair.

INCIDENTS, in the *Materia Medica*. See ATTENUANTS.

INCIDENT, in a *Poem*, is an episode, or particular action, joined to the principal action, or depending on it.

A good comedy is to be full of agreeable *incidents*, which divert the spectators, and form the intrigue. The poet ought always to make choice of such *incidents* as are susceptible of ornament suitable to the nature of his poem. The variety of *incidents* well conducted makes the beauty of an heroic poem, which ought always to take in a certain number of *incidents* to suspend the catastrophe, that would otherwise break out too soon.

INCIDENT *ray*. See RAY, INCIDENCE, and INCLINATION.

INCINERATED *salts*, the same with lixivial salts. See the following article, and LIXIVIAL.

INCINERATION, derived from *in*, and *cinis*, *ashes*, in *Chemistry*, the reduction of vegetables into ashes, by burning them gently.

Thus fern is *incinerated* for the making of glass.

INCISION *cranial*. See CRUCIAL.

INCISION, *grafting by double*. See ENGRAFTING.

INCISIVE, INCISIVES, in *Anatomy*, is applied to several teeth, a double muscle, and certain orifices situated near those teeth.

INCISIVE *dentes*. See *Cutting* TEETH.

INCISIVUS is also an appellation given to the first proper muscle of the upper lip; because it has its origin in the bone of the upper jaw, near the place of the *incisive* teeth; hence it passes, and is inserted, into the upper lip, which it serves to draw up. The maxillary bones have four internal orifices, two whereof are called *incisiva*, as being directly under the *dentes incisivi*.

INCISORIUS *musculus*, in *Anatomy*, a name given by Santorini to the muscle called by Albinus *levator labii superioris* and *elevator labii superioris*, by Cowper. See the preceding article. Of these muscles, called *incisivi*, or *incisorii*, there are the *superiores Cowperi*, which arise from the alveoli of the lateral *incisores* of the lower jaw, and are inserted into the middle of the *semilunares* of the lower lip. There are also the *incisorii laterales*, which are a sort of *biceps* muscles, uniting into one at their lower end: they arise from the os maxillare, below the middle tendon of the orbicularis palpebrarum, and below the edge of the orbit in the os maxillare, near the union of this bone with the os malæ. Their two portions, on each side, unite about the lateral cutting teeth. The *incisorii medii*, called also the *anterior muscles* of Cowper, or lesser upper *incisorii*, are two small short muscles, situated near each other, below the septum narium; they rise from the os maxillare, on the alveoli of the first incisores, and are inserted into the middle and upper part of the upper lip.

INCLAVE, in *Heraldry*, a term used by Morgan to express an irregular line in heraldry, differing from the indented, invected, and all the others. It is called by some potent, and by others the dowcet line, from its resemblance to that joint, known among our joiners by this name. It is also called by some the labelled line. It has these names from the figure of the points, as they proceed from the ordinary, such as a chef or fess resembling the ends of labels.

INCLINATION, in *Medicine* and *Chemistry*, the operation of pouring off a clear liquor from some feces, or sediment, by only gently stooping the vessel.

This amounts to the same with what is otherwise called DECANTATION.

INCLINATION, in *Physics*, expresses the mutual approach or tendency of two bodies, lines, or planes, towards one another; so that their directions make at the point of contact an angle of a greater or lesser magnitude.

INCLINATION *of a right line to a plane*, is the acute angle, which such a right line makes with another right line drawn in the plane through the point where the inclined line intersects it, and through the point where it is also cut by a perpendicular drawn from any point of the inclined lines.

INCLINATION *of Meridians*, in *Dialling*, the angle that the hour-line, on the plane, which is perpendicular to the dial plane, makes with the meridian.

INCLINATION *of an incident ray*, otherwise called the *angle of inclination*. See *Angle of* INCIDENCE.

INCLINATION *of a reflected ray*, is the angle which a ray after reflection makes with the axis of *inclination*.

Thus, if AB, *Tab.* II. *Opt. fig.* 28. be the incident ray, HB a perpendicular to DE in the point B, and BC the reflected ray, CBH will be the *inclination of the reflected ray*, and ABH the *inclination* of the incident ray.

INCLINATION *of the axis of the earth*, is the angle which it makes with the plane of the ecliptic; or the angle between the planes of the equator and ECLIPTIC.

INCLINATION *of the magnetical needle*. See DIPPING *needle*.

INCLINATION *of a planet*, is an arch or angle comprehended between the ecliptic, and the place of a planet in his orbit.

The greatest *inclination* of Saturn, according to Kepler, is 2° 32′ 1″ of Jupiter 1° 20′ 1″ of Mars 1° 30′ 20″, of Venus 3° 21′ 1″ of Mercury 6° 54′. According to de la Hire, the greatest declination of Saturn is 2° 33′ 30″; of Jupiter 1° 19′ 20″; of Mars 1° 51′ 0″; of Venus 3° 23′ 3″; of Mercury 6° 52′ 0″. See JUPITER, MARS, MERCURY, &c.

INCLINATION *of a plane*, in *Dialling*, is the arch of a vertical circle, perpendicular both to the plane and the horizon, and intercepted between them.

To find this, take a quadrant, and apply its side to the side of a square, and apply the other side of your square to your plane: if the plumbet fall parallel to the side of the square, then the lower side of the square stands level; by which draw an horizontal line, whereon erect a perpendicular, and apply your square to that perpendicular; and if the plumbet falls parallel to the side of the square, then that is also a level line, and your plane stands horizontally: if the plumbet falls not parallel to the side of the square, then turn your square, until it does; and draw an horizontal line, on which erect a perpendicular, to which apply your square, and observe what angle your plumbet makes on the quadrant, with the side of the square: that is the angle of the *inclination of the plane*. See DECLINATOR.

INCLINATION *of two planes*, is the acute angle made by two lines drawn one in each plane, through a common point of section, and perpendicular to the same common section.

Thus, in *Tab.* III. *Geometry, fig.* 51. the *inclination* of the plane KEGL to the plane ACDB, is the angle HFI, made by the right lines HF and FI in the point F, perpendicular to the line of section EG.

INCLINATION, *angle of*, in *Optics*, is the same with what is otherwise called the *angle of* INCIDENCE.

INCLINATION, *argument of*. See ARGUMENT.

INCLINATION, in a moral sense. See APPETITE.

INCLINED *plane*, in *Mechanics*. See *Inclined* PLANE. See also MECHANICS, and MECHANICAL *powers*.

INCLINED *towers*. See TOWERS.

INCLINERS, in *Dialling*. See DIAL, and DECLINERS.

INCLOSING *of land*. See LAND.

INCOGNITO, a term borrowed from the Italians, used when a person is in any place where he would not be known; but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train, or the usual marks of their distinction and quality; or when they travel without their proper titles.

The grandees in Italy make a common custom of walking the streets *incognito*; and always take it amiss, on occasion, when people pay their compliments to them. It is not barely to prevent their being known, that they take these measures; but because they would not be treated with ceremony, nor receive the honours due to their rank.

When the horses in princes, cardinals, and ambassadors coaches have no tassels, which they call *fiocchi*, and the curtains, which they call *bandinelle*, are drawn, they are reputed to be *incognito*; and nobody that meets them is obliged to stop, or make his honours to them.

The cardinals also, when they would be *incognito*, leave off the red hat.

INCOMBUSTIBLE, that which cannot be burnt or consumed by fire.

Metals melt, stones calcine, and are yet *incombustible*. Cloth made of *lapis* AMIANTHUS has been deemed *combustible*; it is cleaned by fire, but not burnt. ASBESTOS, and LINUM *incombustibile*.

INCOMBUSTIBLE *lint*, a name given by authors to a peculiar kind of asbestos, or earth flax, which never is found into compact masses as the other species are, but always found in loose filaments, and those of a very flexible nature, and extremely fit to work.

This is a kind of asbestos, wholly different from the species known to the ancients, and is found, so far as is yet known, only in the county of Aberdeen in Scotland, in the neighbourhood of Achintore, near the Highlands. See ASBESTOS, and LINUM *incombustibile*.

The fabricating a cloth of this substance has not yet been attempted; but Mr. Wilson, who first discovered it, had some of it spun into yarn, which gives proof that the other is practicable. Phil. Trans. N° 476. p. 1005.

INCOMMENSURABLE, a term in geometry, used where two lines, when compared to each other, have no common *measure*, how small soever, that will exactly measure them both.

In

In the general, two quantities are said to be *incommensurable*, when no third quantity can be found that is an aliquot part of both; or, when those quantities are not to one another as unity to a rational number; or as one rational number to another. See COMMENSURABLE.

The side of a square is *incommensurable* to the diagonal, as is demonstrated by Euclid; but it is commensurable in power; the square of the diagonal being equal to twice the square of the side.

Pappus, lib. iv. prob. 17. speaks also of *incommensurable* angles. Surfaces which cannot be measured by a common surface, are also said to be *incommensurable* in power. See DIOPHANTINE *problems*.

INCOMPATIBLE, that which cannot subsist with another without destroying it.

Thus cold and heat are *incompatible* in the same subject; the strongest overcoming and expelling the weakest.

INCOMPATIBLE *benefices*, in *Law*, are those which cannot be retained together, if they be with cure, and of a particular value in the king's books. See CHAPLAIN.

INCOMPLEX *opposition*. See OPPOSITION.

INCOMPOSITE *numbers* are the same with what Euclid calls *prime numbers*. See PRIME and NUMBER.

INCONCINNOUS *discords*. See DISCORDS.

INCONCINNOUS *fifths*. See SYSTEM.

INCONTINENCE. Besides the moral sense of this word, it signifies in medicine an inability in any of the organs to retain what should not be discharged without the concurrence of the will. But *incontinence* is most frequently used with regard to an involuntary discharge of urine.

The bladder is sometimes so debilitated in men, that their urine flows from them involuntarily, by drops, not exceeding the usual quantity; which may proceed either from a stone in the bladder, or a palsy of the sphincter, or injuries occasioned by blows, bruises, &c. Sometimes this is the effect of a fever; and it may be likewise occasioned by a long use of strong diuretics, or of stimulating medicines, injected into the bladder. In the first case only remedy lithotomy, or an extraction of the stone: nor is lithotomy infallible; for that operation frequently occasions the disorder. But if it proceeds from a weakness in the neck of the bladder, astringent and corroborating medicines are most likely to remove or to diminish it. See DIABETES.

But as this disorder often baffles the utmost power of medicines, the surgeons have contrived instruments to retain the urine. Some recommend a leathern bag lined with pitch, to be worn in the breeches between the thighs, large enough to contain half a pint; others prefer a brass or a steel pipe, fastened to the penis, to be emptied when near full. But as these are very inconvenient, the moderns have contrived more light and easy instruments, whereby the penis and urethra are gently compressed, so as to retain the urine in the bladder, and discharge it at pleasure, by opening and shutting this light instrument, which is lined with leather, and taken from Nuck. Another still more convenient may be tightened or relaxed, according to the different size of the penis. This Heister says he has often used with success; nor was it ever before delineated by any one.

An instrument was formerly recommended by Nuck, and lately by Winslow, for this disorder; not unlike that used for ruptures. It is to be fastened round the body in the manner directed for compressing fistulas in the perinæum; so that the bolster may be fixed tight upon the perinæum. Thus, by turning a screw, the urethra may be compressed or relaxed, and the urine discharged or retained at pleasure.

An *incontinence* of urine in women frequently proceeds from a difficult labour, or from a weakness of the sphincter, by the violent extraction of a large stone; though it sometimes happens from a natural weakness or palsy, as in men. But whatever the cause may be, when it is inveterate, or proceeds from the palsy, it will neither submit to internal medicines, nor external machines.

If however it arises from the extraction of a stone, especially in girls or young women, it often goes off spontaneously, or by the external or internal use of astringents: if these fail, it is generally looked upon as incurable. Hisherus affirms, however, in a treatise upon this subject, that the best method is to introduce a pessary, or ring of a proper size, into the vagina; as for a prolapsus uteri: for the introduction of this into the vagina, under the urethra, compresses the latter so firmly, that the urine may be retained or discharged at pleasure. James. See *Incontinence of* URINE.

INCONTINENCY, in a moral sense, is of divers kinds; as in cases of bigamy, rapes, sodomy, or buggery, getting bastards; all which are punished by statute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. *Incontinency* of priests is punishable by the ordinary, by *imprisonment*, &c. 1 *Hen.* VII. cap. 4.

INCORPORATION, formed from *in*, and *corpus*, *body*, the mixing the particles of different bodies so together, as to make an uniform substance or composition of the whole, without leaving any possibility of discerning the ingredients or bodies mixed, in any of their particular qualities.

INCORPORATION, in *Law*. See CORPORATION.

INCORPOREAL, *spiritual*; a thing, or substance, which has no body. See SPIRIT, and BODY.

Thus the soul of man is *incorporeal*, and may subsist independent of the body. See SOUL.

Those ideas which are independent of bodies, can neither be corporeal themselves, nor be received within a corporeal subject: they discover to us the nature of the soul, which receives within itself what is *incorporeal*, and receives it in a corporeal manner too; whence it is, that we have *incorporeal* ideas even of bodies themselves. Penelon.

INCORPOREAL *inheritance*, in *Law*. See INHERITANCE.

INCORRUPTIBLE, that which cannot be corrupted. See CORRUPTION.

Thus spiritual substances, as angels, human souls, &c. and thus also glass, gold, mercury, &c. may be called *incorruptible*.

INCORRUPTIBLES, INCORRUPTIBILES, the name of a sect which sprang out of the Eutychians.

Their distinguishing tenet was, that the body of Jesus Christ was *incorruptible*; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he eat without any occasion, before his death, as well as after his resurrection. And hence it was that they took their name.

INCRASSATING, the act of condensing, or rendering fluids thicker, by the mixture of other less fluid particles; or by expelling the finer particles, and compressing and bringing the grosser more together.

Incrassating medicines are such as reduce the too fluid blood and juices to a proper consistence.

INCREMENT, *Incrementum*, in *Rhetoric*, a species of climax, gradually rising from the lowest to the highest. Such is that of Seneca: *Turpissima tamen est fallere, quæ per negligentiam venit: et, si vehemens attendere, magna vitæ pars elabitur nulle agentibus, maxima nihil agentibus, tota aliud agentibus.* See CLIMAX.

INCROACHMENT, in *Law*. See ACCROCHING.

INCRUSTATION, the lining or coating of a wall, either with glossy stones, rustics, marble, pottery, or stuccowork; and that either equably, or in panels and compartiments.

INCRUSTED, or INCRUSTATED *column*. See *Incrustated* COLUMN.

INCUBATION, the action of a hen, or other fowl, brooding on her eggs.

INCUBUS, *night-mare*, in *Medicine*, a disease consisting in the spasmodic contraction of the muscles of the breast, so very violent, that the patient cannot speak or even breathe.

The word is derived from the Latin *incubare*, *to lie down on any thing*, and *press it*. The Greeks called it ἐφιάλτης, q. d. *saltator*, *leaper*, or something that ruisheth on a person.

In this disease the senses are not quite lost, but they are drowned and astonished, as is also the understanding and imagination; so that the patient seems to think some huge weight thrown on him, and ready to strangle him.

Children are very liable to this distemper; so are fat people, and men of much study and application of mind; because the stomach, in all these, finds some difficulty in digestion.

The *incubus* seems to be nearly allied to the epilepsy and apoplexy; for, if it lasts long, it degenerates into one or other of those distempers. Others reckon it a kind of asthma, and call it *asthma nocturnum*; and say it proceeds from the same cause, and is helped by the same means as the common asthma.

Signs of it. The most obvious symptom of this disease is a sensation like that of some great weight laid upon the breast; this is attended with so violent a cohibition of respiration, that the person becomes unable to move any part of his body, or to utter any distinct or articulate sound; though he sometimes groans and cries out. He sometimes imagines that he is in imminent danger of various kinds, and unable to escape. This whole complaint goes off as soon as any one limb is moved, but there is often an universal lassitude of the whole body left behind it, which remains for some space of time. This disease generally attacks people in the night-time, in a sort of middle state between sleep and waking.

Persons subject to it. Those of plethoric habits are most subject

subject to fall into this diſeaſe, and among them ſuch particularly as have a great thickneſs of the blood. Perſons who are ſubject to hypochondriac complaints, and to diſorders of the ſpleen, are alſo much affected with it; and it is uſually brought on by eating large ſuppers, going to bed ſoon after, and then ſleeping upon the back. *Cauſes of it.* Theſe are a ſtagnation of the blood in plethoric habits, where it is thick about the vena portæ, which nature is endeavouring to throw off by means of thoſe ſpaſmodic motions which conſtitute this diſeaſe; and very often crudities in the prime viæ become additional cauſes, and exaſperate the complaint. Some have ſuppoſed that this diſorder proceeds from a ſtagnation of the blood in the brain, lungs, &c. but it is rather a nervous affection, and ariſes chiefly from indigeſtion. Accordingly, perſons of weak nerves, who lead a ſedentary life, and live full, are moſt commonly afflicted with it. The *cramp* is often cauſed by wind, and by any kind of mental oppreſſion.

Prognoſis in it. This is uſually eſteemed a trifling complaint, and at the utmoſt, if it does not go off of itſelf, to be cured by bleeding. Phyſicians eſteem it a diſeaſe of no danger; but it is much to be ſuſpected, that many of thoſe people who are found dead in their beds periſh by it.

Method of cure. When this diſtemper returns frequently, the method is to give gentle purges three or four times, with the digeſtive medicines, ſuch as gum ammoniacum, or the tartarum vitriolatum, on the intermediate days; after this bleeding in the foot is proper; and when this has been done, powders of nitre and cinnabar uſually complete the cure: if they fail, the common method in hypochondriac caſes is to be uſed. When there are crudities in the primæ viæ, which exaſperate this diſeaſe, then after the purges, gentle bitters, and other medicines which will reſtore the tone of the ſtomach, are to be given. Gentian and orange peel in fuſion, are very good for this purpoſe. When it happens almoſt wholly from a load on the ſtomach, a gentle vomit alone will perform a cure. To prevent returns, the patients muſt accuſtom themſelves to lie on one or the other ſide, never on the back.

Dr. Whyt recommends a glaſs of brandy at bed time, as a preventive; this however will gradually loſe its effect, and is by no means adviſable. The patient ſhould rather depend on the uſe of food of eaſy digeſtion, chearfulneſs, exerciſe in the day, and a light eaſy ſupper. Perſons who are young, and full of blood, if troubled with this diſorder, ſhould take a purge often, and uſe a ſpare diet. Junker and Buchan.

INCUMBENT, in *Law*, a Clerk reſident on his benefice, with cure.

He is ſaid *incumbent* of ſuch church, becauſe he ought to bend his whole ſtudy to diſcharge his cure. See RECTOR.

INCUMBRAVIT, in *Law*. See QUARE *incumbravit*.

INCURVATION, the act of bending a bone, or other body, from its natural ſhape.

INCURVATION *of the rays of light*. See LIGHT, and REFRACTION.

INCUS, in *Anatomy*, the ſecond of the oſſicles, or little bones of the ear.

The figure or anvil contained in the barrel of the ear, reſembles in ſome meaſure one of the anterior grinders, with its roots at a great diſtance from each other: at leaſt it comes nearer to this than to the ſhape of an anvil. Anatomiſts divide it into the body, and the branches: the body is a ſomewhat large ſubſtance; the branches or legs are two, one long and one ſhort; the body is turned forward, the ſhort leg backward, and the long leg downward. The body of the *incus* is broader than it is thick; it has two eminences, and two cavities between them, much as we ſee in the crown of the firſt grinders. The ſhort leg is thick at its origin, and from thence decreaſing gradually it ends in a point; it is ſituated horizontally, its points being turned backward, and joined to the edge of a maſſiform opening of the tympanum. The long leg viewed through the external auditory paſſage appears to be ſituated vertically; but if we look upon it either on the fore or back-ſide we ſee it is inclined, the extremity of it being turned much more inward than the root or origin. The point of the extremity is a little flatted, and bent back like a hook, and ſometimes a little hollowed like a kind of ear-picker. By this the *incus* of one ear may be diſtinguiſhed from that of the other, when out of their places; for turning the ſhort leg backward and the long leg downward, if the curvature of this long leg be toward the left hand, the bone belongs to the right ear; if toward the right it belongs to the left ear. Wiſlow. See EAR.

INDECIMABLE, *Indecimabilis*, in *Law*, is applied to things not tythable, or which by law ought not to pay TITHE.

INDEFEISIBLE, or INDEFEAZABLE, in our *Law*, ſignifies what cannot be defeated, or made void. As, a good and *indefeiſible* eſtate.

INDEFINITE, *indeterminate*, that which has no certain bounds, or to which the human mind cannot affix any. Deſcartes uſes the word, in his philoſophy, inſtead of *infinite*, both in numbers and quantities, to ſignify an *incomprehenſible* number, or number ſo great, that an unit cannot be added to it; and a quantity ſo great, as not to be capable of any addition.

Thus, he ſays, the ſtars, viſible and inviſible, are in number *indefinite*; and not, as the ancients held, *infinite*: and that quantity may be divided into an *indefinite* number of parts, not an infinite number.

INDEFINITE is alſo uſed, in the *Schools*, to ſignify a line that has but one extreme: for inſtance, a line drawn from any point, and extended infinitely.

Thus what they call *eternity a parte ante*, or *eternity a parte poſt*, are *indefinite* durations.

INDEFINITE, in *Grammar*, is underſtood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate ſenſe, and not fixed to any particular time, thing, or other circumſtance.

INDEFINITE *propoſition*, in *Logic*. See PROPOSITION.

INDELIBLE, formed from *delere*, *to blot*, with the preposition *in*, taken negatively, that which cannot be blotted out, or effaced.

Thus baptiſm, and the order of the prieſthood, are ſaid to convey *indelible* characters.

INDEMNITY, formed from the negative *in*, and *damnum*, *loſs*, in *Law*, an act by which one promiſes to guarantee, or ſave harmleſs, ſome other perſon from any loſs or damage that might accrue to him on any particular account.

When a church is appropriated to an abbey, or college, the archdeacon loſeth his induction money for ever; in recompence whereof he ſhall have yearly, out of the church ſo appropriate, one or two ſhillings, more or leſs, for a penſion, as was agreed at the time of the impropriation; and this penſion is called an *indemnity*.

INDEMNITY, with regard to eſtates. See WARRANTY.

INDEMNITY. See *Act of* GRACE.

INDENTED, INDENTE, in *Heraldry*, is when the outline of a bordure, ordinary, &c. is notched, in form of the teeth of a ſaw. *Tab.* III. *Heraldry, fig.* 69.

INDENTED *loaf*. See *Sowrard* LEAF.

INDENTED *line*, in *Fortification*. See REDENT.

INDENTED *wreſt*. See DENTED.

INDENTED *wheels and wheel*. See MEDALS and WHEEL.

INDENTURE, in *Law*, a writing which compriſes ſome contract between two, at leaſt; being indented at top anſwerable to another part, which has the ſame contents. See DEED

INDEPENDENT *company and troop*. See COMPANY and TROOP.

INDEPENDENTS, a ſect of proteſtants in England and Holland; ſo called, as denying not only any ſubordination among their clergy, but alſo all *dependency* on other aſſembly.

They maintain, that every ſeparate church, or particular congregation, has in itſelf radically and eſſentially every thing neceſſary for its own government; that it has no eccleſiaſtical power and juriſdiction; and is not at all ſubject to other churches, or their deputies, nor to their aſſemblies, or ſynods.

Robinſon, the founder of the ſect, makes expreſs uſe of this term in explaining his doctrine relating to eccleſiaſtical government: *Cœtum quemlibet particularem* (ſays he, in his Apologia, cap. V. p. 22.) *eſſe totum, integrum et perfectum eccleſiam ex ſuæ partibus conſtantem, immediate et independenter* (*quoad alias eccleſias*) *ſub ipſo Chriſto*. It may probably have been from this very paſſage that the title of *Independents* was originally derived. The principles of Robinſon, originally called BROWNISTS, from John Robinſon, the founder of this ſect, was paſtor of a congregation of Browniſts that had ſettled at Leyden, did not reject the appellation of *Independents*. it was certainly utterly unknown in England before the year 1640; at leaſt it is not once mentioned in the eccleſiaſtical canons and conſtitutions that were drawn up, during that year, in the ſynods or viſitations held by the archbiſhops of Canterbury, York, and other prelates, in which canons all the various ſects, that then ſubſiſted in England, are particularly mentioned. See Wilkins's Concilia Magnæ Britanniæ et Hiberniæ, vol. iv. cap. 5. p. 548.

It is true, that not long after this period, and more particularly from the year 1642, we find this denomination very frequently in the Engliſh annals. The Engliſh *Independents* were ſo far from being diſpleaſed with it, that they aſſumed it publicly in a piece, which they publiſhed in their own defence at London, in the year 1644, entitled,

titled, Apologetical Narration of the *Independents*. But in process of time, in order to avoid the odium of sedition and anarchy charged on this sect, the true and genuine *Independents* renounced this title, and called themselves *Congregational Brethren*, and their religious assemblies *congregational churches*. The first *Independent*, or congregational church in England, was set up in the year 1616, by Mr. Jacob, who had adopted the religious sentiments of Robinson. The *Independents*, though sprung originally from a congregation of Brownists, were much more commendable than the latter, both in the moderation of their sentiments, and the order of their discipline. The Brownists, as we have already mentioned under that article, allowed all ranks and orders of men promiscuously to teach in public, and to perform the other pastoral functions; whereas the *Independents* had, and still have, a certain number of ministers, for the most part regularly educated, chosen respectively by the congregations where they are fixed; not is any person among them permitted to speak in public, before he has submitted to a proper examination of his capacity and talents, and been approved of by the congregation to which he ministers. The charge alledged against them by our historian Rapin, (Hist. of England, vol. ii. p. 514. fol. ed.) who says, that they could not so much as endure ordinary ministers in the church, &c. is, therefore, evidently false and groundless. He was led into his mistake by confounding the *Independents* and Brownists. There are other charges, no less unjustifiable, that have been urged against the *Independents*, by this celebrated historian, and others of less note. Rapin says, that, with regard to the state, they abhorred monarchy, and approved only a republican government. This might have been true with regard to several persons among the *Independents*, in common with those of other sects; but it does not appear from any of their public writings, that republican principles formed the distinguishing characteristic of this sect. On the contrary, in a public memorial drawn up by them in 1647, they declare, that they do not disapprove of any form of civil government, but do freely acknowlege, that a kingly government, bounded by just and wholsome laws, is both allowed by God, and also a good accommodation unto men." The *Independents*, however, have been generally distinguished by the denomination of regicides; under a notion, that they were chargeable with the death of Charles I. Whether this fact be admitted or denied, and this is not a place proper for the investigation of it, no conclusion can be fairly drawn from the greater prevalence of republican principles, or from violent proceedings at that period, that can affect the distinguishing tenets and conduct of the *Independents* in general; and especially of the sect that bears this denomination in our times. It is certain, that our *Independents* are steady friends to a limited monarchy. Rapin is farther mistaken, when he represents the religious principles of the *Independents* as contrary to those of all the rest of the world. It appears from two confessions of faith, one composed by Robinson, on behalf of the English *Independents* in Holland, and published at Leyden in 1619, intitled, Apologia pro exulibus Anglis, qui Brownistæ vulgo appellantur, and another drawn up in London in the year 1658, by the principal members of this community in England, entitled, A Declaration of the Faith and Order owned and practised by the Congregational Churches in England, agreed upon and consented unto by their Elders and Messengers, in their Meeting at the Savoy, Oct. 12, 1658; as well as from other writings of the *Independents*, that they differed from the rest of the reformed in no single point of any consequence, except that of ecclesiastical government; and their religious doctrines were almost entirely the same with those that are adopted by the church of Geneva. During the administration of Cromwell, the *Independents* acquired very considerable reputation and influence; and he made use of them as a check to the ambition of the Presbyterians, who aimed at a very high degree of ecclesiastical power, and who had succeeded, soon after the elevation of Cromwell, in obtaining a parliamentary establishment of their own church government. But after the restoration of Charles II. their cause declined; and in the year 1691, under the reign of king William, they entered into an association with the Presbyterians residing in and about London, under certain heads of agreement, comprized in nine articles, that tended to the maintenance of their respective institutions. These may be found in the second volume of Whiston's Memoirs of his Life and Writings; and the substance of them in Mosheim, ubi infrà.

At this time the *Independents* and Presbyterians, called from this association the United Brethren, were agreed with regard to doctrines, being generally Calvinists, and differed only with respect to ecclesiastical discipline. But at present, though the English *Independents* and Presbyterians form two distinct parties of protestant dissenters, they are distinguished by very trifling differences with regard to church government; and the denominations are more arbitrarily used to comprehend those who differ in theological opinions. The *Independents* are generally more attached to the tenets distinguished by the term ORTHODOXY or CALVINISM, than the PRESBYTERIANS.

Independentism is peculiar to Great Britain, the British colonies of America, whither it was carried first in 1620, and by successive Puritan emigrants in 1629 and 1633, from England and the United Provinces. One Morel, in the fifteenth century, endeavoured to introduce it into France; but it was condemned at the synod of Rochel, where Beza presided, and again at the synod of Rochel, in 1644.

On the subject of this article, see Mosheim's Eccl. Hist. by Macleane, vol. iv. p. 522, &c. 800. Neal's Hist. of the Puritans, vol. ii. p. 107, &c. vol. iii. p. 547, &c. vol. iv. p. 187, &c. Burnet's Hist. of his Own Times, vol. i. p. 46, &c.

INDETERMINATE, *in Geometry*, is understood of a quantity either of time or place, which has no certain or definite bounds. See INDEFINITE.

INDETERMINATE *problem*, is that, whereof there may be infinite different solutions.

For instance, if a number be required that may be a multiple of 4 and 5; where the answer may be 20, 40, 60, &c. to infinity. Thus also, in a question of ALLIGATION, if a refiner, having three ingots of silver of different fineness, viz. of 4, 6, and 10 ounces, were required to mix a mass of 20lb weight, so as to make it 8 ounces fine; how much must he take of each sort? The best way, in this, is to determine algebraically the limits of any one of the unknown quantities: suppose them x, y, z. Then, from the premised conditions, $\frac{4x+6y+10z}{20}=8$. And $4x+6y+10z=160$. Therefore, $x=\frac{160-6y-10z}{4}=40-\frac{3y}{2}-2z$. And $y=40-\frac{2x}{3}-\frac{4z}{3}$. Consequently x less than 14.

Also, $x=20-\frac{2y}{3}-\frac{4z}{3}-2z=20-\frac{2y}{3}-\frac{10z}{3}$: therefore x greater than 10. Whence the limits of x are 14 and 10, and we shall have the following answers in whole numbers.

x	y	z
14	7	2
12	4	4
13	1	6

Or, if it were required to find two numbers whose sum together with their product may be equal to a given number, or to make a rhomboides, wherein the rectangle under the two sides may be equal to a given square; both of these problems admit of infinite solutions. See DIOPHANTINE *problems*.

INDEX, in *Anatomy*, denotes the *fore-*FINGER.

It is thus called from *indico*, *I point*, *direct*; because that finger is generally so used: whence also the extenfor indicis is called *indicator*.

The Greeks call it δειχτηρ, *licker*.

INDEX, in *Arithmetic*, is the same with what is otherwise called the characteristic, or EXPONENT of a LOGARITHM.

The *index* is that which shews of how many places the absolute number belonging to the logarithm consists, and of what nature it is, whether an integer, or a fraction.

Thus, in this logarithm 2,521203, the number standing on the left hand of the point is called the *index*; and because it is 2, it shews you that the absolute number answering to it consists of three places; for it is always one more than the *index*, because the *index* of 1 is 0; of 10 is 1; and of 100 is 2, &c. And, therefore, in those small tables of Briggs's Logarithms, where the *index* is omitted, it must be always supplied, before you can work by them.

If the absolute number be a fraction, the *index* of the logarithm has a negative sign, and is marked thus, $\overline{2},562203$; which shews the corresponding number to be a decimal fraction of three places; viz. 1,365.

Mr. Townly has a peculiar way of noting these *indices*, when they express fractions, now much in use, viz. by taking, instead of the true *index*, its arithmetical complement to 10; so that he would write the logarithm now mentioned thus: 8,562203.

How *indices* are to be added and substracted, see under the article LOGARITHM.

INDEX *of a book*, is that part annexed to a book, referring to the particular matters or passages therein contained.

INDEX *of a globe*, is a little style fitted on to the north-pole, and turning round with it, pointing to certain divisions in the hour-circle.

It is sometimes also called *gnomon*. See GLOBE.

INDEX *of relation*, in *Algebra*, the fame with fcale of relation. See SCALE.

INDEX, or INDICE, is alfo the denomination of a congregation at Rome, whofe bufinefs is to examine books, and to put fuch as they think fit to prohibit the reading and felling of, into an *index*.

Indices, or Expurgatory Indices, is the name by which the catalogues of prohibited books are called; among which, however, there is this difference, that fome are condemned purely and abfolutely, and others only *donec corrigantur*, till they be corrected.

Father Paul fays, that Philip of Spain was the firft who, by a law made in 1558, procured an *index* to be published of the books condemned by the inquifition of Spain. Pope Paul IV. took the hint, and in 1559 ordered the congregation of the holy office at Rome to print a fecond. But Gretfer, De Jure Prohib. lib. ii. cap. 19. fays, that the *index* of prohibited books was printed in Italy, by the papal authority, in 1548; and a larger one, in 1553; and another larger in 1554. Pius IV. recommended the matter to the council of Trent; the fathers at Trent, after feveral debates, not being able to agree, though fit to refer the whole affair to the pope, who, with the advice of certain learned prelates, published an *index* of the prohibited books, and certain rules, by his letters, in form of a brief. The fame Pius IV. in a bull of March 24, 1564, fays, that the *index* was prefented to him by order of the fynod, that it fhould not be published before it was approved by him. It was accordingly published by him, with a ftrict charge that it fhould be received by all, and the rules prefixed to it obferved. Clement VIII. enlarged and confirmed it, together with the rules, and commanded it to be published in 1505. This was called by the name of the Roman *Index*. By the fourth rule, the common reading of the Holy Scriptures is forbid in thefe words. "Since it is plain by experience, that if the facred writings are permitted every "where, and without difference, to be read in the vul"gar tongue, more, through their rafhnefs, will receive more harm than good; let the bifhop or inquifitor determine, with the advice of the parifh prieft or confeffor, to whom to permit the reading of the Bible, tranflated by catholic authors, in the vulgar tongue, according as they fhall judge whether it be moft likely that fuch reading the Scripture may do harm, or tend to the increafe of faith and piety. Let them alfo have the fame power as to all other writings. But if any, without fuch leave, fhall prefume to read or have them, without firft fhewing the Bible to the ordinaries, he fhall not receive the abfolution of his fins. And as to all booksellers, who fhall fell the Bible tranflated into the vulgar tongue, without fuch leave, or by any other method fhall publifh them, let them forfeit the price of the books, and let the money be given to pious ufes by the bifhops; and let them be fubject to other punifhments, at the pleafure of the faid bifhop, according to the nature of the offence. As to regulars, they "fhall not read or buy them, without leave firft obtained from their prelates." The tenth rule enjoins feveral reftrictive regulations concerning the printing and publication of books. Harduoin's Concil. tom. x. p. 207, &c.

After this, the duke of Alva procured another to be printed at Antwerp, in 1571, which was published by Francis Junius about the year 1586. There were two others published in 1584, and 1612, by the cardinals Quiroga and Sandoval, and feveral others by the inquifitors and mafters of the facred palace. The moft confiderable of all the *indices* is that of Anthony a Sotomayor, fupreme prefident and inquifitor-general in the kingdom of Spain, which was made for all the ftates fubject to the king of Spain, and comprehends all the others. This was published with the advice of the fupreme fenate of the general inquifition, in 1640, and reprinted at Geneva in 1667. To this there were many rules prefixed; and to the Geneva edition was added the *index* of the decrees which were made by the mafter of the holy palace, by virtue of his office, or by the command of the holy congregation, or by the holy congregations for the *indices* and holy office, after the before mentioned *index* of the council of Trent. The rules of the former *indices* are explained and confirmed by thefe; and the fifth rule, which enlarges the fourth of the *index* of Trent, prohibits not only all Bibles in the vulgar tongue, comprehending all except thofe that are Hebrew, Greek, Latin, Chaldee, Syriac, Ethiopic, Perfic, and Arabic; but all parts of them, either printed or manufcript, with all fummaries and abridgements in the vulgar language or tongue. Limborch's Hift. of the Inquifition by Chandler, book ii. chap. 16.

Of the operation of thefe *indices*, the authors of the Encyclopædia obferve, that there has been hardly any good book of piety or morality in their language which has not been profcribed. Art. *Index*.

INDEX *of the variation and of the inequability of curvature*. See VARIATION *of curvature*.

Eaft INDIA *Company, Coins, Silk*, &c. See COMPANY, COIN, SILK, &c.

INDIAN, in a general fenfe, denotes any thing belonging to the Indies, Eaft or Weft.

INDIAN *arrow-root*. See ARROW-*root*.

INDIAN *bread*. See CASSADA.

INDIAN *corn*. See MAIZE.

INDIAN *Creffet, Gum, Ink, Ocean, Red*. See the refpective fubftantives.

INDIAN *fig*, in *Botany*. See *Prickly* PEAR.

INDIAN *god tree*, the name of a fpecies of FIG.

INDIAN *leaf, Malabathrum*. See TAMALAPATRA.

INDIAN *reed*. See CANE and REED.

INDIAN *wood*, called alfo *Jamaica* and *Campeachy Wood*, is taken out of the heart of a large tree growing plentifully in the ifles of Jamaica, Campeachy, &c. which in dying, its decoction being very red.

It has been obferved, that putting fome of this decoction into two bottles, and mixing a little powder of alum with the one, it will become of a very beautiful red, which will hold; the other in a day's time becoming yellow, though both bottles were ftopped from the air alike; and that if a little of the fame decoction be expofed to the air, it will become as black as ink in the fame fpace of time. See CAMPEACHY *wood*, BRAZIL, and LOGWOOD.

INDICATION, in *Phyfic*, fignifies the pointing out or difcovering what is fit to be done, and what means applied in any cafe, from a knowledge of the nature of the difeafe, and the virtue of medicines.

Indications are of four kinds; *profervative*, or *prophylactic*, which direct how to cut off the caufe of an approaching difeafe; *curative*, which fhew how to remove a difeafe actually formed; *palliative*, which direct how to leffen its effects, or take off fome of its fymptoms, before it can be wholly removed; and *vital*, which relate to the ftrength of the body.

That part of phyfic which treats of *indications* is called REMEDIOTICA.

INDICATIVE, in *Grammar*, the firft mood or manner of conjugating verbs, fhewing either the time prefent, paft, or future, and aferting what we think certain; and, therefore, fometimes called the *declarative* mood.

I love, is the prefent tenfe; *I loved*, the paft; and *I will love*, is the future of the *indicative* MOOD.

INDICATIVE *column*. See COLUMN.

INDICATOR, in *Anatomy*, a mufcle of the INDEX, or finger, next following the thumb.

The *indicator* is the firft proper mufcle of the index; and is fo called, becaufe it ferves to extend that finger to point at any thing.

It has its origin in the middle and hind part of the cubitus, and is inferted by a double tendon into the fecond phalanx of the index, and to the tendon of the great extenfor, with which it acts in conjunction in ftretching out the finger. See *Tab. Anat. (Mufc.) fig.* 7. *n.* 10. 49. See EXTENSOR.

INDICAVIT, in *Law*, a writ or prohibition that lies for a patron of a church, whofe clerk is fued in the fpiritual court by another clerk for tythes, which do amount to a fourth part of the profits of the advowfon; then the fuit belongs to the king's court, by the ftat. Weft. 2. cap. 5. And the patron of the defendant being likely to be prejudiced in his church and advowfon, if the plaintiff recovers in the fpiritual court, hath this means to remove it to the king's court. Reg. Orig. 35. Old Nat. Br. 31.

INDICTION, fignifies the convoking of an eccleſiaſtical aſſembly; as a fynod, or council, or even a diet.

INDICTION is applied to the feveral feſſions of the general councils.

Hence it is, that at the end of the feſſions of the council of Trent, the decree by which the council appoints the day of the future ſeſſion, is called the *indiction* of that ſeſſion.

INDICTION, in *Chronology*, a term uſed for a kind of epocha, or manner of counting time among the Romans; containing a cycle or revolution of fifteen years, which, when expired, begins anew, and goes round again without intermiſſion.

This method of computation has no dependence on the heavenly motions. Petavius ſays, there is nothing in chronology leſs known than the Roman *indiction*; he means, than its original and commencement. It is the general opinion, that it was inſtituted in the time of Conſtantine, about the year 312; but this is a mere gueſs. There were *indictions* in the time of the emperor Conſtantius, as appears from the Theodoſian Code. The learned hold, that *indictions* were originally no other than certain

certain annual taxes, the tariffs whereof were published every year; but why they were so called, why confined to a cycle of fifteen years, when, and on what occasion, instituted, is not known.

We find three kinds of *indictions* mentioned in authors; the *indiction* of Constantinople, beginning on the first of September; the Imperial, or Cæsarean *indiction*, on the fourteenth of September; and the Roman or papal *indiction*, which is that used in the pope's bulls, and which begins on the first of January.

The popes have dated their acts by the year of the *indiction*, which was fixed to the first of January, A. D. 313, ever since Charlemagne made them sovereign; before which time they dated them by the years of the emperors.

At the time of the reformation of the calendar, the year 1582 was reckoned the tenth year of the *indiction*; so that beginning to reckon hence, and dividing the number of years elapsed between that time and this by 15, the remainder, with the addition of 10, will be the year of *indiction*, corresponding to the year of our Lord 1780. The *indiction* may also be found by adding 3 to the year of our Lord, and dividing the sum by 15, the remainder is then the year of the *indiction*: if there be no remainder the *indiction* is 15. In either of these ways the year of *indiction* for 1780 is 13.

The word *indiction* comes from *indictio*, which signifies *establishment*, *order*, or *denunciation*. The time of the *indiction*, among the Romans, was that wherein the people were summoned to pay a certain tribute; and it is for this reason, that the imperial *indiction* began towards the end of September; because the harvest being then got in, it was supposed the people could more easily pay their tax.

INDICTIVE, INDICTIVUS, an epithet given to certain feast-days appointed by the Roman magistrates, viz. the consuls, or prætor.

INDICTMENT, derived from the French *endite*, *indicare*, or, according to M. Lambard, from *ostendere*, *I charge*, *I inform against*, in *Law*, a bill or declaration, of complaint, drawn up in form of law, for the benefit of the commonwealth: exhibited as an accusation of one for some offence, criminal or penal, and preferred to a grand jury, and by their verdict found to be true, and presented before a judge or officer, who has power to punish or certify the same offence.

INDICTMENT, in *Common Law*, signifies as much as *accusatio* among the civilians; though in some points it differs. See ACCUSATION.

Lambard says, an *indictment* is an accusation at the suit of the king, by the oaths of twelve men of the same county where the offence was committed; returned to inquire of all offences in general in the county, determinable by the court into which they are returned, and their finding a bill brought before them to be true. But when such accusation is found by a grand jury, without any bill brought before them, and afterward reduced to a formed *indictment*, it is called a presentment; and when it is found by jurors returned to enquire of that particular offence only, which is indicted, it is properly called an inquisition.

Although a bill of *indictment* may be preferred to a grand jury upon oath, they are not bound to find the bill, if they find cause to the contrary; and though a bill of *indictment* be brought to them without oath made, they may find the bill if they see cause. But it is not usual to prefer a bill unto them, before oath be first made in court, that the evidence they are to give unto the grand inquest to prove the bill, is true.

The grand JURY are to find the whole of a bill, or to reject it; and not to find it specially in part, &c. if they are satisfied of the truth of the accusation, they them indorse upon the bill of *indictment* "a true bill," anciently, BILLA vera. But to find a bill, there must at least twelve of the jury agree. The *indictment*, when so found, is publicly delivered into court.

As *indictments* are purely for the good and quiet of the commonwealth, they are to be preferred for criminal, not civil matters. They are used in cases of high treason, and petit treason, felony, and trespasses of all kinds, and in all pleas of the crown; though they cannot be used for injuries of a private nature, that neither concern the king nor the public; and therefore all *indictments* ought to be brought for offences committed against the common law, or against statutes; and not for every slight misdemeanor. A person cannot be *indicted* of suspicion of felony, but of the very crime itself; and then if he be not in custody, the sheriff is commanded to attach his body by a capias, &c. A person *indicted* for felony may have counsel allowed to speak for him, as to matter of law only; but such as are *indicted* for treason may have a copy of their *indictment* before trial, in order to advise with counsel; and such *indictments* are to be found within three years after the offence committed, unless the treason be *directly* against the king's person. 7 & 8 W. III. cap. 3. which is extended to trials on impeachments by 20 Geo. II. cap. 30. Persons *indicted* of treason must be by the oaths of two witnesses; but in other cases one witness is sufficient. The prisoner, in this case, shall also have a copy of the *indictment*, but not the names of the witnesses, five days at least before the trial, i. e. upon the true construction of the act 7 W. III. cap. 3. before his arraignment; he shall also have a copy of the panel of jurors two days before his trial; and he shall have the same compulsive process to bring in his witnesses for him, as was usual to compel their appearance against him. By 7 Ann cap. 21. every person *indicted* for high treason or misprision of treason, shall have not only a copy of the *indictment*, but a list of all the witnesses to be produced, and of the jurors impannelled, with their professions and places of abode, delivered to him ten days before the trial, and in the presence of two witnesses. But this last act, so far as it affected *indictments* for the inferior species of high treason, respecting the coin and royal seals, is repealed by the statute 6 Geo. III. cap. 53. But no person *indicted* for felony is, or (as the law stands) can be, entitled to such copies, before the time of his trial.

Indictments must be certain in every point, and charge some particular offence: also goods stolen must be particularly set down, and the offence laid positively, and not by way of recital. There must also be expressed the Christian name, surname, and addition of the offender, with the day, year, and place in which the offence was committed, as also the nature of the offence. 1 Hen. V. cap. 5. In an *indictment* for murder, the length, depth, or other dimension of the wound, must be expressed, that a judgment may be formed whether it was mortal; and in this case, the time of the death must be laid within a year and a day after the mortal stroke was given. See APPEAL.

And in felony, the value of the things stolen it is to be particularly mentioned, in order that it may appear whether the offender has been guilty of grand or petit larceny. A mistake in spelling the defendant's surname is not a sufficient cause for abating the *indictment*, provided it sounds like it. If a word of consequence be omitted in an *indictment*, it renders the whole naught; but the case is not the same, where a word of form is omitted, or where there is an omission of a synonymous word, if the sense is not injured. In case one part of an *indictment* is inconsistent with another part of it, the *indictment* becomes void; though where the sense is plain, the court will dispense with a small inconsistency. *Indictments* are amendable the same term they are brought into court, but not afterwards; and in criminal prosecutions, the amendment must be only such as is permitted by the common law. *Indictments* for crimes committed, ought to be laid in the county where they were done; for otherwise, upon pleading the general issue, nor guilty, if it appears that the offence was committed in another county or place different from that in the *indictment*, the defendant will be acquitted. An offender is subject to *indictment* for a felony committed against a person unknown; yet some body must be proved to be the proprietor upon the trial, or else the property will be presumed to be in the prisoner, he having pleaded not guilty. An *indictment* being at the king's suit, the prosecutor is a good witness to prove the charge contained in it; and no damage can be given to the party aggrieved, except it be particularly grounded on some statute. *Indictments* before justices of the peace may be removed by certiorari into the king's bench.

A bill of *indictment* is said to be an accusation, because the jury, who inquire of the offence, do not receive it till the party that offered the bill, appearing, subscribes his name, and offers his oath for the truth of it.

It is always at the suit of the king, and differs from an *accusation* in this, that the preferrer is no way tied to the proof thereof upon any penalty, if it be not proved, except there appear a conspiracy. But if any one prefer an *indictment* to the grand jury for any criminal offence, without probable cause, and the bill is not found, or the party is acquitted, action lies for a malicious prosecution. In order to which it is necessary that the plaintiff should obtain a copy of the record of his *indictment* and acquittal; but, in prosecutions for felony, it is usual to deny a copy of the *indictment*, where there is any the least probable cause to found such prosecution upon. But an action for a malicious prosecution may be founded on such an *indictment* whereon no acquittal can be; as if it be rejected by the grand jury, or be *coram non judice*, or be insufficiently drawn.

INDICTMENT, *demurrer to*. See DEMURRER.

INDICTOR, in *Law*, he that indicteth another for an offence;

fence; and *indictee* is the party who is indicted. 1 Ed. III. cap. 11. 21 Jac. I. cap. 8.

INDICUM. In the writings of the ancients we find this word very frequently used, as the name of a blue colour, or pigment, used in dying, and imported to Rome, Greece, and other parts of the world, from the East Indies. The greater number of writers make this the same with our indigo, or *anil* fecula; and some say it was the same with our woad; but the former opinion seems most probable.

This substance, which the Greeks call *indicum*, the Arabian writers, Avicenna, Serapion, and others, have called *nil*; though the same word is also sometimes used by them for the pigment made from woad.

INDICUM *fulsum*. See FOLIUM and TAMALAPATRA.

INDICUS *excelsus*. See COCCULUS.

INDICUS *color*, a term used by several of the ancient writers to express black. The generality of the Greek and Roman physicians of old times have called the black lignum aloes, *agallochum indicum*; and the only black kind of myrobalan they were acquainted with, was in the same manner called the *indicum*; not that these were supposed peculiarly the product of the Indies, in distinction from the paler lignum aloes, or the other myrobalan; but that they were of that colour which they called *indicus color*.

INDICUS *cortex*. See COSTUS.

INDIGENOUS, of *indigena*, denotes a native of a country; or that which was originally born or produced in the country where it is found. In this sense, particular species of animals and plants are said to be *indigenous* in the country where they are native, in opposition to EXOTIC.

INDIGESTION, a crudity, or want of due coction, either in a food, a humour of the body, or an excrement.

In the system of trituration, *indigestion*, which is a crudity, may be very naturally accounted for, from the relaxation of the fibres of the stomach. A bilious *indigestion*, in the opinion of Hecquet, a great advocate for trituration, is owing to too much force in the stomach, or too much vivacity in its oscillations, which spoil the digestion, by rendering the trituration imperfect. But this is hardly satisfactory: for it should seem that digestion would be the more perfect, in proportion as the force of the stomach is increased. See DIGESTION, and TRITURATION.

INDIGETES, a name which the ancients gave to some of their gods.

There are various opinions about the origin and signification of this word; some pretending, it was given to all the gods in general; and others, only to the semi-gods, or great men deified. Others say, it was given to such gods as were originally of the country, or rather such as were the gods of the country that bore this name; and others again hold, it was ascribed to such gods as were patrons and protectors of particular cities.

Lastly, others hold *indigetes* to be derived from *inde genitus*, or *in loco degens*, or from *inde* and *ago*, for *ego, I live, I inhabit*; which last opinion seems the most probable.

In effect it appears, 1. That these *indigetes* were also called *local gods*, *dii locales*, or *topical gods*, which is the same thing. 2. The *indigetes* were ordinarily men deified, who indeed were, in effect, local gods, being esteemed the protectors of those places where they were deified; so that the second and third opinion are very consistent. 3. Virgil joins *patrii* with *indigetes*, as being the same thing. Georg. I. ver. 498. *Dii patrii, indigetes.* 4. The gods to whom the Romans gave the name *indigetes* were, Faunus, Vesta, Æneas, Romulus, all the gods of Italy; and at Athens, Minerva; says Servius; and at Carthage, Dido. It is true, we meet with Jupiter *indiges*; but that Jupiter *indiges* is Æneas, not the great Jupiter; as we may see in Livy, lib. i. cap. 3. in which last sense Servius allures us, *indiges* comes from the Latin *in dies ago, I am among the gods.*

Among these *indigetes* gods, there is none more celebrated, nor more extensively worshipped, than Hercules.

INDIGNATORIUS, a muscle thus called, as being supposed to draw the eye from its inner corner outwards, which gives an appearance of scorn and anger.

But this is properly a compound motion of two muscles; for which, see EYE.

This muscle is called by others the *rectus exterior*, and *obductor*; and by Albinus, the ABDUCTOR. It is one of his *quatuor recti oculi*.

INDIGO, *Anil*, or *Indigofera*, in *Botany*, a genus of the *diadelphia decandria* class. Its characters are these: the flower is of the butterfly kind: the standard open, bordered, and reflexed; the wings are oblong, blunt, and spread open, as is also the keel, which turns backward; in the centre is situated a cylindrical germen, which becomes a taper pod, filled with kidney-shaped seeds. Miller enumerates five species, and Linnæus six.

The species commonly cultivated for use is the Guatimala *indigo*, with smooth arched pods, growing close to the branches, unequal winged leaves, whose lobes are blunt and oval. This is chiefly cultivated in the English plantations in America, and by the French; though the Jamaica wild *indigo*, and the Carolina *indigo*, have been used with advantage.

From this plant is extracted a dyer's drug, of a deep blue colour, brought hither from the West Indies and America. It is also made in the East Indies, particularly in the dominions of the Great Mogul, the kingdom of Golconda, &c.

Labat has given a particular account of the culture of the plant, and the preparation of the *indigo*. The ground being thoroughly cleared from weeds (one of the principal points in the culture) a number of slaves, ranged in a line, march across, making little trenches of the width of their hoes, and two or three inches deep, about a foot distance from one another every way: then, returning, they drop some seeds in each trench, and afterwards cover them with the earth taken out. In moist weather, the plant comes up in three or four days; and in about two months after, it is fit for cutting: if suffered to stand till it runs into flower, the leaves become too dry and hard, and the *indigo* obtained from them proves less in quantity, and less beautiful: the due point of maturity is known, by the leaves beginning to grow less supple, or more brittle. In rainy seasons, the cutting may be repeated every six weeks: cutting in dry weather kills the plant, which, if that is avoided, continues to afford fresh crops for two years.

A large quantity of the herb is put into a vat or cistern of strong mason work, with so much water as is sufficient to cover it; and some wood laid above, to prevent its rising up. The matter begins to ferment, sooner or later, according to the warmth of the weather, and the maturity of the plant, sometimes in six or eight hours, and sometimes not in less than twenty. The liquor grows hot, throws up a plentiful froth, thickens by degrees, and acquires a blue colour inclining to violet. At this time, without touching the herb, the liquor impregnated with its tincture is let out, by cocks in the bottom, into another vat placed for that purpose, so as to be commanded by the first.

In the second vat, the liquor is strongly and incessantly beat and agitated, with a kind of buckets fixed to poles, till the colouring matter is united into a body. A good deal of nicety is requisite in hitting this point: if the beating is ceased too soon, a part of the tinging matter remains dissolved in the liquor: if continued a little too long, a part of that which had separated is dissolved afresh. The exact time for discontinuing the process is determined, by taking up some of the liquor occasionally in a little cup, and observing whether the blue fecula is disposed to separate and subside.

The whole being now suffered to rest till the blue matter has settled, the clear water is let off, by cocks in the sides at different heights; and the blue part discharged by a cock in the bottom, into another vat. Here it is suffered to settle for some time longer, then farther drained in cloth bags, and exposed in shallow wooden boxes to the air, without exposing it to the sun, and carefully keeping it from the rain, till thoroughly dry.

The author above mentioned, from whom the whole of the foregoing account is extracted, observes farther, that the goodness of the *indigo* depends greatly upon the age of the plant; that before it has grown fully ripe, the quantity it yields is less, but the colour proportionably more beautiful; that probably the secret of those who sell *indigo* has been most esteemed, is no other than cutting the herb at the time when it yields the finest colour; that the superiority of some of the *indigos* of the East Indies to those of America, is perhaps owing to the former being prepared more curiously from only the leaves of the plant; and that by beating the herb in the steeping-vat, which has been practised by some with a view to increase the quantity, great part of the substance of the leaves and bark is blended with the water along with the colouring matter, and the *indigo* extremely debased.

It is said that lime, or lime-water is sometimes employed in the beating-vat, to promote the separation of the tinging particles from the water; and that the hardness or finiteness of some sorts of *indigo* is owing to an over proportion of this addition.

Pomet says, that the Indians of the village of Sarqueffe, near Amadabat, use only the leaves of the *indigo*, and throw away the plant and branches; and from thence the most esteemed *indigo* is brought.

Indigo is commonly divided, from the colour which it exhibits upon breaking, into three kinds, copper-coloured, purple, and blue. It is said that the dyers use chiefly the first; and the callico-printers (for this drug gives a durable stain to linen as well as woollen) the last. On what particular

particular circumſtances theſe different appearances depend, we know not; nor is it certainly known, whether the real quality of the *indigo* has any connexion with them. The deepeſt and livelieſt blue *indigo*, rubbed with the nail, appears like poliſhed copper; and ſolutions of all the ſorts, made in alcaline lixivia, aſſume alike a copper-coloured ſkin upon the ſurface.

Good *indigo* is moderately light, breaks of a ſhining ſurface, and burns almoſt wholly away upon a red-hot iron. It is quickly penetrated by water, and reduced into a kind of paſte; a conſiderable part is at the ſame time diffuſed through the liquor, and very ſlowly ſubſides. This is probably what Labat and Hellot mean by its diſſolving in water; for no part of the *indigo* really diſſolves; it cannot indeed be expected that it ſhould, from the proceſs by which it is obtained.

Indigo requires an equal quantity or more of fixed alcaline ſalt, to render it totally ſoluble in water. On digeſting the *indigo*, with a gentle heat, in the ſolution of the alcaline ſalt, a ſhining copper-coloured ſkin begins to appear, and gradually covers the whole ſurface: on agitating the matter, a large blue flower or froth ariſes, and the liquor underneath appears of a deep green. If woollen cloth, without any other preparation than moiſtening it with warm water, be dipt in this hot liquor, it comes out perfectly green, and changes almoſt inſtantly in the air to a fine blue. This is the common proceſs of dying blue.

Mr. Hellot deſcribes two *indigo* vats with urine; one of which is uſed hot like the foregoing, and the other cold. The *hot vat* conſiſts of equal parts of *indigo*, alum, and tartar, digeſted in urine till the liquor becomes green. The cold one is prepared, by digeſting powdered *indigo* with vinegar for twenty-four hours, in the proportion of four pounds to about three quarts; then mixing the matter with about fifty gallons of urine, and ſtirring the whole together every night and morning, till the liquor turns green, and gathers a head like the common vat.

Indigo is fitted for printing on linen, by diluting it with water into the conſiſtence of a ſyrup; then adding ſome powdered pearl-aſhes, green vitriol, and lime newly ſlaked; to much water, occaſionally, as will reduce them into the conſiſtence of thin paint; mixing the whole thoroughly together, and ſtirring the matter every now and then, till it gains a copper colour on the ſurface. The proportions uſed by the workmen are, two parts of *indigo*, one of pearl-aſhes, three of vitriol, and two of lime. The ſame compoſition, diluted with a ſufficient quantity of water (about ſix gallons to a pound of *indigo*) and boiled, gives a durable blue to tanned ſkins, whether dipt in hot or cold.

Indigo digeſted in a moderate heat with different volatile alcaline ſpirits, gave only yelloviſh and browniſh red tinctures: with rectified ſpirit of wine, a reddiſh one; to lime-water, and to water acidulated with the vitriolic, nitrous, and marine acids, it gave no tincture at all.

The concentrated vitriolic acid unites with it into a ſmooth paſte, eſpecially if the *indigo* is previouſly well ground with powdered glaſs, ſand, or other like ſubſtances. The *indigo* is thus rendered ſoluble in boiling water along with the acid, ſo as to paſs through the pores of a filter; the ſolution, whilſt hot, appears of a deep bright green colour, like that made by fixed alcalies, but fades as it grows cold, and changes at laſt to a browniſh. Theſe experiments, which were many times repeated with the ſame event, ſeem to overturn Mr. Hellot's ingenious theory; which deduces the green colour of ſolutions of *indigo* from the common property of blue juices being turned green by alcalies; and the blue colour which the cloth acquires ſoon after it is taken out of the vat, from a ſeparation of the alcali. We here find, that a green ſolution of this concrete is obtainable by the ſtrongeſt of the acids, and that with volatile alcalies it diſcovers no tendency to greenneſs.

For the method of preparing *Saxon* BLUE and *Saxon* GREEN from *indigo*, ſee thoſe articles.

Indigo is ſometimes uſed among the painters, for paper-hangings, and ſuch groſs uſes, who grind and mix it with white to make a blue colour; for without that mixture it would paint blackiſh.

They alſo mix it with yellow, to make a green colour. It is alſo uſed in dying, and by the laundreſſes, to give a bluiſh caſt to their linen.

In the Hortus Indus Malabaricus is an account of the plant whence *indigo* is drawn; the decoction of whoſe root is ſaid to be excellent againſt nephritic colics; its leaves, applied to the abdomen, good to promote urine; and the *indigo* itſelf is ſaid to be of good uſe in drying of tumors.

Some phyſicians have recommended *indigo* in the quantity of a dram, while others look upon it as a poiſon; and in Saxony the internal uſe of it is prohibited.

INDIGO, *baſtard*. See AMORPHA.

INDIRECT *modes of ſyllogiſms*, in *Logic*, are the five laſt modes, or MOODS, of the firſt figure, expreſſed by the barbarous words *baralipton, celantes, dabitis, fapeſmo, freſiſon*.

It is the converſion of the concluſion which renders the *modes indirect*: for inſtance, a ſyllogiſm in darii, and another in dabitis, would be perfectly alike, were it not for that converſion; the propoſitions having the ſame quantity, and the ſame quality, and the middle term being the ſubject in the major, and the attribute in the minor, in both. It remains then, that, to make a diſtinction, that which is the ſubject of the concluſion in darii, be the attribute in the concluſion of dabitis; and that which is the attribute in the firſt, the ſubject in the laſt. See SYLLOGISM.

DA- Every thing that promotes ſalvation is advantageous:
RI- They are afflictions which promote ſalvation:
1. Therefore there are afflictions which are advantageous.

DA- Every thing that promotes ſalvation is advantageous:
BI- There are afflictions which promote ſalvation:
TIS. Therefore ſome things promoting ſalvation are afflictions.

INDIRECT *confirmation*. See CONFIRMATION.

INDISCERNIBLES, in the *Philoſophy of Leibnitz*. See LEIBNITZIAN *philoſophy*.

INDIVIDUAL, INDIVIDUUM, in *Logic*, a particular being of any ſpecies; or that which cannot be divided into two or more beings, equal or alike.

The uſual diviſion in logic is made into genera or genuſes, thoſe genera into ſpecies, and thoſe ſpecies into *individuals*. See GENUS, SPECIES, and DIVISION.

The ſchoolmen make a fourfold diſtinction of *individuals*; viz.

INDIVIDUUM *vagum*, that, which though it ſignifies but one thing, yet may be any of that kind: as when we ſay a man, a certain perſon, or one, ſaid ſo and ſo; though but one perſon is meant, yet that perſon, for aught that appears to the contrary, may be any body.

INDIVIDUUM *determinatum* is, when the thing is named and determined; as Alexander, the river Nile, &c. this is alſo called *individuum ſignatum*.

INDIVIDUUM *demonſtrativum* is, when ſome demonſtrative pronoun is uſed in the expreſſion; as, this man, that woman.

INDIVIDUUM *in hypotheſi*, or by ſuppoſition, when an univerſal name or term is reſtrained, by the ſuppoſition, to a particular thing: as when we ſay, the ſon of ſuch a one, and it be known that he had but one ſon.

INDIVISIBLES, in *Geometry*, thoſe indefinitely ſmall elements, or principles, into which any body or figure may be ultimately reſolved.

A line is ſaid to conſiſt of points, a ſurface of parallel lines, and a ſolid of parallel and ſimilar ſurfaces; and becauſe each of theſe elements is ſuppoſed *indiviſible*, if in any figure a line be drawn through the elements perpendicularly, the number of points in that line will be the ſame as the number of the elements.

Whence it appears, that a parallelogram, priſm, or cylinder, is reſolvable into elements, as *indiviſibles*, all equal to each other, parallel, and like to the baſe; and a triangle into lines parallel to the baſe, but decreaſing in arithmetical proportion; ſo alſo are the circles, which conſtitute the parabolic conoid, and thoſe which conſtitute the plane of a circle, or the ſurface of an iſoſceles cone.

A cylinder may be reſolved into cylindrical curve ſurfaces, having all the ſame height, and continually decreaſing inwards, as the circles of the baſe do, on which they inſiſt. This way of conſidering magnitudes, is called the method of *indiviſibles*, which is only the ancient method of exhauſtions, a little diſguiſed and contracted.

It is found of good uſe in ſhortening mathematical demonſtrations; of which we may give an inſtance in that famous propoſition of Archimedes, that a ſphere is two thirds of a cylinder circumſcribing it.

Suppoſe a cylinder, an hemiſphere, and an inverted cone (*Tab.* III. *Geometry, fig.* 52.) to have the ſame baſe and altitude, and to be cut by infinite planes all parallel to the baſe, of which *d g* is one; it is plain, the ſquare of *d b* will every where be equal to the ſquare of *k e* (the radius of the ſphere) the ſquare *b e=e b* ſquare; and, conſequently, ſince circles are to one another as the ſquares of the radii, all the circles of the hemiſphere will be equal to all thoſe of the cylinder, deducting thence all thoſe of the cone; wherefore the cylinder, deducting the cone, is equal to the hemiſphere; but it is known, that the cone is one third of the cylinder, and conſequently the ſphere muſt be two thirds of it.

Cavalleri was the firſt perſon who introduced this method of *indiviſibles* into one of his works, entitled Geometria Indiviſibilium, printed in 1635; which he alſo made uſe of in another tract publiſhed in 1647.

INDIVISO.—*Pro* INDIVISO. See PRO.

INDIVISUM *feudum*. See LEAF.

INDOCTORUM *parliamentum*. See PARLIAMENTUM.

INDORSEMENT, any thing written on the back of a deed, or inſtrument. See ENDORSING.

A condition written on the back of an obligation is commonly called an *indorſement*: from *in*, and *dorſum*, *back*.

INDORSEMENT *of a bill of Exchange*. See ENDORSEMENT.

INDUCEMENT, in *Law*, is what is alledged as a motive or incitement to a thing; and it is uſed ſpecially in ſeveral caſes: viz. there is *inducement* to actions, to a traverſe in pleading, a fact or offence committed, &c. *Inducements* to actions need not have ſo much certainty as in other caſes: a general *indebitatus* is not ſufficient, where it is the ground of the action; but where it is only the *inducement* to the action, as in conſideration of forbearing a debt until ſuch a day (for that the parties are agreed upon the debt) this being but a collateral promiſe is good without ſhewing how due.

INDUCIARUM *petitio*. See PETITIO, and EMPARLANCE.

INDUCTION, in *Logic* and *Rhetoric*, a conſequence drawn from ſeveral propoſitions, or principles, firſt laid down.

Thus, the concluſion of a ſyllogiſm is an *induction* made from the premiſes. See SYLLOGISM.

INDUCTION is alſo uſed for a kind of ſyllogiſm itſelf; being a medium between an ENTHYMEME and a GRADATION, in regard it wants a propoſition (which, however, is underſtood), as in the enthymeme; and abounds in aſſumptions (which yet are collateral, or of the ſame degree), which is the caſe in a gradation.

For inſtance; every terreſtrial animal lives, every aerial animal lives, every aquatic animal lives, and every reptile animal alſo lives; therefore every animal lives.

Here, it may be obſerved, are various aſſumptions, from the more general ſpecies of the animal kind collected into one; which this propoſition is ſuppoſed to precede; e. g. that every animal is either terreſtrial, aerial, aquatic, or reptile.

Suidas reckons three kinds of *induction*: that juſt mentioned, which concludes or infers ſome general propoſition upon an enumeration of all the particulars of a kind he calls the *dialectic induction*.

The ſecond proceeds by interrogation, and concludes probably, or with a veriſimilitude; this is what the Greeks called καθ' ὑφοχήν, and was that which Socrates ordinarily made uſe of, as Cicero, in his Topics, and Quintilian have obſerved: and, therefore, called the *Socratic induction*. This, however, is a captious way of reaſoning; for while the reſpondent is not aware of what is deſigned to be inferred, he is eaſily induced to make thoſe conceſſions, which otherwiſe he would not. Beſides, it is not ſo well ſuited to continued as to interlocutory diſcourſes.

The third kind of *induction* is properly rhetorical; being a concluſion drawn from ſome example, or authority.

This is a very imperfect *induction*, all its force lying in a propoſition which is concealed, and which will hardly bear being expreſſed. Thus, he that ſays, Codrus died bravely for his country, therefore I muſt die bravely for my country; proves nothing, unleſs this propoſition be carried in mind, that I muſt do the ſame with Codrus. Again, Archimedes, and the other mathematicians, ſay, the ſun is much bigger than the earth; therefore, it muſt be owned, the ſun is much bigger than the earth. Where this propoſition is underſtood, viz. whatever Archimedes, and the other mathematicians, ſay, is true.

Induction is one of the four forms of reaſoning uſed by orators in CONFIRMATION; the other three are SYLLOGISM, ENTHYMEME, and EXAMPLE, which laſt coincides with the third ſpecies of *induction* above enumerated.

INDUCTION, in the *Engliſh Laws*, is uſually taken for the giving poſſeſſion to an incumbent of his church, by leading him into it, and delivering him the keys, by the commiſſary, or biſhop's deputy, and by his ringing one of the bells.

When a clerk is inſtituted *into* a benefice, he is to exhibit his mandate from the biſhop to the archdeacon, or other perſon to whom it is directed, and hath a right thereby to be *inducted* into his living; and if he be refuſed *induction*, he hath a remedy both in the eccleſiaſtical court, and alſo an action of the caſe in common law, againſt the archdeacon. If the *inductor*, or perſon to be *inducted*, be kept out of the church, or houſe, by laymen, the writ *de vi laica* lies for the clerk, which is directed out of the chancery to the ſheriff of the county, to remove the force, &c. If another clergyman, preſented by the ſame patron, keep poſſeſſion, a ſpoliation is grantable out of the ſpiritual court, whereby the tythes, &c. ſhall be ſequeſtered, till the right be determined.

The archdeacon rarely *inducts* a clerk in perſon, but uſually iſſues out a warrant to the clerks and lettered perſons within the archdeaconry, impowering any of them to do it in his ſtead.

An *induction* made by the patron of the church is void: but biſhops and archdeacons may *induct* a clerk to the benefices of which they are patrons, by preſcription. No *induction* is neceſſary to a donative, where the patron, by donation in writing, puts the clerk in poſſeſſion without preſentation. 11 Rich. IV. cap. 7.

The uſual form and manner of *induction* is, for the *inductor* to take the clerk by the hand, and then to lay it on the key of the church, which muſt be then in the door, and to ſay, "By virtue of this inſtrument, I *induct* "you into the real, actual, and corporal poſſeſſion of "the rectory or vicarage of ——, with all its fruits, pro"fits, members, and appurtenances."—This done, he opens the door, and puts the clerk in poſſeſſion of the church, and ſhuts the door upon him; who, after he hath a while rung all (if there be any) to give the pariſhioners due notice and ſufficient certainty of their new miniſter, comes out, and delires the *inductor* to indorſe a certificate of his *induction* on the archdeacon's warrant, and that all preſent will ſignify it under their hands. If the church-key cannot be had, it is ſufficient that the clerk lays hold of the ring of the door, the latch of the church gate, &c. and, within two months after this, the clerk muſt read the thirty-nine articles, and all the ſervice of the day, both at morning and evening-prayers, in the pariſh church of his benefice, and in the time of common prayer, and declare his aſſent and conſent; he muſt alſo then read the ordinary's certificate, in which is the declaration of his conformity, together with the ſame declaration, and of all this he muſt have two or three good witneſſes, who muſt ſign that they heard him do it, and be ready to atteſt it, *viva voce*, if required; and, within ſix months after *induction*, he muſt alſo take the oaths of allegiance, ſupremacy, and abjuration, at the quarter-ſeſſions, or in ſome one of the courts at Weſtminſter-hall.

Induction makes the parſon complete incumbent, and fixes the freehold in him. When a clerk is thus preſented, inſtituted, and *inducted* into a rectory, he is then, and not before, called in law *perſona impersonata*, or parſon impariſonee. 13 Eliz. c. 12, 13 and 14 C. II. c. 4. 1 Geo. ſtat. ii. c. 13. 9 Geo. II. c. 26. 23 Geo. II. c. 28.

INDULGENCE, in the *Romiſh Theology*, the remiſſion of a puniſhment due to a ſin, granted by the church, and ſuppoſed to ſave the ſinner from purgatory.

The Romaniſts found their *indulgences* on the infinite treaſure of the merits of Jeſus Chriſt, the Holy Virgin, and all the ſaints; which they ſuppoſe the church has a right of diſtributing, by virtue of the communion of ſaints. See SUPEREROGATION.

Theſe indulgences were firſt invented in the eleventh century by popes Gregory VII. Victor, and Urban II. as a recompence for thoſe who went in perſon upon the wild enterprize of conquering the Holy Land. See CROISADE. They were afterwards granted to thoſe who hired a ſoldier for that purpoſe, and in proceſs of time were beſtowed on ſuch as gave money for accompliſhing any pious work enjoined by the pope. In the beginning of the twelfth century, the biſhops, whenever they wanted a ſupply of money for their private peculiures, or the exigencies of the church, recurred to the ſcandalous traffic of *indulgences*; and when the Roman pontiffs ſaw that immenſe treaſures were thus accumulated by the inferior rulers of the church, they thought proper to limit the power of the biſhops in remitting the penalties impoſed upon tranſgreſſors, and aſſumed it, almoſt entirely, as a profitable traffic to themſelves. They began with granting a plenary remiſſion of all the temporal pains and penalties which the church had annexed to certain tranſgreſſions; and then proceeded to aboliſh even the puniſhments which are referred in a future ſtate for the workers of iniquity.

The Roman JUBILEE, firſt inſtituted by Boniface VIII. A. D. 1300, carries with it a plenary, or full *indulgence*, for all the crimes committed therein.

The pope alſo grants bulls of plenary *indulgence* to ſeveral churches, monaſteries, and even to private perſons; and it is a frequent thing to have general *indulgences* for the time of the principal feaſts of a year. Their caſuiſts ſay, that a plenary *indulgence* does not always prove effectual, for want of complying with the conditions whereon it was granted.

For the extirpation of hereties it has been a common practice with the popes to grant *indulgences*. Thus Clement XII. "That we may ſtir up and encourage the "faithful to exterminate this ungracious crew of for"lorn wretches, [the Cevenois, when in arms againſt

"Lewis

" Lewis XIV.] we fully grant and indulge the full re-
" miſſion of all ſins, whatever they may be (relying upon
" that power of binding and looſing, which our Lord
" conferred upon his chief apoſtle), to all thoſe that ſhall
" liſt themſelves in this ſacred militia, if they ſhall hap-
" pen to fall in battle." See ABSOLUTION.

Julius II. had beſtowed *indulgences* on all who contributed towards building the church of St. Peter at Rome, and pope Leo X. in order to carry on this magnificent ſtructure, publiſhed *indulgences*, and a plenary remiſſion on the ſame pretence. Finding the project take, he granted the right of promulgating theſe *indulgences* in Germany, together with a ſhare in the profits ariſing from the ſale of them, to Albert, elector of Mentz, and archbiſhop of Magdeburg, who employed Tetzel, a Dominican friar, as his chief agent for retailing them; and he farmed out thoſe of other countries to the higheſt bidders, who, to make the beſt of their bargains, procured the ableſt of their preachers to extol the value of the ware: " Happy times for ſinners, ſays a modern " writer, their crimes were rated, and the remiſſion of " them ſet up by auction. The apoſtolic chamber rated " ſins at a pretty reaſonable rate; it coſt but nine livres " and a few ducats, for crimes which people on this ſide " the Alps puniſhed with death."

Theſe are ſpecified in a book of rates, called the TAX-BOOK of the Holy Apoſtolic Chancery, firſt printed at Rome in the year 1514, and aſcribed by ſome to pope Innocent VIII. From a correct edition of this book, printed by L. Banck, profeſſor at Norkoping, in Gothland, in 1651, it appears that the price of abſolution for fornication, attended with the moſt heinous circumſtances, was ſix groſs or groats; for a layman's murdering a layman, five groats; for laying violent hands on a prieſt, without ſhedding blood, nine groats; for committing inceſt, five groats; for a prieſt's keeping a concubine, ſeven groats; for forging the pope's hand-writing, fourteen or eighteen groats. See the Taxa S. Cancellariæ Apoſtolicæ, a L. Banck. Franequeræ, 1651, p. 126, &c.

It was this great abuſe of *indulgences*, that contributed not a little to the firſt reformation of religion in Germany; wherein Martin Luther began firſt to declaim againſt the preachers of *indulgences*, and afterwards againſt *indulgences* themſelves: but ſince that time, the popes have been more ſparing in the exerciſe of this power; however, they ſtill carry on a great trade with them in the Indies, where they are purchaſed at two reals a-piece, and ſometimes more. See REFORMATION.

INDULGENCE, or INDULTO, ſignifies alſo a ſpecial favour, or privilege, conferred either on a community, or a particular perſon, by the pope's bulls; in virtue whereof the party is licenſed to do or to obtain ſomething contrary to the intention and diſpoſition of the common laws.

There are two kinds of *indultos*: the one *active*, which conſiſts in a power of nominating and preſenting freely, and without reſerve, to benefices that are otherwiſe limited, and reſtrained by the laws of the apoſtolical chancery; ſuch are thoſe ordinarily granted to ſecular princes, cardinals, biſhops, &c.

Paſſive indultos conſiſt in a power of receiving benefices, and expectative graces; of which kind are thoſe of a parliament, of graduates, and mandataries.

The *indultos* of kings is the power given them of preſenting to conſiſtorial benefices, either by treaty, by favour, or ſpecial privilege.

The *indultos* of cardinals is a licence for holding regular as well as ſecular benefices, and for diſpoſing of benefices *in commendam*, or continuing them, &c.

Indulto of parliament is a right of privilege granted to the chancellor, preſidents, counſellors, and other officers in the parliaments of France, to obtain a benefice of the collator, upon the king's nomination directed to him. This is a kind of advowſon, or patronage, belonging to the French king; the *indulto* being a mandate, or grace, by which he is permitted to name to any collator he pleaſes, a counſellor, or other officer of parliament, on whom the collator ſhall be obliged to beſtow a benefice: ſo that the right of the *indulto* reſides radically in the king, the officers being only the objects thereof.

INDULTO, in *Commerce*, denotes a duty, tax, or cuſtom paid to the king of Spain for all ſuch commodities as are imported from the Weſt Indies in the GALLEONS.

INDURATING, a term applied to ſuch things as give a harder or firmer conſiſtence to others, either by the greater ſolidity of their particles, or by diſſipating the thinner parts of any matter, ſo as to leave the remainder harder.

Thus a tumor is *indurated*, either by the addition of earthy and ſolid particles, as in the ſcirrhi, and knotty ſwellings; or by tranſpiring the thinner parts through the ſkin, whereby the remainder grows more fixed, as in an œdema.

INDUSIUM, in the *Healing Art*, a ſhirt or ſhift. It has been a controverted point, among ſome phyſicians, whether it is proper to change the linen in ſome diſtempers or not? the whole of which may be reduced to this: if a perſon does not ſweat, there ſeems to be but very little danger of taking cold; and then clean and freſh linen is not only agreeable but of uſe, as it contributes to promote perſpiration. If the patient ſweats, provided theſe ſweats are ſymptomatical, it does no injury to check them; if critical, it may not be ſo prudent to change the linen while they flow plentifully: but if they remit, there is more danger of taking cold from the wet linen, than there is from changing it, provided it is previouſly well aired. In all caſes, the perſpirable matter, or that of ſweat, impregnates the linen, and becomes in ſome degree acrimonious; which muſt have a very bad influence, in acute diſtempers particularly. And that the acrimony contained in linen, may have a very bad effect in the body, Dimerbroek confirms by a memorable inſtance of ſome perſon or perſons, who, upon recovery from the plague, relapſed immediately and died, upon putting on linen waſhed with ſoap.

As many perſons contract a habit of wearing flannel ſhirts or ſhifts; in order to ſet them right, we ſhall give the judgment of Wainwright thereon.

The moſt certain and conſtant effect of wearing flannel, is to make a more free and plentiful perſpiration; which, though it be attended with great advantages (according to Sanctorius) when moderate; yet when exceſſive, nothing is more pernicious. But ſince the increaſing one evacuation is the leſſening of another; therefore, whenever too much is thrown off from the blood, either by ſtool, urine, or ſaliva; then indeed it may be proper to wear flannel.

That it may appear how prejudicial flannel is to thoſe who perſpire too much, as moſt weak people do, and to whom the wearing of flannel is generally preſcribed, it may be obſerved from Sanctorius, that inſenſible perſpiration is double to the ſenſible evacuations, made by urine and ſtool put together; and that it is to that made by ſtool, as forty to four; ſo that it is ten times more than that by ſtool. Therefore a man will be made no weaker by having ten times as many ſtools as he uſed to have, than he will by perſpiring only double the quantity he uſually does. Farther, if we conſider, that the greateſt part of our ſtools is the remains of our food that could not enter the lacteals, we ſhall find the difference much greater: for it cannot be imagined, that above one tenth of what we void by ſtool is evacuated from the maſs of blood by the liver and inteſtinal glands; ſo that upon this account there is as much derived from the maſs of blood in one day by perſpiration, as by ſtool in an hundred. Therefore, if perſpiration by any means be doubled, in twenty-four hours it will make a man as faint, as if he had an hundred times more ſtools than uſual: and there are none but who expect a weakneſs from an unuſual purging; and we daily experience the ſudden danger of a diabetes wherein the quantity of urine is increaſed; but take little notice of an increaſed perſpiration, becauſe inſenſible: for who reaſon we aſcribe the miſchief it occaſions to ſome other cauſe.

If what has been ſaid is of force ſufficient to perſuade any to leave off wearing flannel; it ſhould be forborne in a warmer ſeaſon; and at the ſame time uſe ſhould be made of a cold bath or a fleſh-brush, which will prevent the inconveniences that might otherwiſe attend it.

INDUSTRY, *fruits of*. See FRUITS.

INEQUALITY *of natural days*. See EQUATION.

INEQUALITY, *optical*. See OPTICAL.

INERTIÆ *vis*. See VIS *Inertiæ*.

INESCUTCHEON, in *Heraldry*, a ſmall *eſcutcheon* borne in a larger one, as part of ſome other coat. *Tab.* II. *Heraldry, fig.* 63. See ESCUTCHEON.

Guillim confines the name to an *eſcutcheon* borne ſingle in the feſs point or centre.

This is alſo ſometimes called an *eſcutcheon of pretence*.

He who marries an heireſs, bears her coat of arms on an *inescutcheon*, or *eſcutcheon of pretence*, in the middle of his own coat.

Modern heralds apply the name *inescutcheon* to thoſe ſmall eſcutcheons, ſeveral of which are borne in a large one.

IN ESSE is applied to things which are actually exiſting.

Authors make a difference between a thing *in eſſe*, and a thing *in poſſe*. A thing that is not, but may be, they ſay, is *in poſſe*, or *potentia*; but a thing apparent and viſible, they ſay, is *in eſſe*, that is, it has a real being *ex inſtanti*; whereas the other is caſual, and at beſt but a poſſibility.

INFALISTATIO, an ancient puniſhment of felons, by throwing them among the rocks and ſands, cuſtomarily uſed in port-towns. It is the opinion of ſome writers, that *infoſſatus* did imply ſome capital puniſhments, by

expoſing the malefactor upon the ſands till the next tide carried him away; of which cuſtom, it is ſaid, there is an old tradition. However the penalty ſeems to take its name from the Norman *falaiſe*, or *falaiſe*, which ſignified both the ſands, but the rocks and cliffs adjoining, or impending on the ſea-ſhore. *Commiſi felonian ob quam fuit ſuſpenſus, utlagatus, vel alio modo morti damnatus*, &c. *vel apud Dover* infallibiture, *apud Southampton ſubmerſus*, &c.

INFALLIBLE, from *in*, taken privatively, and *falle*, *I deceive*, that which cannot deceive, or be deceived.

Upon this term ſtands one of the principal heads of controverſy between the Reformed and the Catholics; the latter of whom maintain, that the church, aſſembled in general council, is *infallible*: which the former deny.

The JESUITS, in their diſputes with the JANSENISTS, have expreſly aſſerted that Jeſus Chriſt hath given to all popes, whenever they ſhall ſpeak *ex cathedrâ*, the ſame *infallibility* which he had, both in matters of right and fact.

The principal reaſons alledged for the *infallibility*, are drawn from the promiſes of Chriſt, from the obſcurity of the Scriptures, the inſufficiency of private judgement, and the neceſſity there is of ſome *infallible* judge for the deciſion of controverſies.

The *infallibility* of the pope is a doctrine of a late ſtanding, and is not entirely acquieſced in, even in their own communion, and altogether rejected by the Gallican church.

INFAMOUS, derived from *in*, and *fama*, *fame*, *report*, in the ordinary uſe of the word, ſignifies ſomething notoriouſly contrary to virtue, or honour.

Aulus Gellius uſes the word *infames materias*, for what we ordinarily call *paradoxes*, i. e. diſcourſes remote from the common opinion; propoſitions that appear oppoſite to truth, &c. as the eloqy of Therſites, the praiſe of a quartan ague, &c.

INFAMOUS, in *Law*, denotes a perſon, or thing, which is of no repute, or eſteem, in the world.

There are two kinds of *infamy*: ſome perſons being *infamous* as having been noted by the laws, or ſtigmatiſed by public judgment.

Infamy, which extends to forgery, perjury, groſs cheats, &c. diſables a man to be a witneſs or juror; but a pardon of crimes reſtores a perſon's credit to make him a good evidence. Judgment of the pillory makes *infamy* by the common law, but by the civil and canon law, if the cauſe for which the perſon was convicted was not *infamous*, it infers no *infamy*.

Others are held *infamous*, by the exerciſe of ſome ſcandalous profeſſion; as a catchpole, a merry andrew, a hangman, an informer, &c.

Heretofore there were crowns of *infamy* given, by way of puniſhment, to criminals: they were made of wool.

INFANCY. See INFANT.

INFANT, in a *Law ſenſe*, a perſon under the age of one-and-twenty years, whoſe acts are in many caſes either void or voidable. All gifts, grants, &c. of an *infant*, which do not take effect by delivery of his hand, are void; and if made to take effect by delivery of his own hand, are voidable by himſelf and his heirs; and thoſe who ſhall have his eſtate. An *infant* may bind himſelf to pay for neceſſaries, as meat, drink, apparel, and learning, but not by bond with penalty; though a bill for neceſſaries, without a penalty for the very ſum due, it is ſaid, will bind him. *Infants* are not obliged to pay for cloaths, unleſs it be averred for their own wearing; and that they were convenient and neceſſary for them to wear, according to their degree and eſtate. An *infant* may buy, but cannot borrow money to buy neceſſaries; for the law will not truſt him with neceſſaries, but at the peril of the lender, who muſt lay it out for him in neceſſaries, or ſee it thus laid out.

An *infant* has been adjudged of age the day before his birth-day; for the law will not make a fraction of a day; therefore where a perſon was born the third of September, and the ſecond of September twenty-one years after, he made his will, it was held good, and that he was then of age to deviſe his lands. And it is ſaid ſuch will ſhall take effect, though the deviſor dies by ſix at night of that day.

An *infant* eight years of age, or upwards, may commit homicide, and be hanged *for* it, if it appear, by any other act, that he had knowledge of good and evil; for here *malitia ſupplebit ætatem*: yet Coke on Littleton, fect. 405. ſays, "An *infant* ſhall not be puniſhed till the age "of fourteen;" which, according to him, is the age of diſcretion.

But this depends on the degree of judgment which he poſſeſſes. If an *infant* be *infra annos infantiæ*, viz. ſeven years old, he cannot be guilty of felony, whatever circumſtances proving diſcretion may appear. See AGE, in *Law*, EXECUTOR, GUARDIAN, &c.

By the cuſtom of GAVEL-*kind*, an *infant*, at the age of fifteen, is reckoned at full age to ſell his lands; and by cuſtom in ſome places, an *infant* ſeiſed of land in SOCAGE, may, at the ſame age, make a leaſe of years, that ſhall bind him after he comes of age. By the cuſtom of London, an *infant*, unmarried, and above the age of fourteen, may bind himſelf apprentice to a freeman of London, by indenture, with proper covenants, which ſhall be binding.

An *infant in ventre ſa mere*, or in the mother's womb, is capable of having a legacy, or a ſurrender of a copy-hold eſtate made to it. It may have a guardian aſſigned to it; and is enabled to have an eſtate limited to its uſe, and to take afterwards by ſuch limitation, as if it were then actually born; and in this point the civil law agrees with our's. Though *infants* cannot alien their eſtates, yet *infant* truſtees or mortgagees are enabled to convey, under the direction of the court of chancery or exchequer, or other courts of equity, the eſtates they hold in truſt or mortgage, to ſuch perſon as the court ſhall appoint. An *infant*, who has an ADVOWSON, may preſent to the benefice when it becomes void. An *infant* is capable of inheriting, and may alſo purchaſe lands, but his purchaſe is incomplete; for, when he comes to age, he may either agree or diſagree to it, without alledging any reaſon; and ſo may his heirs after him, if he dies without having completed his agreement. And in caſe any *infant* bargain and ſell his land by deed, indented and inrolled, yet he may plead non-age.

If an *infant* grants leaſes for a term of years, he may, at his full age, either confirm the leaſe, or bring treſpaſs againſt the leſſee for the occupation. Alſo a leaſe granted to an *infant* may be avoided by waiving the land before the rent-day expreſſed therein. However, *infants* are bound in all acts of neceſſity; as preſentations to benefices, admittances and grants of copy-hold eſtates, aſſenting to legacies, and conditions annexed to lands, whether the eſtate comes by grant or deſcent. If an *infant* be the defendant in an action, the plaintiff ſhall have ſix years for commencing his action, after the defendant comes of age; and an *infant*, who is a plaintiff, has alſo ſix years after he comes of age, to ſue by the ſtatute of limitations.

INFANT, *Diſtemperatures of* INFANTS. It is to be obſerved in general, that all *infants* are not equally expoſed to diſtemperatures of many kinds, but that the children of perſons of tender conſtitutions and idle lives are moſt ſubject to them. The children of poorer people, which are uſually hardily brought up from the firſt, are alſo leſs troubled with diſorders, in general, than thoſe which are taken more care of; and all their lives afterwards are much abler to bear external injuries, and are much leſs affected by them.

The ſeveral diſtempers of *infants* are theſe: *immobility at the birth*, called by authors *anaiſthæſia*. In this caſe, the *infant*, as ſoon as born, remains immovable in its poſition, as if dead. It is to be brought to life and motion in this caſe, by breathing into its mouth, and burning ſaffron under its noſtrils, letting it receive the fume of it, and ſprinkling cold water or wine upon it. When the caſe is leſs violent, the *infant* is often brought to itſelf, by applying it immediately to the breaſt and letting it ſuck; and in the other caſes, this is very proper, after the before mentioned means have been uſed.

A yellow colour of the ſkin is another very common complaint in new-born *infants*, ſo that they look as if they had the JAUNDICE. This is an accident of no ill conſequence. It often goes off of itſelf, after voiding the firſt ſtools; and if it does not, is eaſily removed by giving the *infant* a ſmall quantity of ſyrup of rhubarb, and of the common abſorbent powders, with antimonium diaphoreticum. In this caſe the child is to be kept warm, ſo that it may ſweat moderately while it takes theſe medicines.

Difficulty of ſwallowing is alſo a common complaint in *infants*. If this happens from that fault of the frenulum of the tongue, which renders the child TONGUE-*tied*, as the good women expreſs it, this is to be removed by cutting it. If it be cauſed by aphthæ, or little ulcers in the mouth, theſe are to be treated as below. If it proceed from a tumor of the tongue, the diſcutient waters are to be put in ſmall quantities into the mouth every two or three hours; and if there be ulcerations upon the tongue, the beſt of all applications is the oil of eggs. But before any thing is done for the child, it is neceſſary to ſee whether the fault be not in the mother from her having no milk, or from the nipples being ſo depreſſed that the child cannot uſe them.

Imperforations of the neceſſary parts. Theſe ſometimes happen in *infants*, ſo that there is either no paſſage for the ſtools, or for the urine: ſometimes for neither. This caſe is rare; but when it happens, ſpeedy help muſt be had, or the *infant* periſhes. In caſes where the paſſage

is

is regularly formed, but is only ſtopt up by mucous matter, which ſometimes happens; the gentle abſtergents are to be given, as the crabs-eyes or ſome other abſorbent, hall ſated with an acid; and recourſe muſt be had to the uſe of a ſmall catheter or glyſter-pipe. But when there is a preternatural membrane formed, which ſtops thoſe paſſages, this muſt be cut through by a ſurgeon.

The noſtrils of *infants* are often plugged up with a groſs mucus, which prevents their breathing freely, and likewiſe renders it difficult for them to ſuck or ſwallow. In obſtinate caſes, after a ſuitable purge, two or three grains of white vitriol, to which ſome add the ſame quantity of *elaterium*, diſſolved in half an ounce of marjoram water, and filtered, may be applied now and then to the noſtrils with a linen rag. But in common it will be ſufficient to rub the noſe at bed-time with a little ſweet oil, or freſh butter.

Retention of the firſt ſtools, or MECONIUM, which is in the bowels at the time of the birth. This diſtemperature in the body occaſions the *infant* many ſevere pains, and throws it into great danger; difficulty of breathing, pains in the abdomen, inquietude, and convulſions, are the conſequences of it. Nature often cures theſe by a diſcharge of bilious acrid ſtools, which are ſometimes green, ſometimes yellow like the yolk of an egg. When nature is not wiſe to do this in time, ſhe is to be aſſiſted by a little manna or magneſia alba; or a common ſpoonful of whey, ſweetened with a little honey, will anſwer the purpoſe. The moſt proper medicine for expelling the meconium is the mother's milk, which is always, at firſt, of a purgative quality. Were children allowed to ſuck as ſoon as they ſhew an inclination for the breaſt, they would ſeldom have occaſion for medicines to diſcharge the meconium; but even where this is not allowed, they ought never to have daubs of ſyrup, oils, and other indigeſtible ſtuff crammed down their throats.

Stuffings of the breaſt attend ſome *infants* in ſuch a degree, that they ſeem aſthmatic. In theſe caſes the ſolutive ſyrups of rhubarb and roſes are to be given; and afterwards the pectorals, as the ſyrup of eryſimum and maidenhair, or ſyrup of liquorice. An emetic may alſo be given of the ſyrup or conſerve of peach-bloſſoms, and a ſingle grain of calomel, or two of the utmoſt, may be given and often have great ſucceſs. If theſe fail, ſmall doſes may be given of powders prepared of diaphoretic antimony with twice its weight of denonated nitre; and the common reſolvents, ſuch as the orris root and ſperma-ceti, may be added; and ſometimes it is neceſſary to add a ſmall doſe of tartarum vitriolatum, with ſome of the common abſorbent powders. See CROUP.

Coughs ſometimes attend *infants*, but they are ſeldom obſtinate, uſually giving way to the common pectoral ſyrups, or a little ſperma-ceti, after the bowels have been unloaded by the laxative ſyrups, or other gentle cathartics. See CHIN-*cough*.

Corzas and gravedos happen alſo ſometimes to *infants*; in theſe caſes the common ſyrups before preſcribed are to be given; and if they fail of effect, the nurſe muſt take the medicines proper in theſe caſes; which ſee under their proper heads.

Running of the eyes and ears. This is a very common complaint, and is to be cured by ſmall doſes of decoctions of pimpernel-root, ſaſſafras, and the other ſweetening woods, and by gentle laxatives on the intermediate days, in which calomel in ſmall doſes of a gram or two ought always to have its part; and the more acrid the matter diſcharged is, the more neceſſary is it to add to theſe things the mucilaginous medicines, ſuch as the ſolutions of gum arabic and tragacanth in water, and mucilage of the ſeeds of quinces made by gently boiling them.

Chafings of the fleſh are very common in *infants*, and uſually ariſe from the ſweats, urine, or acrid ſtools diſcharged upon the parts, eſpecially when their nurſes are ſo careleſs as to keep them dirty, and ſuffer thoſe things to remain long on the parts. In this caſe common flour or powder, will often prove a cure; or, when that fails, a little camphor and ceruſs mixed among it, uſually prove effectual. One of the beſt applications for this purpoſe is a ſolution of fuller's earth in a ſufficient quantity of hot water, which ſhould be gently rubbed, when cold, upon the galled parts once or twice a day. See EXCORIATION and GALLING.

But if internal cauſes concur, ſuch as ſharpneſs of the blood, and humours in the child, then the common abſorbent and ſweetening powders are to be given internally, at the ſame time that the others are applied externally to the parts.

The moſt effectual means for preventing theſe chafings are to waſh the parts frequently with cold water, to change the linen often, and to keep the child in all reſpects thoroughly clean.

Vomitings, in *infants*, are rather ſalutary than hurtful, provided they are moderate; but when they are violent, they are to be remedied by giving gentle glyſters, to give a derivation to the mucous matter downward, and at the ſame time applying externally the common ſtrengthening and ſtomachic plaſters, as oil of mace, and the like, and repeating theſe applications as often as found neceſſary.

When vomiting is occaſioned by too much food, it ought to be promoted by a few grains of ipecacuanha, or by making the child drink freely of luke-warm water, or weak infuſion of camomile flowers. When the food has been of an acrid or irritating quality, a milder aliment ſhould be ſubſtituted in its ſtead. When vomiting proceeds from an increaſed degree of ſenſibility, or too great an irritability of the nerves of the ſtomach, ſuch medicines as have a tendency to brace that organ and abate its ſenſibility, muſt be uſed. The firſt intention may be anſwered by a ſlight infuſion of the Peruvian bark, with the addition of a little rhubarb and orange-peel; and the ſecond by the ſaline draughts, to which a few drops of liquid laudanum may be occaſionally added.

Diarrhœas in *infants* are uſually attended with pain, and the ſtools are four, ſlimy, green, or curdled: it is not ſafe to uſe aſtringents to them, but they may generally be cured by a gentle vomit of ipecacuanha, and afterwards ſmall and gentle doſes of rhubarb, interpoſing abſorbing medicines to mitigate the acrimony of the humours. The beſt purge in this caſe is magneſia alba, which is abſorbent and laxative, and operates without exciting gripes. The antimonial wine, acting both as an emetic and purge, is an excellent medicine in this caſe: and it may be diluted with water to ſuit the weakeſt conſtitution. If any gripings ſhould remain, after the ſtomach and bowels have been cleanſed, a teaſpoonful of ſyrup of poppies may be given in a little ſimple cinnamon water, three or four times a day, till theſe ſymptoms have ceaſed. See DIARRHŒA.

Coſtiveneſs in infants is a much more dangerous complaint, ſubjecting them to many diſorders. The common purgative ſyrups of roſes and peach-flowers are to be given in this caſe, as alſo emollient clyſters; and ſuppoſitories are to be applied, for which purpoſe nothing is ſo proper as a piece of parſley-root cut into a proper ſhape, and introduced after rubbing it over with butter. Heiſter recommended two or three grains of rhubarb in ſolutive ſyrup of roſes, or a ſolution of manna, till the child's belly is opened, and afterwards the teſtaceous powders. It is neceſſary, however, to diſtinguiſh this coſtiveneſs from a natural firmneſs of the ſtools when they are voided at moderate diſtances of time, and without pain; for this is a very ſalutary habit in children, after the meconium is voided in the firſt ſtools: it ſhews a ſtrength in the child, and is to be accounted a good ſymptom. See COSTIVENESS.

Acidities accompany moſt diſeaſes of children, and are oftener the effect than the cauſe of thoſe diſeaſes. When green ſtools, gripes, purgings, ſour ſmells, &c. ſhew that the bowels abound with an acid, the child ſhould have a little ſmall broth, with light white bread in it, and ſufficient exerciſe to promote the digeſtion. The teſtaceous powders which have been cuſtomarily adminiſtered in this caſe, ſhould never be given unleſs mixed with purgative medicines, as rhubarb, manna, or ſuch like. The beſt medicine is the magneſia alba, which purges, and, at the ſame time, corrects the acidity. It may be given in any kind of food, or in the *laxative abſorbent* MIXTURE. When an *infant* is troubled with gripes, its body ſhould be opened with an emollient clyſter, or the medicine juſt mentioned; and at the ſame time a little brandy may be rubbed on its belly with a warm hand before the fire: but brandy, ſpices, and other hot things ſhould be avoided; except in caſes where the above method fails; in which a little brandy or other ſpirits may be mixed with twice the quantity of warm water, and a tea-ſpoonful of it given frequently till the *infant* be eaſier. Sometimes a little peppermint water will anſwer the purpoſe very well.

Cutaneous eruptions. Theſe attend children in various forms, and are of very different kinds; they are chiefly owing to improper food and neglect of cleanlineſs: a proper attention to theſe will generally be ſufficient to remove them; but if this fails, ſome drying medicines will be neceſſary. Whilſt they are applied, the body ſhould be kept open, and cold carefully avoided. For this purpoſe, a little of the flowers of ſulphur may be mixed with freſh butter, oil, or hog's lard, and the parts affected frequently touched with it. See ACNOR, CRUSTA *lactea*, TINEA, and CHILBLAINS.

Aphthæ. In this complaint *infants* are found to have their tongues covered over with little whitiſh ulcers, affecting alſo the whole inſide of the mouth, throat, and ſtomach;

ſtomach: and ſometimes reaching through the whole inteſtinal canal, in which caſe they are very dangerous. See APHTHÆ.

This diſorder ſometimes ariſes from internal heat, ſometimes from the frequency and eagerneſs of the child's ſucking. The mouth in this caſe is to be wiped and cleanſed frequently with a rag dipped in wine and honey, or with a coarſer cloth dipped in ſyrup of mulberries; or, with the following mixture, made of fine honey an ounce, borax a dram, burnt alum half a dram, and roſe-water two drams. A very proper application in this caſe is a ſolution of ten or twelve grains of white vitriol in eight ounces of barley water. The moſt proper medicines for the aphthæ or thruſh, are vomits of ipecacuanha, emetic tartar, or antimonial wine, and gentle laxatives. Five grains of rhubarb, and half a dram of magneſia alba may be rubbed together, and divided into ſix doſes, one of which may be given every four or five hours, till they operate. Calomel has been ſometimes uſed; but it often occaſions gripes and ſometimes convulſions, and, therefore, ſhould be given to *infants* with the greateſt caution.

Convulſions. Theſe are cauſed in children by ſeveral different means, and therefore require a different treatment. Whatever greatly irritates or ſtimulates the nerves may occaſion convulſions. Hence *infants* whoſe nerves are eaſily affected, are often thrown into convulſions, by any thing that irritates the alimentary canal; by teething; ſtrait cloaths; and the approach of the ſmall pox, meaſles, or other eruptive diſeaſes. If they ariſe from a repreſſion of ſweats, the common alexipharmics are to be given, and in the intermediate times ſmall doſes of mercurius dulcis. If they are owing to acrimonious humours in the bowels, the cure may be begun with a clyſter, and afterwards a gentle vomit, which may be repeated occaſionally; and the body in the mean time kept open by gentle doſes of magneſia alba, or ſmall quantities of rhubarb mixed with the powder of crab's claws. When they are cauſed by abundant ſeroſities, valerian root and aurum fulminans are greatly recommended. When they are epileptic, and return very frequently, cinnabar is to be given freely in powders; and when they are owing to worms, mercurius dulcis is the beſt of all remedies.

Convulſions which precede the eruption of the ſmall-pox or meaſles generally go off when theſe make their appearance. And, therefore, a little time, bathing the feet, and throwing in a mild clyſter will ſet all to rights. When convulſion fits attend DENTITION, beſides gentle evacuations, bliſtering may be proper, and the uſe of antiſpaſmodic medicines, as the tincture of ſoot, aſa fœtida, or caſtor. When convulſions proceed from any external cauſe, as ſtrait cloaths and bandages, theſe ought to be immediately removed. Convulſions that are not owing to any of the complaints already recited, moſt probably proceed immediately from the brain: but theſe ſeldom happen. In endeavouring to remove theſe, the chief intention is to make ſome derivation from the head, by bliſtering, purging, &c. If theſe fail, iſſues or ſetons may be put in the neck or between the ſhoulders.

For other diſeaſes of *infants*, ſee DENTITION, HYDROCEPHALUS, RICKETS, and WORMS.

It is to be obſerved in general, that of the diſeaſes of children the far greater number are wholly owing to external cauſes, very few of them to any internal fault in the conſtitution. The principal of theſe external cauſes, are the following:

1. Changes of the temperature of the air. Theſe are brought on in regard to *infants* at the nurſe's pleaſure, and it is often thrown into too profuſe ſweats by a cloſe room and too warm covering, and perhaps in the midſt of this ſweat is immediately taken from under that covering, and expoſed to the open air. To this are owing moſt of the catarrhal affections to which *infants* are ſubject, and their fevers and cutaneous eruptions of the ſeveral kinds.

2. Improper food and drink are another great ſource of the diſeaſes of *infants*. Nurſes frequently ſtarve children, and more frequently cram them with much more food than is neceſſary; and beſides theſe irregularities in regard to quantity, errors in the quality are not leſs fatal. A thin and bilious milk throws them into gripings of the bowels, and bilious diarrhœas; and milk when too thick gives them ſtuffings or ſtoppages at the breaſt, and ſometimes ſuffocative catarrhs. And finally, the milk of a perſon, who has a remaining taint of the venereal diſeaſe, ſubjects the child to breakings-out, and ulcers of many kinds.

3. Motion and reſt improperly managed are alſo the ſources of many of the complaints of children. Nothing is more prejudicial to the health of a child than that frequent cuſtom of idle nurſes of rocking a child to ſleep, whether it will or not; the violent and continual motion in this caſe often gives the child a vertigo, which it never afterwards gets rid of.

The binding children too tight in their dreſs, is alſo another great cauſe of diſorders, by obſtructing the due motions of nature in the circulation of the blood. The ſetting children too early on their feet, and compelling them to walk too early, is alſo the cauſe of many miſchiefs. And nothing is more miſchievous than the frequent diſturbing them out of their ſleep: this makes them peeviſh, and torpid, and ſleepy at other times.

4. The ſuppreſſion of the natural excretions is alſo the origin of many diſorders; and though this may ſometimes happen from an innate cauſe in the *infant*, it much oftener is owing to the perverſeneſs of the nurſe in feeding on acid foods, or ſuch as are hard of digeſtion; and expoſing the child, as well as her own breaſts to the cold air, when they are hot.

Infants, from the great tenderneſs of their parts, are much more ſubject to the ſeverity of diſeaſes than grown perſons; yet experience ſhews us, that they uſually get through them with leſs danger. An inſtance of this is evident in the ſmall-pox, from which people in general eſcape much better when young than at any other time. Convulſions, violent hiccoughs, and fevere and almoſt continual crying, are obſerved very often to be fatal to children in the firſt ſix weeks; but are much leſs dangerous afterwards: and convulſions become habitual to children, though they are often very frequent in their returns upon every ſlight occaſion, yet are found much leſs dangerous than in other caſes. In general, all diſeaſes come to a ſhorter period in *infants* than in grown perſons.

Moſt of the diſtemperatures of children, in the firſt ſtage of infancy, ariſe chiefly from their bowels, and are to be cured by gentle correctives and evacuants; and of theſe the very mildeſt in their operation are always to be choſen. The uſe of gentle vomits is ſafe and proper. Five or ſix grains of the powder of ipecacuanha may be mixed in two table-ſpoonfuls of water, and ſweetened with a little ſugar: a tea-ſpoonful of this may be given every quarter of an hour till it operates. Or, a grain of emetic tartar may be diſſolved in three ounces of water, ſweetened with a little ſyrup, and given in the ſame manner. Or, ſix or ſeven drops of the antimonial wine may be adminiſtered in a tea-ſpoonful of water or thin gruel. Theſe medicines will cleanſe the ſtomach, and, generally, open the belly; but if the child be coſtive, manna and pulp of caſſia may be diſſolved in boiling water, and given in ſmall quantities till it operates; or a few grains of magneſia alba may be mixed in any kind of food, that is given to the child, and continued till it has the deſired effect. Some have highly extolled the uſe of mercurius dulcis or calomel, given from one grain to three or four, as a purge for children, which have no fever, eſpecially in caſes of diſorder ariſing from the retropulſion of cutaneous humours: but others think this medicine ſhould be uſed with great caution.

Manna, infuſions of ſena, and ſmall doſes of ſyrup of buck-thorn, may alſo be given as purges to children, where there is no fever joined with their complaints; but where there is a feverith diſpoſition, rhubarb is to be preferred. In violent gripings and pains attended with crying out, terrors and tremblings, and acrid ſtools, mucilaginous medicines often prove of more ſervice than the abſorbents. Worms in *infants*, when alive in the bowels, often bring on atrophies and convulſions; and when dead and putrified, they occaſion many malignant effects, with convulſions and often unaccountable ſymptoms. When alexipharmic or diuretic medicines are found neceſſary, it is always much better to give them to the nurſe than to the child; but antimony-diaphoretic, when faithfully prepared, is a medicine of great power, and yet ſo ſafe that it may be given to the *infant*. Narcotic medicines are to be given with the utmoſt caution; a ſingle grain of theriaca ſeems as proper as any thing for this purpoſe. Cinnabar in ſmall doſes is found to be an excellent remedy in convulſions; but if it be given too freely, it generally loads the ſtomach. Junker and Buchan.

INFANTE and INFANTA, are titles of honour given to the children of ſome princes; particularly theſe of the houſes of Spain and Portugal.

It is uſually ſaid, that the appellation *infante* was introduced into Spain, on occaſion of the marriage of Eleanor of England with king Ferdinand of Caſtile; and that their ſon Sancho was the firſt that bore it.—But this is contradicted by Pelagius biſhop of Oviedo, who lived in the year 1100, and who informs us, that the titles *infante* and *infanta* were uſed in Spain ever ſince the reign of king Evremond II.

INFANTRY, the body of foot-soldiers, in an army, or other corps.

The *infantry* ſtand contradiſtinguiſhed from the *cavalry*, or horſe.

INFANTRY *exerciſe*. See EXERCISE.

INFARCTION *of the liver*. See HEPATIS *infarctus*.

INFARCTION *of the ſpleen*. See SPLEEN.

INFATUATE, to preposſeſs any one in favour of ſome perſon or thing that does not deſerve it, ſo far as that he cannot eaſily be diſabuſed.

The word *infatuate* comes from the Latin *fatuus*, *fool*: of *fari*, *to ſpeak out*; which is borrowed from the Greek φαω, whence φατις, which ſignifies the ſame with *vates* in Latin, or *prophet* in Engliſh: and the reaſon is: becauſe their prophets or prieſts uſed to be ſeized with a kind of madneſs, or folly, when they began to make their predictions, or deliver oracles.

The Romans called thoſe perſons *infatuated*, *infatuati*, who fancied they had ſeen viſions, or imagined the god Faunus, whom they call *Fatuus*, had appeared to them.

INFECTION, the catching a diſeaſe, by ſome effluvia, or fine particles, which fly off from diſtempered bodies, and, mixing with the juices of others, occaſion the ſame diſorders as were in the bodies they came from.

The word comes from the Latin verb *inficere*, which properly ſignifies to dye of ſome other colour; *inficere*, i. e. *facere*, *ut aliquid intus ſit*, to occaſion ſomething to be imbibed. See CONTAGION.

INFERIÆ, in *Antiquity*, ſacrifices offered to the dii manes, or the ſouls of deceaſed heroes and illuſtrious perſons; or even of any relation or perſon whoſe memory was held in veneration.

INFERIOR, ſtands oppoſed to SUPERIOR.

INFERIOR *courts of record*, in *Engliſh Law-writers*, is uſed as a general name for corporation-courts, courts leet, and ſheriffs-torns. See COURTS.

Moſt courts are ſubordinate to ſome other; but for diſtinction take the term *inferior-court* is by Sir Matthew Hale, and others, applied in the manner here mentioned

INFERIOR, *maxilla*, *ocean*, *planet*. See the ſubſtantives.

INFERIOR *penis*, in *Anatomy*, a name given by Spigelius to one of the muſcles of the penis, generally called the accelerator by the moderns; and by Veſalius, and others of his time, *primus penis*.

INFERIOR *obliquus*, *ſerratus*, *ſubſcapularis*. See the ſeveral articles.

INFERIORIS *labii depreſſor*, *labii elevator*. See DEPRESSOR, and ELEVATOR.

INFERNAL *glaſs*, in *Chemiſtry*, is a name given to the BOLT-*head*, when its ſtem is continued downward into the body of the glaſs veſſel, and left open only by a very ſmall oriſice.

INFERNAL-*ſalt*, a name given by Hoffman, and ſome other of the chemical writers, to nitre; they have alſo called it *terberus chemicus*.

INFERNAL *ſtone*. See LAPIS *infernalis*, CAUSTIC and CRYSTALS of *ſilver*.

INFERTILITY. See FERTILITY.

INFIBULATION, in *Antiquity*. It was a cuſtom among the Romans, to *infibulate* their ſinging boys, in order to preſerve their voices: for this operation which prevented their retracting the prepuce over the glans, and is the very reverſe to circumciſion, kept them from injuring their voices by premature and prepoſterous venery: ſerving as a kind of padlock, if not to their inclinations, at leaſt to their abilities. It appears by ſome paſſages in Martial, that a leſs decent uſe was made of *infibulation* among the luxurious Romans: for ſome ladies of diſtinction, it ſeems, took this method of confining their paramours to their own embraces. Juvenal alſo hints at ſome ſuch practice. Celſus, a chaſte author, ſays, *infibulation* was ſometimes practiſed for the ſake of health; and nothing deſtroys it more than the filly practice this operation ſeems intended to prevent. This practice is not perhaps likely to be revived; if however any one who has ſuffered in his conſtitution by prepoſterous venery, ſhould be able to get children, and ſhould be inclined to prevent the ſame miſfortune in them, by *infibulation*; the method of doing it is thus:

The ſkin which is above the glans is to be extended, and marked on both ſides with ink, where it is perforated, and then ſuffered to retract itſelf. If the marks recur upon the glans, too much of the ſkin has been taken up, and we muſt make the marks farther; if the glans remain free from them, they ſhew the proper place for affixing a *fibula*: then paſs a needle and thread through the ſkin where the marks are, and tie the threads together; taking care to move it every day, until the parts about the perforations are cicatrized: this being effected take out the thread, and put in the *fibula*; which the lighter it is the better. Celſus, lib. vii. cap. 25.

Authors have not determined what the FIBULA of the ancient ſurgeons was, though no doubt they were for different purpoſes. In the preſent caſe, the *fibula* ſeems to mean a ring of metal, not unlike what the country people put through the noſes of ſwine.

INFIDEL, a term applied to ſuch perſons as are not baptized and that do not believe the truths of the Chriſtian religion. See DEIST.

INFINITE, that which has neither beginning, nor end: in which ſenſe God alone is *infinite*.

INFINITE is alſo uſed to ſignify that which has had a beginning, but will have no end; as angels, and human ſouls.

This makes what the ſchoolmen call *infinitum a parte poſt*; as, on the contrary, by *infinitum a parte ante*, they mean that which has an end, but had no beginning. See INDEFINITE and FINITE.

INFINITE, in *Mathematics*, as applied to quantities which are either greater, or ſmaller, than any aſſignable ones. In which ſenſe it differs not much from what we otherwiſe call *indefinite*, or *indeterm nate*. Thus, an

INFINITE, or INFINITELY *great line*, in geometry, denotes only an indefinite or indeterminate line; to which no certain bounds, or limits, are preſcribed.

INFINITE *quantities*. Though the idea of magnitude infinitely great, or ſuch as exceeds any aſſignable *quantity*, does include a negation of limits; yet all ſuch magnitudes are not equal among themſelves; but beſides *infinite* length, and *infinite* area, there are no leſs than three ſeveral ſorts of *infinite* ſolidity; all of which are quantities *ſui generis*; and thoſe of each ſpecies are in given proportions.

Infinite length, or a line infinitely long, is to be conſidered, either as beginning at a point, and ſo infinitely extended one way; or elſe both ways from the ſame point: in which caſe the one, which is a beginning of infinity, is one half of the whole, which is the ſum of the beginning and ceaſing *infinity*, or, *infinity a parte ante*, and *a parte poſt*, which is analogous to eternity in time or duration; in which there is always as much to follow, as is paſt any point or moment of time.

Nor does the addition or ſubtraction of time, length or ſpace of time, alter the caſe, either as to infinity or eternity; ſince neither the one nor the other can be any part of the whole.

As to infinite ſurface or area, any right line infinitely extended both ways on an *infinite* plane, divides that plane into equal parts, the one to the right, and the other to the left of the ſaid line; but if from any point in ſuch a plane, two right lines be infinitely extended, ſo as to make an angle; the *infinite* area, intercepted between theſe *infinite* right lines, is to the whole *infinite* plane, as the arch of a circle drawn on the point of concourſe of thoſe lines as a centre, intercepted between the ſaid lines, is to the circumference of the circle; or as the degrees of the angle to the 360 degrees of a circle.

For an example—Two *infinite* right lines meeting at a right angle on an *infinite* plane, do include a quarter part of the whole *infinite* area of ſuch a plane: if two parallel *infinite* lines be ſuppoſed drawn on ſuch an *infinite* plane, the area intercepted between them will be likewiſe *infinite*; but at the ſame time it will be infinitely leſs than the ſpace intercepted between two *infinite* lines, that are inclined, though with never ſo ſmall an angle, becauſe in the one caſe the given *finite* diſtance of the parallel lines diminiſhes the infinity in one degree of dimenſion; whereas in a ſector, there is infinity in both dimenſions; and conſequently the quantities are one infinitely greater than the other, and there is no proportion between them.

From the ſame conſideration ariſe three ſeveral ſpecies of *infinite* ſpace or ſolidity; for a parallelepiped, or a cylinder infinitely long, is greater than any *finite* magnitude, how great ſoever; all ſuch ſolids ſuppoſed to be formed on a given baſis, are in proportion to one another, as thoſe baſes. But if two of thoſe three dimenſions are wanting, as in the ſpace intercepted between two parallel planes infinitely extended, and at a finite diſtance; or with infinite length and breadth, it have a finite thickneſs; all ſuch ſolids ſhall be as the given finite diſtances one to another.

But theſe quantities, though infinitely *greater* than the other, are yet infinitely leſs than any of thoſe wherein all the three dimenſions are *infinite*—Such are the ſpaces intercepted between two inclined planes infinitely extended; the ſpace intercepted by the ſurface of a cone, or the ſides of a pyramid, likewiſe infinitely continued, &c. of all which, notwithſtanding the proportions of one to another, and to the whole, or laſt abyſs of *infinite* ſpace (wherein is the locus of all things that are, or can be) or to the ſolid of *infinite* length, breadth, and thickneſs (taken all manner of ways) are eaſily aſſignable—For the ſpace between two planes is to the whole, as the

angle of those planes to the 360 degrees of the circle. As for cones and pyramids, they are as the spherical surface intercepted by them, is to the surface of the sphere; and therefore cones are as the versed fines of half their angles, to the diameter of the circle: these three sorts of *infinite* quantity are analogous to a line, surface, and solid; and, like them, cannot be compared or have any proportion one to another.

INFINITES, *Arithmetic of.* See ARITHMETIC.

INFINITES, *Characters in arithmetic of.* See CHARACTER.

INFINITE *Decimals.* See REPETEND.

INFINITE *Proposition*, in *Logic.* See PROPOSITION.

INFINITE *Diffeisi*, in *Law.* See DISTRESS.

INFINITELY *small quantity*, called also an *infinitesimal*, is that which is so very minute, as to be incomparable to any finite quantity; or it is that which is less than any assignable quantity.

An *infinite* quantity cannot be either augmented, or lessened, by adding or taking from it any finite quantity; neither can a finite quantity be either augmented, or lessened, by adding to, or taking from it an *infinitely small quantity.*

If there be four proportionals, and the first be *infinitely* greater than the second, the third will be *infinitely* greater than the fourth.

If a finite quantity be divided by an *infinitely* small one, the quotient will be an *infinitely* great one; and if a finite quantity be multiplied by an *infinitely* small one, the product will be an *infinitely* small one; if by an *infinitely* great one, the product will be a finite quantity.

If an *infinitely* small quantity be multiplied into an *infinitely* great one, the product will be a finite quantity.

In the method of infinitesimals, or of *infinitely* small quantities, the element by which any quantity increases or decreases is supposed to be *infinitely* small, and is generally expressed by two or more terms; some of which are *infinitely* less than the rest, which being neglected as of no importance, the remaining terms form what is called the difference of the proposed quantity. The terms that are neglected in this manner, as *infinitely* less than the other terms of the element, are the very same which arise in consequence of the acceleration, or retardation, of the generating motion, during the *infinitely* small time in which the element is generated: so that the remaining terms express the element that would have been produced in that time, if the generating motion had continued uniform, as is farther explained under FLUXION.

Therefore those differences are accurately in the same ratio to each other, as the generating motions or fluxions. And hence, though infinitesimal parts of the elements are neglected, the conclusions are accurately true, without even an *infinitely* small error, and agree precisely with those that are deduced by the method of fluxions. In order to render the application of this method easy, some analogous principles are admitted, as that the *infinitely* small elements of a curve are right lines, or that a circle is a polygon of an infinite number of sides, which being produced give the tangents of the curve, and by their inclination to each other measure the curvature. This is as if we should suppose that when the base flows uniformly, the ordinate flows with a motion which is uniform for every *infinitely* small part of time; and increases, or decreases, by *infinitely* small differences at the end of every such time.

But however convenient this principle may be, it must be applied with caution and art, on various occasions. It is usual therefore, in many cases, to resolve the element of the curve into two or more *infinitely* small right-lines: and sometimes it is necessary (if we would avoid error) to resolve it into an infinite number of such right lines, which are infinitesimals of the second order. In general it is a *postulatum* in this method, that we may descend to infinitesimals of any order whatever, as we find it necessary; by which means any error that might arise in the application of it, may be discovered and corrected by a proper use of this method itself.

It is also to be observed, that when the value of a quantity that is required in a philosophical problem becomes in certain particular cases *infinitely* great, or *infinitely* little, the solution would not be always just, though such magnitudes were admitted. As when it is required, to find by what centripetal force a curve could be described about a fixed point that is either in a curve, or is so situated that a tangent may be drawn from it to the curve. The value of the force is found *infinite* at the centre of the forces in the former case, and at the point of contact in the latter: yet it is obvious, that an *infinite* force could not inflect the line described by a body that should proceed from either of these points, into a curve; because the direction of its motion in either case paſſes through the centre of the forces, and no force how great ſoever that tends towards the centre could cauſe it to change that direction. But it is to be obſerved, that the geometrical magnitude by which the force is meaſured is no more imaginary in this than in other caſes, where it becomes *infinite*; and philoſophical problems have limitations that enter not always into the general ſolution given by geometry.

But although by proper care errors may be avoided in the method of infiniteſimals, yet it muſt be owned that to ſuch who have been accuſtomed to a more ſtrict and rigid kind of demonſtration in the elementary parts of geometry, it may not ſeem to be conſiſtent with perfect accuracy, that, in determining the firſt differences, any part of the element of the variable quantity ſhould be rejected, merely becauſe it is infinitely leſs than the reſt; and that the ſame part ſhould be afterwards employed for determining the ſecond and higher differences, and reſolving ſome of the moſt important problems. Nor can we ſuppoſe, that their ſcruples will be removed, but rather confirmed, when they come to conſider what has been advanced by ſome of the moſt celebrated writers on this method, who have expreſſed their ſentiments concerning *infinitely* ſmall quantities in the preciſeſt terms; while ſome of them deny their reality, and conſider them only as incomparably leſs than finite quantities, in the ſame manner as a grain of ſand is incomparably leſs than the whole earth; and others repreſent them, in all their orders, as no leſs real than finite quantities. And although it appears from what has been ſaid in this article, that a ſatisfactory account may be given for the brief way of reaſoning that is uſed in the method of infiniteſimals; while nothing is neglected without accounting for it; and that the harmony between the method of fluxions and that of infiniteſimals thus appears more perfect.

And however ſafe and convenient this method may be, yet ſome will always ſcruple to admit *infinitely* little quantities, and *infinite* orders of infiniteſimals, into a ſcience that boaſts of the moſt evident and accurate principles, as well as of the moſt rigid demonſtrations. It is therefore proper, that this extenſive and uſeful doctrine ſhould be eſtabliſhed on unexceptionable principles. See the articles FLUXION, and LIMIT. See alſo *Sir.* Maclaurin's Treat. of Fluxions in the introduction, p. 30, 40, &c. and book i. art. 495 to 502.

INFINITELY *Infinite Fractions*, or all the powers of all the fractions whoſe numerator is one, are together equal to an unit. See the demonſtration hereof given by Dr. Wood, in Hooke, Phil. Coll. N° 3. p. 45. ſeq.

Hence, it is deduced, 1°, That there are not only *infinite* progreſſions, or progreſſions *in infinitum*; but alſo *infinitely* farther than one kind of infinity. 2°, That the *infinitely* infinite progreſſions are notwithſtanding computable, and to be brought into one ſum; and that not only finite, but ſo ſmall as to be leſs than any aſſignable number. 3°, That of *infinite* quantities, ſome are equal, others unequal. 4°, That one *infinite* quantity may be equal to two, three, or more other quantities, whether *infinite* or finite.

INFINITE *Series.* See SERIES.

INFINITIVE, in *Grammar*, the name of one of the MOODS, which ſerve for the conjugating of verbs.

The *infinitive* does not denote any preciſe time, nor does it determine the number, or perſons, but expreſſes things in a looſe indefinite manner; as, *to read*, &c.

Hence the Latin and modern grammarians have called verbs under this mode, from this their indefinite nature, *infinitives*. Sanctius has given them the name of impersonals; and the Greeks that of ἀπαρέμφατα from the ſame reaſon of their not diſcovering either perſon or number.

Infinitives, ſays Mr. Harris, not only lay aſide the character of ATTRIBUTIVES, but they alſo aſſume that of SUBSTANTIVES, and are diſtinguiſhed with their ſeveral attributes: e. g. *Dulce & decorum* eſt pro patria MORI; SCIRE *tuum nihil* eſt, &c.

Hence the *infinitive* has been ſometimes called ὄνομα ῥηματικὸν, a verbal noun; ſometimes ὄνομα ῥηματικὸν, the verb's noun. The reaſon of the appellation is evident in Greek, by its taking the prepoſitive article before it in all caſes; thus, τὸ γράφειν, τὸ γράψαι, τὸ γράψειν. The ſame conſtruction is not unknown in Engliſh. Thus Spencer,

For not to have been dipped in Lethe lake
Could ſave the ſon of Thetis from to die i. e.

ΑΥΤΟ ΤΟ ΕΙΝΑΙ.

The Stoics held the *infinitive* as the genuine ῥῆμα or verb, a name which they denied to all other modes, becauſe the true verbal character was conceived to be contained ſimple and unmixed in the *infinitive* only; thus, *to walk*, means ſimply that energy, and nothing more: the other modes,

beſides expreſſing this energy, ſuperadd certain affections, which reſpect perſons and circumſtances. The *infinitive*, ſays Priſcian, *ſignificat ipſam rem, quam continet verbum.* The' *infinitive*, in the application of it, naturally coaleſces with all thoſe verbs, that denote any tendency, deſire, or volition of the ſoul, but not readily with others. See Harris's Hermes, p. 163, &c.

In moſt languages, both ancient and modern, the *infinitive* is diſtinguiſhed by a termination peculiar to it; as *τυπτειν* in the Greek, *ſcribere* in the Latin, *ecrire* in the French, *ſcrivere* in the Italian, &c. but the Engliſh is defective in this point; ſo that to denote the *infinitive*, we are obliged to have recourſe to the article *to*: excepting ſometimes when two or more *infinitives* follow each other.

The practice of uſing a number of *infinitives* ſucceſſively, is a great but a common fault in language: as, *he offered to go to teach to write* Engliſh.—Indeed, where the *infinitives* have no dependence on each other, they may be uſed elegantly enough; as *to mourn, to ſigh, to ſink, to ſwoon, to die.*

INFINITO, in the *Italian Muſic*, is uſed for ſuch canons or fugues, as may be begun again and again: whence they are alſo called *perpetual fugues*. See FUGUE.

INFINITY, the quality which denominates a thing *infinite*. The idea ſignified by the name *infinity* is beſt examined by conſidering to what things *infinity* is by the mind attributed, and how the idea firſt is framed: finite and infinite are looked upon as the modes of quantity, and are attributed primarily to things that have parts, and are capable of increaſe or diminution, by the addition or ſubtraction of any the leaſt part. Such are the ideas of ſpace, duration, and number. When we apply this idea to the Supreme Being, we do it primarily in reſpect of his duration and ubiquity: and more figuratively, when to his wiſdom, power, goodneſs, and other attributes, which are properly inexhauſtible and incomprehenſible: for when we call them *infinite*, we have no other idea of this *infinity*, but what arrives with it ſome reflection on the number, or the extent, of the acts or objects of God's power and wiſdom, which can never be ſuppoſed ſo great, or ſo many, that theſe attributes will not always ſurmount and exceed, though we multiply them in our thoughts with the *infinity* of endleſs number. We do not pretend to ſay, how theſe attributes are in God, who is infinitely beyond the reach of our narrow capacities: but this is our way of conceiving them, and theſe are our ideas of their *infinity*.

We come by the idea of *infinity* thus: every one that has any idea of any ſtated length of ſpace, as a foot, yard, &c. finds that he can repeat that idea, and join it to another, to a third, and ſo on, without ever coming to an end of his additions. From this power of enlarging his idea of ſpace, he takes the idea of infinite ſpace, or immenſity. By the ſame power of repeating the idea of any length or duration we have in our minds, with all the endleſs addition of number, we alſo come by the idea of eternity.

If our idea of *infinity* be got by repeating without end our own ideas, it may be aſked, why do we not attribute it to other ideas, as well as thoſe of ſpace and duration; ſince they may be as eaſily, and as often repeated in our minds, as the other? yet nobody ever thinks of infinite ſweetneſs, or whiteneſs, though he can repeat the idea of ſweet or white, as frequently as thoſe of yard or day? To this it is anſwered, that thoſe ideas which have parts, and are capable of increaſe by the addition of any parts, afford us by their repetition an idea of *infinity*; becauſe with the endleſs repetition there is connected an enlargement, of which there is no end: but it is not ſo in other ideas; for if to the perfecteſt idea I have of white, I add another of equal whiteneſs, it enlarges not my idea at all. Thoſe ideas, which conſiſt not of parts, cannot be augmented to what proportion men pleaſe, or be ſtretched beyond what they have received by their ſenſes; but ſpace, duration, and number, being capable of increaſe by repetition, leave in the mind an idea of an endleſs room for more; and ſo thoſe ideas alone lead the mind towards the thought of *infinity*.

We are carefully to diſtinguiſh between the idea of the *infinity* of ſpace, and the idea of a ſpace infinite. The firſt is nothing but a ſuppoſed endleſs progreſſion of the mind over any repeated idea of ſpace: but to have actually in the mind the idea of a ſpace infinite, —is to ſuppoſe the mind already paſſed over all thoſe repeated ideas of ſpace, which an endleſs repetition can never totally repreſent to it; which carries in it a plain contradiction. See SPACE.

This will be plainer, if we conſider *infinity* in numbers: the *infinity* of numbers, to the end of whoſe addition every one perceives there is no approach, eaſily appears to any one that reflects on it: but how clear ſoever this idea of the *infinity* of numbers be, there is nothing yet more evident than the abſurdity of the idea of an actual infinite number. Locke's Eſſay, vol. i. chap. xvii.

INFINITY *of action*, in *Law*; the lord of the ſoil may have a ſpecial action againſt him who ſhall dig ſoil in the king's highway: but one ſubject may not have his action againſt another for common nuiſances; for if he might, then every man might have it, and ſo the *actions* would be *infinite*, &c. 1 Co. Inſt. 56. 9 Rep. 113.

INFIRMARY, a place where the ſick and weak belonging to any ſociety, or community, are diſpoſed, either for nurſing or cure. See HOSPITAL.

INFLAMMABILITY is that property of bodies which diſpoſes them to kindle, or catch fire. See FLAME, HEAT, and PHLOGISTON.

INFLAMMABILITY *of oils with acids*. Among the many ſurpriſing phenomena which the world owes to the late improvements in chemiſtry, there is none which has more attracted the admiration of the generality of mankind than that remarkable one of producing actual flame by mixing two liquors, both cold to the touch; the acid ſpirits of minerals, and the chemical oil of vegetables. See CONJUGATION.

Becher is the firſt author who has publiſhed an account of this phenomenon. He obſerves, in his Phyſica Subterranea, that oil of vitriol which is a very ſtrong acid liquor, with oil of turpentine which is a very ſulphureous one, produces a violent heat, and actual fire or flame. Becher giving no farther account of the proceſs than this, ſeveral of the ſucceeding chemiſts tried the experiment, but all without ſucceſs. At length Borrichius (ſee Copenhagen Tranſactions for the year 1671) explained it, with all the neceſſary particulars, and the effect according to his directions has been ſometimes produced; though the great uncertainty of a thouſand little accidents, all of which muſt neceſſarily concur to the producing the flame, has made it often miſs even in the moſt careful hands. The method of Borrichius is this; mix in a glaſs veſſel four ounces of freſh drawn and highly rectified oil of turpentine, with ſix ounces of aqua fortis newly made and carefully prepared; cover the veſſel, and ſhake the two liquors well together. After they have ſtood together half an hour, open the veſſel, and there will proceed out of the mouth of it large quantities of flame mixed with great clouds of ſmoak. The experiment will not ſucceed, however, unleſs the liquors are freſh made, and the veſſel be expoſed to the heat of the ſun. And many who have failed in trying the experiment, from their neglect of certain circumſtances which appeared trifling to them, have cenſured both authors as relating untruths. Tournefort, in the year 1700, inflamed by this method the oil of ſaſſafras. Homberg, in the year 1702, ſays, in the Memoirs of the Academy, that he inflamed oil of turpentine by mixing it with nitrous acid; but he ſays, that the oil muſt be thick. Rouviere, in the year 1706, inflamed the empyreumatic oil of guyac; and his experiment was much talked of, becauſe it ſucceeded more eaſily than the others, becauſe this inflammation is very vivid, and becauſe it is attended by a ſurpriſing circumſtance, namely, that from amidſt the flames ariſes a black, thin, ſpongy body, of a conſiderable height, which is, as we ſhall ſee, only the thickeſt part of the oil rarefied and burnt during the inflammation. This inflammation of oil of guyac was ſolely attended to, and was ſhewn to ſtudents in courſes of chemiſtry and experimental philoſophy; till Hoffman, a German chemiſt, and Geoffroy, a French chemiſt, having made many experiments on this matter, diſcovered at the ſame time, that ſmoking nitrous acid, mixed with concentrated vitriolic acid, ſucceeded much better for the inflammation of oils, and particularly of the oil of turpentine, which had been almoſt relinquiſhed. Mem. Acad. Paris, 1702, and 1726.

Mr. Boulle then reſumed this ſubject, and publiſhed, in the year 1747, a memoir filled with many experiments, which ſhewed, that by nitrous acid may be inflamed all eſſential oils, including oil of turpentine, and even thoſe ſweet expreſſed oils which are capable of quickly thickening and drying, ſuch as oils of nuts, linſeed, hemp, provided that the acid be ſufficiently concentrated. Laſtly, the ſame chemiſt diſcovered, that even the ſweet oils leaſt diſpoſed to dry, that is, thoſe called *fat oils*, may alſo be inflamed. But to make their inflammation ſucceed, the method mentioned by Hoffman and Geoffroy was neceſſary; that is to ſay, ſome concentrated vitriolic acid muſt be previouſly mixed with the nitrous acid. As theſe laſt mentioned oils are of all oils the leaſt inflammable, we have reaſon to believe that every oil may be inflamed by a mixture of theſe two acids.

Mr. Boulle farther remarks, in the above quoted memoir, that flame is more certainly produced in all theſe

experi-

experiments, when the nitrous acid is poured on at intervals, and when it is applied to that part of the oil which the portions of acid firſt poured on had thickened, heated, and dried. The inflammation of oils by acids is now become an experiment eaſily performed. The following circumſtances are remarked to be peculiar to the inflammation of the ſeveral kinds of oil.

All eſſential oils, and even the ſweet drying oils, may be inflamed by the nitrous acid alone, provided that the veſſel in which the inflammation is to be made be of a convenient ſize and form, that the nitrous acid be ſufficiently concentrated, and that a ſufficient quantity of acid and oil be employed. The veſſel ought to be ſufficiently wide-mouthed; and the nitrous acid, for greater certainty, ought to be ſo concentrated that a phial, capable of containing exactly an ounce of pure water, ſhall be capable of containing one ounce, four grains, and two ſcruples of this acid. Laſtly, an ounce of this acid, and as much of the oil to be inflamed, ought to be employed, although leſs quantities may ſucceed, but leſs certainly. The oil is firſt put into the veſſel in which the inflammation is intended to be. Then the veſſel containing the nitrous acid is to be tied to one end of a rod, that the operator may not be hurt by the part of the mixture which is generally thrown out of the veſſel, and ſometimes to a conſiderable diſtance. One half or two-thirds of the acid is poured at once. A conſiderable ebullition is excited by the reaction of theſe two liquors. The oil becomes black, thick, and ſometimes inflames. If it does not inflame within four or five ſeconds, more nitrous acid muſt be poured upon the part which appears thickeſt and driеſt, and then the mixture never fails to be inflamed.

The oils of almonds, olives, ropes, and other fat oils, have not been hitherto inflamed by the nitrous acid alone. But their inflammation is effected, as Mr. Rouelle practiſes, by mixing with them firſt equal quantities of the concentrated vitriolic and nitrous acids, which occaſion leſs quick and violent ebullition than in the preceding inſtances; but when this ebullition is at its height, ſome pure nitrous acid muſt be poured on the thickeſt part of the mixture. Then the inflammation generally happens, but is leſs ſtrong than when any other kind of oil is uſed. Although theſe phenomena be ſurpriſing, their theory is eaſy. All oils contain phlogiſton as a conſtituent part. Nitrous acid alſo contains phlogiſton. Hence we may underſtand the cauſe of the powerful action of theſe two ſubſtances upon each other. The heat reſulting from their reaction is equal to that of ignition; and hence the oil and even the nitrous acid being capable of inflammation, muſt conſequently be inflamed. Chemical Dict. vol. ii. art. *Inflammation*.

INFLAMMABLE *principle*. See PHLOGISTON.

INFLAMMATION, from *in*, and *flamma*, *flame*, in *Surgery* and *Phyſic*, a tumor attended with a preternatural heat, and redneſs, and a continual pulſation and pricking; frequently ariſing from ſome obſtruction or ſtagnation in the ſmall arterial blood-veſſels or lymphatics; by means whereof the blood flowing into ſome part faſter than it can run off again, ſwells up, and cauſes a tenſion, with an unuſual fierceneſs, redneſs, and heat.

Others have defined *inflammation*, in relation to the cauſe that produces it, to be an increaſed circulation in any part, from irritation, external or internal, local or univerſal: in conſequence of which irritation, a greater quantity of fluid circulates through, and is ſecreted into a part that is inflamed, than when it is in its natural ſtate. However, nothing has been more variouſly accounted for than the proximate cauſe of *inflammation*; and in all probability, ſave an ingenious writer, it is intimately connected with theſe operations of the minuteſt parts of the body which we are at preſent, and perhaps ſhall ever remain, ignorant of. The ſymptoms of every *inflammation*, which are a painful tumor, with increaſed heat, redneſs, and ſenſibility, plainly ſhew a conteſtion of fluids, a more frequent action of the moving power, and a violent ſtate of the nerves diſpoſing them to communicate ſenſation in too great a degree. The remote cauſes of *inflammation* are wounds, bruiſes, ſudden and exceſſive cold, luxations, aromatic aliments, &c. Phyſicians have given diſtinct names to the *inflammations* of ſeveral parts; ſee the ſubſequent articles. All the *inflammations* that are denominated phlegmonous are ſeated in the ſanguine arteries of the part inflamed; and the mucous membrane is the ſeat of thoſe *inflammations* which are diſtinguiſhed by the name of *inflammations* of the mucous membrane; in which caſe, the irritation being in the ſurface of the membranes, ſtimulates the ſecretory mucous glands to accumulate and diſcharge more than they do in a natural ſtate. If there are tumors, the *inflammation* is phlegmonous; and theſe are diſtinguiſhed into phlegmonous which are ſeated in the ſanguine arteries and cellular membrane (ſee PHLEGMON); and eryſipelatous, whoſe ſeat is in the ſkin, or other internal membranes not cellular. See ERYSIPELAS.

Inflammations terminate variouſly according to their different degrees of violence, the cauſes from which they ariſe, the parts which they affect, and the particular conſtitution of the patient, with ſeveral other circumſtances that preſage what will be the end of the *inflammation*. But the ſeveral ways wherein an *inflammation* terminates have been uſually reckoned four. The firſt is reſolution; when, upon removing the cauſe, the ſymptoms go off gradually, and leave the part in the ſame ſtate in which it was before the diſeaſe took place. This is the termination which is always to be preferred, unleſs the *inflammation* has been produced by morbific matter, which is to be diſcharged externally.

The grand intention of the treatment of all *inflammations* ſhould be to open ſuch ſmall veſſels as are obſtructed, and to reſtore the blood to its natural conſiſtence and free circulation; and this is commonly termed in ſurgery the reſolution or diſperſion of tumors. When in caſes of this kind the *inflammatory* ſigns are but gentle, it is always beſt immediately to ſet about the diſperſing of the tumor. If the cauſe of the *inflammation* is external and obvious, as thorns, ſplinters, bullets, or any other foreign body ſtuck in the part, this is to be immediately removed, if that can be done with ſafety. So when the *inflammation* proceeds from too tight a bandage in wounds, &c. or from a luxation or fracture, the firſt thing to be done is to looſen the bandage, to ſet the fracture, or to reduce the luxation. It is after this very proper to open a vein in the arm, and after that to give a brisk but not heating purge: and if the ſymptoms do not abate, this method is to be repeated at proper intervals. Internal medicines which are watery, diluting, cooling, and attenuating, do great ſervice on theſe occaſions.

A proper regimen is alſo to be obſerved in regard to diet: all aliments that are of difficult digeſtion, all pickled or ſalted meats, and all ſpices and fermented liquors, with every thing elſe that may tend to heat and inflame the blood, are to be carefully avoided. The moſt proper aliments are broths, and drinks made of pearl-barley, oats, or flour. Decoctions of all the cooling plants, as ſorrel, endive, &c. mixed with ſmall quantities of lemon juice, any other of the vegetable acids, are uſeful; and when the *inflammation* is great, a little nitre ſhould be added to the drinks. Nor is there leſs care required about the external applications; for though ſome to appeaſe *inflammations* uſe only heating medicines, and others only cooling ones, yet either ſort, if applied at random, and in all caſes, may prove pernicious; for one medicine can never in theſe caſes ſerve for all conſtitutions. To perſons of a hot temperament the cooling external remedies are in theſe caſes to be applied. Of this kind are the litharge-vinegar, applied warm on linen rags folded together, or hot vinegar mixed with red-lead, or with bole armeniac, and applied in the ſame manner; or oxycrate, or vinegar, and water mixed in equal quantities; or of any of theſe liquors may be taken ſix ounces, and to this an ounce of common ſalt, and two ounces of either nitre or ſal ammoniac being added, and with this mixture linen rags many times doubled, and applied wet to the part, will be of great ſervice. In the night-time alſo, when theſe applications cannot ſo conveniently be renewed, a plaiſter of the red-lead, or other cooling one, may be of no ſmall uſe. This is the proper method in hot conſtitutions; but, on the contrary, in cold and phlegmatic ones, ſpirit of wine alone, or camphorated ſpirits, or either of theſe with an admixture of a ſmall quantity of Venice treacle, are very ſucceſsful remedies for the diſperſion of *inflammations*, being applied on linen cloths doubled in the ſame manner; to alſo is ſpirit of wine mixed with lime-water, or even lime-water alone, or Hungary water with lapis calaminaris, ceruſs, ſal ammoniac, or bole armeniac, or a mixture of a pint of rectified ſpirit of wine with two ounces of Caſtile ſoap. This laſt applied warm is hardly ſecond to any medicine in theſe intentions. Decoctions of wormwood, mint, ſavin, ſouthernwood, and other ſuch herbs, made with ſalt-water or lime-water, are alſo very good external applications; and to theſe may be added, when neceſſary, either camphorated ſpirit of wine, or Caſtile ſoap: and not only the decoction of theſe herbs, but the herbs themſelves when boiled may be applied as a cataplaſm, with great ſucceſs.

Mr. Goulard obſerves, that emollient topics are in great meaſure contrary to the indications that are to be fulfilled in reſolving an *inflammation*: they increaſe every degree of tumor, by adding to the quantity of accumulated matter, and rendering the veſſels more yielding

to

to its impulse and less able to carry it off. Saturnine topics, on the other hand, seem peculiarly calculated to answer every indication of a resolvable *inflammation*. The astringent and sedative properties combined, tend to give a tone to the fibres, and make the vessels capable of emptying themselves, and at the same time to moderate the increased motion and sensation. Other astringents and stimulants, such as the usual mixture of vinous spirit with vinegar, will likewise prove sedative. The saturnine water, by its mild astringency, its sedative and antiseptic quality, seems peculiarly adapted to that species of *inflammation* called the ERYSIPELAS. However, there are various cases in which the resolution of an *inflammation* cannot possibly be effected: and, therefore, in such cases, recourse must be had to such means as are most likely to promote a speedy and favourable SUPPURATION, which is the second mode in which an *inflammation* terminates, or rather the consequence of it. 3. An *inflammation* sometimes terminates in RAPHACELUS or GANGRENE, which is produced by a putrefaction generated in the mortified flesh, and communicating its ferment to the surrounding part. This should never be promoted by art, but its progress prevented or limited by separation of the dead flesh, or checking the putrefactive fermentation in it. For this purpose, emollients, with a proper mixture of antiseptics, should be used; practice has, therefore, rightly introduced the application of warm poultices, composed of farinaceous substances and vinegar, strong beer grounds and the like; and the cataplasm made of saturnine water appears very well calculated for this purpose. But when a spreading gangrene proceeds from an internal cause, which usually happens in dropsical and leucophlegmatic habits, or in extreme old age, emollients of every kind are to be avoided, and the warmest stimulants and most powerful antiseptics are indicated. The fourth mode in which an *inflammation* terminates, according to some writers, is a SCIRRHUS, which grows more compact in the part affected, as the *inflammation* remits or goes off. But this is justly considered by some late writers as a peculiar disease; since it seldom or never occurs but in venereal, scrophulous or cancerous cases, when it is the forerunner, and not the consequence of an *inflammation*; the tumor generally appearing before the discolouration.

It may be observed, in general, that in all phlegmonous *inflammations*, there are two indications, viz. to lessen or remove the irritation, and to abate the increased afflux of the humours. With respect to the first, endeavours must be used to remove every thing that occasions the morbid irritation: when spasms are the cause, opium is the most proper remedy; when a stimulating fluid is secreted on a sensible membrane, its action may be hindered by the application of oily, unctuous, or mucilaginous matter: the morbid acrimony may be destroyed by proper alteratives, as mercury, &c. the irritability of the part may be destroyed or diminished by means of the bark, preparations of lead, &c. The distention of the internal vessels may be rectified, by restoring the circulation on the external surface of the body, or giving internal medicines to relax the small vessels, through the system, by their action on the stomach, such as nitre, sal ammoniac, all the neutral salts, ipecacuanha, senega root, antimonial preparations, cold water, by external applications, as sinapisms, blisters, &c. The second indication may be answered by bleeding, purging with neutral salts, internal sedative medicines, as acids and narcotics, and the external application of sedatives, as the preparations of lead, &c. An *inflammation* may also be excited on the skin, if this be not the part inflamed, near the part primarily affected, by means of friction, the volatile liniment or blister; the diet should be cooling and attenuating, as already directed; and the drink barley water, in which gum arabic has been dissolved, with the addition of nitre. The belly should be kept lax in all kinds of *inflammations*, and internal ones are much relieved by a frequent use of clysters. Vapours and warm baths serve to lessen the irritation of the fibres and to retard the motion of the blood. When the *inflammation* abates, attenuants and aperients, such as guaiacum, sassafras, &c. are used with some advantage. Heister's Surgery, part i. p. 194, &c. Aikin on Lead, &c. p. 39. Motherby's Dict. art. *Inflammation*.

A late author is of opinion that the ophthalmia, angina, phrenitis, peripneumonia, pleuritis, hepatitis, nephritis and rheumatismus, have all the same characteristic, and differ in nothing but the part affected; so that if one has a right knowledge of an *inflammation* on an external part, its progress and proper remedies, and at the same time is thoroughly acquainted with anatomy and the animal œconomy, he cannot be at a loss to distinguish and treat any of the diseases belonging to this class. Medic. Ess. Edinb. vol. i.

INFLAMMATION of the *bladder* proceeds, in a great measure, from the same causes as that of the *kidneys*, and requires a similar treatment. It is known by an acute pain towards the bottom of the belly, and difficulty of passing urine, with some degree of fever, a constant inclination to go to stool, and a perpetual desire to make water. The diet must be light and thin, and the drink of a cooling nature. Bleeding is very proper at the beginning, and in robust constitutions it will often be necessary to repeat it. The lower part of the belly should be fomented with warm water, or a decoction of mild vegetables, and emollient clysters ought frequently to be administered, &c. the patient should abstain from every thing that is of a hot, acrid, and stimulating quality, and live entirely upon small broths, gruels, and mild vegetables. Buchan.

INFLAMMATION *of the breasts*. See TUMORS *of the breasts* and *Women's* MILK.

INFLAMMATION *of the diaphragm*. See PARAPHRENITIS.

INFLAMMATION *of the ear*. See OTALGIA.

INFLAMMATION *of the eye*. See OPHTHALMIA.

INFLAMMATION *of the fauces*, &c See ANGINA and QUINZY.

INFLAMMATION *of the intestines*. See ILIAC *passion*.

INFLAMMATION *of a joint*. See RHEUMATISM.

INFLAMMATION *of the kidneys*. See NEPHRITIS.

INFLAMMATION *of the liver*. See HEPATITIS and LIVER.

INFLAMMATION *of the lungs*. See PERIPNEUMONY.

INFLAMMATION *of the mediastinum, mesentery, œsophagus, pericardium*, and *peritonæum*. See these articles.

INFLAMMATION *of the pleura*. See PLEURISY.

INFLAMMATION *of the spleen*. See SPLENITIS.

INFLAMMATION *of the stomach*, called also, *gastritis* and inflammatory COLIC, proceeds from any of the causes which produce an inflammatory fever, as cold liquor drunk when the body is warm, obstructed perspiration, or the sudden striking in of any eruption: or, from the acrimony of the bile, and acrid substances taken into the stomach, as strong vomits or purges, corrosive poisons, &c. It is also occasioned by repelling the gout from the extremities; and by hard indigestible substances, as bones, the stones of fruit, &c. swallowed into the stomach. This disease is attended with a fixed pain and burning heat in the stomach; great restlessness and anxiety; a small, quick, hard pulse; vomiting, or at least a nausea and sickness; excessive thirst; coldness of the extremities; difficulty of breathing; cold clammy sweats; and sometimes convulsions and fainting fits. The stomach is swelled and feels hard to the touch; and the patient has a sense of pain when he takes any kind of food or drink, especially if it be either too hot or cold. When he vomits every thing he eats or drinks, is extremely restless, has a hiccup, with an intermitting pulse and frequent fainting fits, the danger is very great.

In this disorder all acrimonious, heating, and irritating food and drink are to be carefully avoided: and a vomit is very hurtful. The food should be light, thin, cool and easy of digestion; the drink should be clear whey, barley water, or decoctions of emollient vegetables, as liquorice and mallow roots, sarsaparilla, &c.

Bleeding is almost the only dependence, and it must be freely used, notwithstanding the lowness of the pulse, and repeated till the pulse rises. Flannel cloths dipped in lukewarm water, or a decoction of emollient vegetables, should be applied to the region of the stomach. The feet and legs ought to be frequently bathed in lukewarm water, and warm bricks or poultices applied to the soles of the feet. The warm bath is also very beneficial. In this, and all other *inflammations* of the bowels, an epispastic, or blistering plaster, applied over the part affected, is an excellent remedy, and seldom fails of giving relief. Mild clysters of warm water, or thin water gruel, with the addition of a little sweet oil, honey, or manna, when the patient is costive, should be frequently administered, and are of very great importance. Buchan's Dom. Med. p. 314, &c.

INFLAMMATION *of the testicles*. See HERNIA *Humoralis* and *Tumors of the* TESTICLES.

INFLAMMATION *of the throat*. See ANGINA and QUINZY.

INFLAMMATION *of the tonsils*. See TONSILS.

INFLAMMATION *of the vagina*. See VAGINA.

INFLAMMATION *of the womb* is a disorder to which women after child-birth, when the LOCHIA are impeded, are most frequently subject: the common causes of this complaint, besides those of internal *inflammations* in general, are tearing, bruises, external stimuli, and obstructed menstrua or lochia. When it happens after abortion and child-birth, it is attended with a pain at the bottom of the belly, which is neither throbbing nor constantly acute; a frequent pulse, often small, sometimes irregular, and in strong habits and after early abortions, hard; a delirium

a delirium, subsultus tendinum, and other symptoms of irritation: the womb gangrenes and mortifies, and the patient sinks. But if the uterus has not been lately impregnated, the pain is more constant, bounded and throbbing; the pulse is hard, full, and strong, and accompanied with other symptoms of general *inflammation*; and if the disease increases, the pulse is small and frequent, the symptoms of irritation attend, and suppuration is more likely to happen. In both, as different parts of the womb are affected, there is a stranguary or a suppression of urine; the small quantity discharged is fetid and hot; a tenesmus attends with a pain in going to stool: or, there is pain in moving the lower extremities, or swelling, with heat, to be felt by introducing a finger up the vagina, the os uteri being shut; universal restlessness, thick urine, pain upon external pressure; the belly is tense; a red stain extends up to the navel and turns black when fatal; and if it happens in an impregnated uterus, an abortion follows. It often happens that the woman can only lie on her back, and on turning to either side, she feels a painful heavy mass fall to that side, and at the same time an excessive pain in the loins, kidneys, and groin of the opposite side. This disorder may be removed by a spontaneous eruption of the menses, or of the lochia; or, after an abortion or child-birth, by a confluent, gentle, and long continued sweat: or, it may terminate in an abscess or a mortification, both which are almost always fatal. When an *inflammation* attacks a womb not lately impregnated, the common remedies used in cases of internal *inflammation* are to be employed. If abortions and labours, when the patient hath not been much weakened, and the pulse is hard and not very frequent, bleeding in the arm may be beneficial, but can rarely be repeated: therefore the general method of cure will depend on relaxants, such as the antimonial powder and saline draught, moderately used. To which may be added anodyne and antispasmodic fomentations and poultices. Perspiration may be free; the other usual evacuations by urine and stool may be moderately promoted; but all extraordinary ones are dangerous. If the pain continues, notwithstanding the usual treatment, opiates may be sometimes given with success. If a suppuration comes on, an exit for the pus should be procured as soon as possible, which, when it points to the perinæum, may be sometimes obtained. Motherby.

INFLAMMATORY *diseases*. To these are to be referred coughs, pleurisies, peripneumonies, acute rheumatisms, inflammations of the brain, bowels, and other parts, attended with a fever; also some inflammations without a fever, and fevers of an *inflammatory* kind, where no part is so peculiarly affected as to give name to the disease. And, lastly, all chronic disorders arising from inflammations, whereof the chief are old coughs, consumptions, and the rheumatism without a fever. See the preceding articles and references.

All these diseases are the consequences of catching colds, and are prevented by the same means as colds. See COLD.

Bleeding is the most indispensable remedy in the cure of all *inflammatory* diseases, and therefore to the delaying this too long, or not repeating it, it is owing, that colds end in dangerous fevers, rheumatisms, or consumptions. See BLEEDING.

In all *inflammatory* disorders, the principal intention of cure is to diminish the force of the blood, to thin it, and to relax the fibres; on which account, bleeding, attenuants, and diaphoretics, are the chief remedies. Physicians have generally supposed, that the increased action of the blood-vessels in *inflammatory* diseases increases the tendency of concretion in the crassamentum. But Mr. Hewson has advanced a new doctrine, which has also been adopted by Dr. George Fordyce, in his Elements of the Practice of Physic, viz. that inflammation instead of increasing, lessens the disposition of the blood to coagulate, and instead of thickening, thins it, at least its coagulable part; the surface of blood which is about to form a crust or size, remaining much longer fluid than that of blood in different circumstances; and he supposes that what floats on the surface of such blood is coagulable lymph, attenuated by the increased action of the blood-vessels. Phil. Trans. vol. lx. p. 330.

An early sweat tends also to prevent an *inflammatory* fever; for which purpose, the diaphoretic draught of the Edinburgh dispensatory is recommended; or, instead of it, a spoonful of the plain spiritus Mindereri may be given every two hours, till a sweat breaks out; or two scruples of the salt of hartshorn, saturated with about three spoonfuls of common vinegar, may be given in one draught at bed-time. Pringle, Observ. on the Diseases of the Army, p. 73. 77. 127. seq.

INFLAMMATORY *fevers*. See *ardent* or *inflammatory* FEVER.

INFLATION, formed from *in*, and *flatus*; of *flo*, *I blow*; *blowing up*, the act of stretching or filling any flaccid, or distensible body, with a flatulent or windy substance.

INFLECTION, called also *diffraction*, and *deflection*, in *Optics*, is a property of light, by reason of which, when it comes within a certain distance of any body, it will either be bent from it, or towards it; which is a kind of imperfect reflection or refraction.

This property was first taken notice of by Dr. Hooke; who shews that it differs both from *reflection* and *refraction*; and seems to depend on the unequal density of the constituent parts of the ray, whereby the light is dispersed from the place of condensation, and rarefied or gradually diverged into a quadrant: and this deflection, he says, is made towards the superficies of the opake body perpendicularly. Some writers ascribe the first discovery of it to Grimaldi, the Jesuit. He first published an account of it, in his treatise De Lumine, Coloribus, & Iride, printed in 1666; nor did any other person lay claim to the discovery, except Dr. Hooke, who communicated his observations on this subject to the Royal Society, in 1672. It appears, however, that Dr. Hooke had not heard of the discoveries of Grimaldi; for he speaks of his own, as a discovery of a new property of light, not mentioned by any optical writer before him. See DIFFRACTION.

Sir Isaac Newton discovered also, by plain experiment, this *inflection* of the rays of light; and M. de la Hire assures us he found, that the beams of the stars being observed, in a deep valley, to pass near the brow of a hill, are always more refracted than if there were no such hill, or the observations were made on the top thereof; as if the rays of light were bent down into a curve, by passing near the surface of the mountain.

Sir Isaac Newton, in his Optics, makes several experiments and observations on the *inflection* of the rays of light; which see under LIGHT, and RAY.

M. de la Hire observed, that when we look at a candle, or any luminous body, with our eyes nearly shut, rays of light are extended from it, in several directions, to a considerable distance, like the tails of comets. The true occasion of this phenomenon, which has exercised the sagacity of Des Cartes, Rohault, and others, seems to be, that the light passing among the eye lashes, in this situation of the eye, is inflected by its near approach to them, and therefore enters the eye in a great variety of directions.

INFLECTION, in *Grammar*, the variation of nouns, verbs, in their several cases, tenses, and declensions. *Inflexion* is a general name, under which are comprehended both CONJUGATION and DECLENSION.

INFLECTION, *point of*, of a curve, in *Geometry*, is a point or place where the curve begins to bend, or turn its contrary way.

If a curve line, as A F K *(Tab. III. Geometry, fig. 33)*, be partly concave, and partly convex towards any right line, as A B, or towards a fixed point; the point F, which divides the concave from the convex part, and consequently is at the beginning of the one and end of the other, is called the *point of inflection*, as long as the curve, being continued beyond F, keeps its course the same: when it returns back again towards that part or side, from whence it took its original, it is called the *point of retroflexion*. See the article RETROGRESSION.

To conceive this, it is to be considered, that any quantity which goes on continually increasing or decreasing, cannot change from a positive to a negative expression, or from a negative to a positive one, without first becoming equal to an infinite, or nothing. It becomes equal to nothing, if it continually decrease; and equal to an infinite, if it continually increase.

Now, if through the point F be drawn the ordinate E F, and the tangent F L, and from any point, as M, on the same side of A F, be drawn the ordinate M P, and the part A T of the diameter, intercepted between the vertex of the diameter and the tangent M T, increases also, till the point P falls into E; after which it again begins to diminish: whence the line A P must become a maximum A E, when the point P falls into the point E.

In those curves which have a point of retrogression, the part A T increases continually, and the abscis increases, till the point T falls into L; after which it again diminishes: whence A P must become a maximum, when the point T falls into L.

If A E $= x$, E F $= y$, then will A L $= \frac{yx}{y} = x$ (sec TANGENT) whose FLUXION, which is $\frac{\dot{y}x - y\dot{x}}{\dot{y}} = \dot{x}$

$\frac{\dot{y}x - y\dot{x}}{\dot{y}} = \frac{\dot{y}x}{\dot{y}}$ supposing x constant, being divided by $\dot{x}$, the fluxion of A L must become nothing; i. e.

i. e. $\frac{-\dot{y}\dot{y}}{y^3}=0$: ſo that multiplying by y^3, and dividing by $-\dot{y}$, $\dot{y}=0$: which is a general form for finding F, the *point of inflection*, or retrogreſſion, in thoſe curves whoſe ordinates are parallel to one another. For the nature of the curve AFK being given, put the equation of the curve into fluxions; from which, or from other properties of the curve, find the value of $\dot{x}$ or $\dot{y}$, and put this $\dot{x}$ or $\dot{y}$ and its value into fluxions, making both $\dot{x}$ and $\dot{y}=0$: then by expunging the reſt of the fluxional quantities, we ſhall determine the value of x, i. e. AE or y, i. e. EF, at the point of *inflexion* ſought.

E. gr. To find the point of *inflection* B in the curve ABY (*ſee* 54.) whoſe equation (putting the abſciſs AC $=x$, ordinate CB $=y$, and the perpendicular AE $=a$) is $a^3=a^2y+x^2y$. From the fluxion of this equation, viz. $2a\dot{x}a=a^2\dot{y}+2x\dot{x}y+x^2\dot{y}$ we deduce $\dot{y}=\frac{2a\dot{x}x-2x\dot{x}y}{a^2+x^2}$ i. e. by ſubſtituting for y its value $\frac{ax^3}{a^2+x^2}$, $\dot{y}=\frac{2a^3\dot{x}x}{a^2+x^2}$, and the fluxion of this equation, making both $\dot{x}$ and $\dot{y}=0$, is $0=\frac{2a^3\dot{x}^2\times a^2+x^2)^2-4a^2\dot{x}x+4x^2\dot{x}\times 2a^2\dot{x}x}{a^2+x^2)^3}$ which multiplied by $a^2+x^2)^2$ and divided by $2a^2\dot{x}^2$, gives $0=a^4+x^4)-4a^2x^2-4x^4$; therefore, $4x^4+4a^2x^2=a^4+x^4)$; which equation divided by x^2+a^2 makes $4x^2=a^2+x^2$; therefore $3x^2=a^2$, and $x=a\sqrt{\frac{1}{3}}$; and if this value be ſubſtituted for it in the given equation of the curve, we ſhall have y, or the ordinate at the point of inflection $=\frac{a\times a^2}{a^2+a^2}=\frac{3}{a^2+a^2}=\frac{a^3}{3}\div\frac{3}{3}$ $\frac{3a^3}{12a^2}=\frac{3a^3}{12a^2}=\frac{1}{4}a$. Let AC be equal to $\frac{1}{2}$ AE, and with the radius $\frac{1}{2}$E, deſcribe the arc EC; then will C be the point from which the ordinate to the point of *inflection* muſt be drawn: for $\frac{1}{2}C=\frac{1}{2}a$; and $C^2-\frac{1}{4}A^2=AC^2$, i. e. $\frac{1}{4}a^2-\frac{1}{4}a^2=\frac{1}{4}a^2=AC^2=x^2$; or $x=a\sqrt{\frac{1}{4}}$.

In order to know whether any curve be concave or convex towards any point aſſigned in the axis, find the value of y at that point; then if this value be poſitive, the curve will be convex towards the axis, and if it be negative, it will be concave. For other methods of determining the point of *inflection* in different curves, ſee Simpſon's Fluxions, vol. i. p. 65. Rowe's Introduction, &c. part i. chap. 5. The rule for determining the points of contrary flexure and retrogreſſion of curves, which ſuppoſes the ſecond fluxion of the ordinate to be nothing or infinite, i. e. $\ddot{y}=0$, or ∞, is liable to ſeveral exceptions, as is ſhewn very fully and clearly by Mr. Maclaurin, in his Treatiſe of Fluxions, book i. chap. 9. book ii. chap. 5. art. 866 and 867.

The ordinate y paſſes through a point of contrary flexure, when, the curve being continued on both ſides of the ordinate, y is a maximum, or minimum. But this does not always happen when $\dot{y}=0$, or ∞. Mr. Maclaurin obſerves, in general, that if $\dot{y}$, $\ddot{y}$, $\dddot{y}$, &c. vaniſh, the number of theſe fluxions being odd, and the fluxion of the next order to them having a real and finite value; then y paſſes through a point of contrary flexure; but if the number of theſe fluxions that vaniſh be even, it cannot be ſaid to paſs through ſuch a point; unleſs it ſhould be allowed that a double infinitely ſmall flexure can be formed at one point.

The curve being ſuppoſed to be continued from the ordinate y, on both ſides, if y be infinite, the extremity of the ordinate therefore is not always a point of contrary flexure, as y is not always, in this caſe, a maximum, or minimum; and the curve may have its concavity turned the ſame way on both ſides of the ordinate. But theſe caſes may be diſtinguiſhed by comparing the ſigns of y on the different ſides of the ordinate; for when theſe ſigns are different, the extremity of y meeting the curve is a point of contrary flexure.

The ſuppoſitions $\dot{y}=0$, or ∞, and of $\ddot{y}=0$, or ∞, ſerve to direct us where we are to ſearch for the maxima and minima, and for points of contrary flexure; but we are not always ſure of finding them. For though an ordinate or fluxion that is poſitive, never becomes negative at once, but by increaſing and decreaſing gradually, yet after it has decreaſed till it vaniſh, it may thereafter increaſe, continuing ſtill poſitive; or after increaſing till it becomes infinite, it may thereafter decreaſe without changing its ſign.

INFLUENCE, a quality ſuppoſed to flow from the bodies of the ſtars, either with their heat, or light, to which aſtrologers vainly attribute all the events which happen on the earth.

Alchemiſts, alſo, who to this aſcribe the philoſophers ſtone, tell us, that every thing in nature is produced by the *influences* of the ſtars, which in their paſſage through the atmoſphere, imbibe many of its moſt parts, the groſſeſt whereof they depoſit in the ſands and earths where they fall; that theſe, filtrating through the pores of the earth, deſcend even to the centre, whence they are driven by the central fire back again to the ſurface; and in their aſcent by a natural kind of ſublimation, as they find earths duly diſpoſed, they form natural bodies, as metals, minerals and vegetables, &c. Thus, it is pretended, that chemiſtry, conſiſting of an artificial imitation of theſe natural operations, and in applying active principles to paſſive principles, can form natural bodies, make gold, &c. See TRANSMUTATION, and PHILOSOPHERS STONE.

INFLUENT, a term uſed where a liquor or juice, by the contrivance of nature, and the laws of circulation, falls into any current or receptacle.

Thus with reſpect to the common receptacle, the chyle is its *influent* juice; and ſo is the bile to the gall-bladder; the venal blood to the heart in its diaſtole; and the like.

INFLUENT *fever* is ſometimes uſed for a *nervous* FEVER. In this the warm regimen is thought uſeful by ſome, as low cooling drinks are in the effluent or inflammatory *fever*.

INFORCED. } See { REINFORCED.
INFORCEMENT. } { REINFORCEMENT.

IN FORMA PAUPERIS, in *Law*. *See* FORMA *Pauperis*.

INFORMATION, in *Law*, for the king, is much the ſame with what is called DECLARATION for a common perſon: it is not always done directly by the king, or his attorney, or the clerk of the crown-office, but ſometimes by another, who ſues as well for the king as himſelf, on a breach of ſome penal law or ſtatute, wherein a penalty is given, one part to the uſe of the king and another to the uſe of the informer. And it differs from an indictment, which is found by the oaths of twelve men; and is only the allegation of the officer who exhibits it. The latter ſort of *informations*, which are partly at the ſuit of the king, and partly at that of a ſubject, is a ſpecies of *qui tam* actions, ſo called becauſe they are brought by a perſon, *qui tam pro domino rege, &c. quam pro ſeipſo in hac parte ſequitur*, and carried on by a criminal ſuit and a civil proceſs. By 31 Eliz. c. 5. no proſecution of this kind can be brought by any common informer, after one year is expired ſince the commiſſion of the offence; nor out of the county were the offence was committed; nor on behalf of the crown after the laſpſe of two years longer; nor, where the forfeiture is originally given to the king alone, can ſuch proſecution be had after the expiration of two years from the commiſſion of the offence. It is alſo enacted by 18 Eliz. c. 5. that if any perſon, informing under pretence of any penal law, makes any compoſition without leave of the court, or takes any money or promiſe from the defendant to excuſe him, he ſhall forfeit ten pounds, ſtand two hours on the pillory, and be for ever diſabled to ſue on any popular or penal ſtatute. And by the ſame ſtatute, if a perſon exhibits his *information* only for vexation, the defendant may bring *information* againſt the informer.

Informations that are exhibited in the name of the king alone are of two kinds; thoſe which are truly and properly his own ſuits, and filed *ex officio* by his own immediate officer, the attorney-general; and thoſe, in which, though the king is the nominal proſecutor, yet it is at the relation of ſome private perſon or common informer; and they are filed by the king's coroner and attorney in the court of king's bench, uſually called the maſter of the crown-office, who, for this purpoſe, is the ſtanding officer of the public. The objects of the king's own proſecutions, filed *ex officio* by his own attorney-general, are properly ſuch enormous miſdemeanors as particularly tend to diſturb or endanger his government, or to moleſt or affront him in the regular diſcharge of his royal functions. The objects of the other ſpecies of *information* are any groſs and notorious miſdemeanors, riots, batteries, libels, and other immoralities of an atrocious kind. And when an information is filed, in either of theſe ways, it muſt be tried by a petit jury of the county where the offence ariſes; after which, if the defendant be found guilty, he muſt reſort to the court for his puniſhment. Theſe *informations* of every kind are confined by the conſtitutional law to mere miſdemeanors only, without extending to any capital offence. The oppreſſive uſe of *informations* by the court of Star-chamber, &c. in the times preceding the Revolution, occaſioned a ſtruggle ſoon after the acceſſion of king William, to pro-

cure a declaration of their illegality by the judgment of the court of king's bench. But sir John Holt, who then presided there, and all the judges, were clearly of opinion, that this proceeding was grounded on the common law, and could not then be impeached. However, in a few years afterwards, it was enacted by 4 and 5 W. and M. c. 18. that the clerk of the crown should not file any information without express direction from the court of king's bench: and that every prosecutor, permitted to promote such *information*, shall give security by a recognizance of twenty pounds, to prosecute the same with effect; and to pay costs to the defendant, in case of his acquittal, unless the judge, who tries the *information*, shall certify there was a reasonable cause for filing it: and at all events, to pay costs, unless the *information* shall be tried within a year after issue joined. But there is a proviso in this act, that it shall not extend to any other *informations* than those which are exhibited by the master of the crown office: and, consequently, *informations* at the king's own suit, filed by his attorney-general, are no way restrained thereby.

There is one species of *informations* still farther regulated by 9 Ann. c. 20. viz. those in the nature of a writ of *quo warranto*, which is a remedy given to the crown against such as had usurped or intruded into any office or franchise. The modern *information* tends to the same purpose as the ancient writ, being generally made use of to try the civil rights of such franchises; though it is commenced in the same manner as other *informations* are, by leave of the court or at the will of the attorney-general, being properly a criminal prosecution, in order to fine the defendant for his usurpation, as well as to oust him from his office: yet usually considered at present as merely a civil proceeding.

An *information* on behalf of the crown, filed in the exchequer by the king's attorney-general, is a method of suit for recovering money or other chattels, or for obtaining satisfaction in damages for any personal wrong committed in the lands or possessions of the crown. The most usual *informations* are those of *intrusion* and *debt*; the former being for any trespass committed on the lands of the crown, as by entering thereon without title, holding over after a lease is determined, taking the profits, cutting down timber, or the like; and the latter upon any contract for monies due to the king, or for any forfeiture due to the crown upon the breach of a penal statute. There is also an *information in rem*, usually filed in the exchequer, where any goods are supposed to become the property of the crown, if no man appears to claim them, or to dispute the title of the king. There is also another *information* filed *ex officio* by the attorney-general in the court of chancery, at the relation of some *informant*, called the relator, for the proper establishment of charities, of which the king has the general superintendance. Blackst. Comm. b. iii. p. 261. 427. b. iv. p. 135 402, &c.

INFORMATUS *non fum*, or *Non fum* INFORMATUS, a formal answer made of course by an attorney, who is commanded by the court to say any thing he thinks good in behalf of his client; who having nothing material to urge, makes answer, He is not informed: on which judgment passes for the other party.

INFORMER, *informator*, in *Law*, a person that informs against, or prosecutes in any of the king's courts those that offend against any law or penal statute. See INFORMATION.

INFORMIS, *informed*, that which has not the form or perfection it should have.

INFORMES *Stellæ*, in *Astronomy*, are such stars as have not yet been reduced to any constellation; otherwise called *sporades*.

Of this kind there was a great number left by the ancient astronomers, but Hevelius and some others of the moderns, have provided for the greater part of them by making new constellations.

INFRACTION, formed of *in*, and the supine of *frango*, *I break*, a rupture, or violation of a treaty, law, ordinance, or the like.

INFRALAPSARII, the name of a sect of Predestinarians, who maintain, that God has created a certain number of men only to be damned, without allowing them the means necessary to save themselves, if they would; and they are thus called, because they hold that God's decrees were formed *infra lapsum*, after his knowledge of the fall, and in consequence thereof; in contradistinction to the SUPRALAPSARIANS.

INFRASPINATUS, called also *Infrascapularis*, a muscle which arises from the inferior parts of the basis, spine, and under-costa of the scapula, and which, filling the lower interscapulum, passes on between the spine and teres minor, in a triangular form; and, growing tendinous at the cone, is inserted into the head of the humerus, and draws directly backwards.—See *Tab. Anat. (Myol.) fig. 7 n. 13.*

INFRIGIDANS, a term used by some of the writers in medicine, to express the cessate of roses.

INFULA, a name anciently given to one of the pontifical ornaments worn on the head. Festus tells us, that the *infulæ* were filaments or fringes of wool, covering that part of the head where the hair grows as far as the temples, whence, on each side, hung down two strings called *vittæ*, for binding it, wherewith the ancients used to adorn their priests, their victims, and even their temples. The *infula* was the same thing to priests that the diadem was to kings; viz. the badge of their dignity and authority. The difference in shape between the diadem and the *infula* consisted in this, that the diadem was flat and broad, and the *infula* was rounded and twilled.

INFUNDIBULIFORM *Flowers*. See FLOWERS.

INFUNDIBULUM, a Latin word, signifying a *funnel*; whence divers parts in the human body, having a resemblance thereto in shape, are called by the same name. Such e. gr. are, the *infundibulum cerebri*, and *infundibulum renum*. See BRAIN, and KIDNEYS.—See also *Tab. Anat. (Osteol.) fig. 5. lit. c.*

Hence also certain parts of plants are called *infundibuliformes*.

The word *infundibulum* is also used by the metallurgic writers to signify a vessel of a conic shape, used to pour a melted metal out of the crucible into.

INFUSION, *in Pharmacy*, an operation whereby the virtues of plants, roots, and the like, are drawn out, by letting them steep in some convenient fluid menstruum, without boiling them therein; since boiling is found to dissipate the finer parts of many bitter and aromatic substances, without carefully extracting their medicinal principles.

Infusion is used in bodies of a lax texture, whose parts are so light as not to admit of a greater motion without hazard of flying away in vapour.

Its chief use is to communicate the virtues of bodies to liquors, either in order to regulate their force, or correct their ill qualities.

Some *infusions* are made in common water, others in wine, vinegar, milk, spirit of wine, &c.

The *bitter infusion* is prepared by cutting the tops of the lesser centaury and camomile flowers, of each half an ounce, and the yellow rind of lemon and orange peel, of each two drams, in small pieces, and infusing them in a quart of boiling water. A tea-cupful of this may be taken twice or thrice a day for indigestion, weakness of the stomach, or want of appetite.

Infusion of the bark, is made by infusing an ounce of powder in a pint of boiling water, with the addition of one or two spoonfuls of brandy, for two or three days. In disorders which require the bark, a tea-cupful of this may be taken two or three times a day.

Infusion of cardduus, is made by infusing an ounce of the dried leaves of cardduus benedictus in a pint of common water, for six hours, without heat, and then filtering the liquor through paper. This *infusion* which may be flavoured at pleasure, with cinnamon, or other aromatics, may be beneficially used in weakness of the stomach, where the common bitters do not agree.

Infusion of linseed, is prepared by infusing two spoonfuls of linseed, and half an ounce of liquorice-root sliced in three pints of boiling water by the fire for some hours, and then straining off the liquor. The pectoral *infusion* is made by adding to these ingredients an ounce of the leaves of colts-foot. These emollient liquors may be taken in difficulty of making water, and in coughs, and other complaints of the breast.

Infusion of roses, is made by infusing half an ounce of red roses, dried, for four hours in a quart of boiling water, in an unglazed earthen vessel; afterwards pouring in half a dram of the vitriolic acid, called oil of vitriol, straining the liquor, and adding to it an ounce of loaf sugar. A tea-cupful of this astringent *infusion* may be taken every three or four hours in an excessive flow of the menses, vomiting of blood, and other hæmorrhages. It will likewise serve as a very good gargle.

Infusions of tamarinds and sena, is prepared by infusing for four or five hours one ounce of tamarinds, and sena and cryftals of tartar, of each two drams, in a pint of boiling water; straining the liquor, and adding to it an ounce or two of the aromatic tincture. Persons who are easily purged, may leave out either the tamarinds or the cryftals of tartar. A tea-cupful of this agreeable cooling purge may be taken every half hour till it operates.

Spanish *infusion* is made by infusing an ounce of Spanish juice cut into small pieces, and three drams of salt of tartar in a quart of boiling water for a night; and adding to the strained liquor an ounce and a half of the

syrup of poppies. In recent colds, cought, and obstructions of the breast, a tea-cupful of this *infusion* may be taken with advantage three or four times a day. See LIQUORICE.

An *infusion* for the palsy may be made by infusing horse-radish-root thaved, mustard-seed bruised, of each four ounces; and one ounce of the outer rind of orange-peel, in two quarts of boiling water, in a close vessel, for twenty-four hours. A tea-cupful of this warm stimulating medicine may be taken three or four times a day, in paralytic complaints. It excites the action of the solids, proves diuretic, and, with warmth, promotes perspiration. If two or three ounces of the dried leaves of marsh-trefoil be used instead of the mustard, we shall have the anti-scorbutic *infusion*. Buchan's Dom. Med. Appendix.

INFUSION is also used to signify the action of conveying liquor into the body by the veins. See INJECTION.

Some physicians have found out a new method of purging, by *infusing* a cathartic into the veins, which operates pretty much after the manner of a clyster.

INGA, in *Botany*. Its characters are these: the flower has a permanent empalement divided into five parts at the top; it has one petal, is funnel-shaped, and cut into five fringed segments at the brim, out of which arise a great number of stamina, which are three times the length of the tube; at the bottom of the tube is situated an oblong germen, which becomes a fleshy pod, including several irregular seeds. There are two species, natives of the West Indies. Miller.

Linnæus has joined this genus to the MIMOSA.

INGANNO, in the *Italian Musick*, is used when the composer, after having done every thing proper for making a close or cadence, instead of so doing places a mark of silence in the place of the final note. This word is Italian signifying *deceit*.

INGEMINATED *Flowers*, are those where one flower stands on, or naturally grows out of, another; called also proliferous flowers.

INGENDRING. See ENGENDERING.

INGENITE, *Inbora*, signifies any disease, or habit, which comes into the world with a person; nearly the same with HEREDITARY.

INGENUITAS *regni*, anciently signified the freeholders and commonalty of the kingdom: the title was also sometimes given to the barons and lords of the king's council.

INGENUOUS, *Ingenuus*, among the Romans, a title applicable to a person born FREE, or of free parents.

Hodore Sapa, they are called *ingenui, qui libertatem habent in genere non in facto*; those who are born free, not those who acquire their freedom.

A person was accounted *ingenuus*, if only the mother were free, and the father a slave.

These could give their votes, and enjoy offices from which the *liberti*, or freedom, &c. were debarred.

INGENUOUS is sometimes also used to signify a NATIVE of a country in contradistinction to a foreigner.

INGESTA is used by some authors to express all sorts of aliment taken into the body.

INGINEER, or ENGINEER. See ENGINEER.

INGLUVIES. See CRAW.

INGOT, a mass, or lump of GOLD or SILVER, from the mines, melted down and cast in a sort of mould, but not coined, or wrought.

The word seems formed from the French *lingot*, which signifies the same.

INGOT is also a name given to the moulds or cavities, wherein they cast melted metals, or regulus of semimetals.

INGRAFTING, or ENGRAFTING. See ENGRAFTING.

INGRAILED. See ENGRAILED.

INGRAVING, or ENGRAVING. See ENGRAVING.

INGREDIENTS, all the simples which go into the composition of any medicine, ointment, sauce, or the like.

INGRESS, in *Astronomy*, the sun's entering the first scruple of one of the four cardinal signs, especially Aries.

INGRESS, EGRESS, and REGRESS, in *Law*, are words in cases of land, signifying a free entry into, a going out of, and returning from some part of the premises leased to another; as to get in a crop of corn, &c. after the term expired.

INGRESSU, in *Law*, a writ of ENTRY, whereby a person seeks entry into lands or tenements. It lies in various cases, and has various forms. It is also called *PRECIPE quod reddat*.

INGROSSATOR *magni rotuli*, is the same as CLERK *of the pipe*.

INGROSSER, or ENGROSSER, in *Common Law*, is one who buys up corn growing, or any provisions by wholesale, before the market, to sell again. See FORESTALLING.

It also signifies a clerk, who writes records, or instruments of law, on skins of parchment. See ENGROSSING.

INGROSSING *of a fine*, is the making the indentures by the CHIROGRAPHER, for delivery of them to the party to whom the fine is levied.

INGUEN, that part of the body, reaching from the head of the thigh to above the secret parts; commonly also called the groin, and by anatomists pubes.

The word is pure Latin, and is derived, according to some, from *unguen, ointment*; because these parts are frequently anointed. Others derive it from *ango*, because pains happen frequently there; and others again from *ingenero*, because the genital parts are here.

INGUINAL *glands*. See GLANDS.

INGUINAL *ligament*. This, which has been also called from its discoverer *ligamentum* FALLOPII, is an aponeurotic, or ligamentary band, fastened by one end to the anterior and superior part of the os ilium, and by the other to the spine of the os pubis. The middle portion of it is very narrow, but it expands considerably towards both its extremities. It is closely joined to the muscles of the abdomen, and to the aponeurotic fascia of the thigh, but seems to be often wanting.

INGUINALIS, an appellation given to any subdivisions made of the *inguen*; or any thing therein contained, or applied thereto by way of medicine, or the like.

INGUINALIS, *hernia*. See HERNIA and BUBONOCELE.

INHARMONICAL *relation*, in *Musick*. See RELATION *inharmonical*.

INHERENCE, in *Philosophy*, is applied to the juncture or connexion of an accident with its substance.

Thus quantity has a necessary *inherence* in a natural body.

INHERITANCE, *Hæreditas*, a property in lands and tenements, to a man and his heirs.

Inheritance is not only understood where a man hath *inheritance* of lands and tenements by descent or heritage; but every fee-simple or fee-tail, that a man hath by his purchase, may be said to be an *inheritance*, for that his heirs may inherit it after him. The *inheritances* mentioned in our law are either corporeal or incorporeal; the corporeal relate to houses, lands, &c. that may be touched or handled; and the incorporeal are rights issuing out of, annexed to, or exercised with corporeal *inheritances*, as advowsons, tithes, annuities, offices, commons, franchises, &c. There is likewise another *inheritance* denominated several, that is, where two or more hold lands severally; as when two persons hold to them and the heirs of their two bodies, in which case these two have joint estate during their lives, but their heirs have several *inheritances*. Goods and chattles cannot be turned into an *inheritance*. For the rules of *inheritance*, see DESCENT *collateral*.

INHIBITION, a writ to inhibit or forbid a judge from farther proceeding in a cause depending before him.

Sometimes *prohibition* and *inhibition* are put together, as of the same import; but *inhibition* is most commonly a writ issuing out of a higher court-christian to a lower; and PROHIBITION out of the king's court to an inferior court.

INHOC, or INHOKE, in our *Old Writers*, is used for any corner or part of a common field ploughed up and sowed with oats, &c. and sometimes fenced in with a dry hedge, in that year wherein the rest of the same field lies fallow and common. It is called in the North of England an *intack*, and in Oxfordshire a *hitchin*. And no such *inhoke* is now made without the joint consent of all the commoners, who in most places have their share by lot in the benefit of it, except in some manors where the lord has a special privilege of so doing. Kennet's Paroch. Antiq. 297, &c. and his Glossary.

The word is Saxon, compounded of *in*, *within*, and *hoke*, a *corner*.

INHUMATION. See BURIAL, and INTERMENT.

INHUMATION, in *Chemistry*, a method of digesting substances together, by burying the vessel, in which they are put, in horse-dung, or in a dry sandy earth exposed to the sun. See DIGESTION.

INJECTION, in *Pharmacy*, any liquid medicine made to be injected or thrown into the body, or any of its parts, by a syringe, clyster-pipe, or other instrument.

INJECTION, or INJECTING, in *Surgery*, the throwing in some liquor or medicine into a vein opened by incision. This practice, and that of TRANSFUSION, of the conveying the arterial blood of one man, or other animal, into another, were once greatly practised, but are now laid aside.

The method of *injecting* is this; a vein is to be opened in the arm with a lancet as in bleeding, and the small pipe of a syringe being introduced at the orifice, the liquor intended to be mixed with the blood, and contained for that purpose in the body of the syringe, is to be forcibly *injected*, or thrown into the vein upwards, or toward the heart; which done, the orifice is to be secured with compresses and bandage, as in bleeding.

Whether

Whether this practice of injecting proper medicines into the blood may not be found of use in apoplexies, quinsies, hydrophobia, &c. is worthy to be tried by repeated experiments. The method of *injecting* liquors into the blood of living animals, is said to be the invention of Sir Christopher Wren. His method was by making ligatures on the veins, and opening them on the side of the ligature towards the heart; then putting into them small syringes or quills fastened to bladders, in the manner of clyster-pipes, containing the matter to be *injected*. Mr. Boyle soon made the experiment upon dogs, with infusions of opium and crocus metallorum; all which he circumstantially described, in his Usefulness of Experimental Philosophy, part ii. eff. 2. Phil. Transf. N° 7. p. 128.

The ingenious Dr. Hales made a variety of experiments of this kind on different animals. See his Statical Essays, vol. ii. passim.

Many disorders of particular parts are no way curable, unless the parts affected are *injected* with a proper liquor, by means of a syringe and proper tube. The method of performing this is too obvious to need any directions; but these general cautions are necessary in regard to it, that the syringe or tube be applied tenderly and carefully to the parts, especially in very sensible or nervous parts, to avoid giving the patient any pain; and that the liquor to be *injected* be neither too hot nor too cold.

In ulcerations and inflammations of the uvula, tonsils, and fauces, *injections* are generally useful; but care must be taken to press down the tongue with a spatula, or with the flat end of a spoon, and having introduced the syringe two or three fingers breadth into the mouth, the *injection* is to be carefully and gently thrown in at several times. In gonorrhœas, *injections* are often necessary, to allay the heat and sereness of the urethra, and to wash out the matter. The fabell and best *injections* on this occasion, are warm milk, and barley-water, sweetened with sugar, honey, or syrup of marshmallows; and towards the end a little saccharum saturni, dissolved in plantane water. Heister's Surgery, p. 317.

INJECTION, *anatomical*, is used for the operation of filling the vessels with coloured wax, or any other proper matter, to shew their figures and ramifications. These are coloured, in order to make the parts more conspicuous. Mr. Monro uses red and green chiefly. For the red, vermilion finely levigated must be got. For the green, distilled verdigris is best; because its colour is brighter than that of the common sort, and it never runs into knots, and also dissolves in oily liquors.

To make the fine *injection*, pour a pint of the oil of turpentine on three ounces of vermilion, or verdigris; stir them well with a wooden spatula till they be thoroughly mixed, and then strain all through a fine linen rag.

The coarser *injection* is thus made: take tallow 1 lb; white wax ℥ v. oil of olives ℥ iii; melt them over a gentle fire; then add of Venice turpentine ℥ ij. When this is dissolved, sprinkle in of vermilion or verdigris ℥ iii. then pass all through a warm linen cloth. When you design to make it run far in the vessels, add some oil of turpentine immediately before you use it.

As to the practice of *injection*, we refer to the Medic. Eff. Edinb, vol. i. art. 9.

INIMBOY, in *Botany*, a name by which some authors have called the acacia gloriosa, the tree which produces the bonduch or hezoar nuts.

INITIALIA, a name anciently given to the mysteries of Ceres. See CEREALIA.

INITIANS *paullum*. See PUNCTUM.

INITIATED, a term properly used in speaking of the religion of the ancient heathens; where it signifies being admitted to the participation of the sacred mysteries.

The word comes from the Latin *initiatus*, of *initiare*, *initiari*, which properly signifies to begin sacrificing, or to receive or admit a person to the beginning of the mysteries, or of ceremonies of less importance.

The ancients never discovered the deeper mysteries of their religion, nor even permitted some of their temples to be open to any but those who had been *initiated*. See MYSTERY.

INJUNCTION, in *Law*, a writ generally grounded upon an interlocutory order or decree out of the court of chancery or exchequer, sometimes to give possession to the *plaintiff*, for want of the defendant's appearance; sometimes to the king's ordinary court, and sometimes to the conusee in fine, to stop proceedings in a cause, upon suggestion made, that the rigour of the law, if it take place, is against equity and conscience in that case, that the complainant is not able to make his defence in these courts, for want of witnesses, &c. or that they act erroneously, denying him some just advantage. The writ of *injunction*, is directed not only to the party himself, but to all and singular his counsellors, attornies, and solicitors, and if any attorney, after having been served with an *injunction*, proceeds afterward contrary to it, the court of chancery will commit the attorney to the Fleet for contempt. But if an *injunction* be granted by the court of chancery in a criminal matter, the court of king's bench may break it, and protect any that proceed in contempt of it.

INJURY, *injuria*, in a general sense, signifies any thing contrary to justice and equity; that is, any wrong or damage done to a man's person, reputation, or goods.

The word is derived from the Latin preposition *in*, which here has a negative power; and *jus*, *juris*, right: *injuria dicitur omne quod non jure fit*. The ancients made a goddess of *injury*, and called her Ate. Homer makes her the daughter of Jupiter, and says, she did mischief to every body, even to her father; that she was very nimble and tender-footed, and walked altogether on men's heads without ever touching the ground.

Civilians define *injury* a private offence, committed designedly, and with an evil intention to any man's prejudice, with regard to his person or his property. All civil *injuries* are of two kinds; the one without force or violence, as slander, or breach of contract; the other joined with force and violence, as batteries, and false imprisonment. The author of the Rhetorics to Herennius says, *Injuria est quæ aut facientes, aut invitos, aut tacentes, corpori, animo, aut rebus alterius violavit.*

By the Roman law, the action for an *injury* was annual; that is, no reparation could be required after the expiration of a year. By the law of the Twelve Tables, where the *injury* was the breaking of a limb, the injured person might demand talionem, that is, that he might break the same limb of the criminal.

For the breaking of a bone there were also considerable pecuniary punishments assigned: for other *injuries* only twenty asses were decreed, which the poverty of those times thought a sufficient penalty; but the prætors afterwards finding this too slender a satisfaction, in lieu thereof appointed the injured person to set a rate on the *injury*, which they afterwards increased or lessened as they thought good.

Some of our lawyers make a distinction between a *damage* and an *injury*; and indeed there are many acts which may be done to the prejudice of a third person, which may be properly said to be *damnum sine injuria*.

INK, a liquor wherewith to write on paper or parchment.

INK, *printing*. See PRINTING.

INK, *writing*, is commonly made of copperas and gum arabic; but other astringent plants may serve the same purpose; such as oak-bark, red roses, log-wood, or sumach. Mr. Boyle seems to doubt whether all astringent vegetables will do the same.

Many are the propositions, and methods of compounding the materials for making of writing *ink*. The author of the Chemical Dictionary gives the following receipt for making good *ink*. In four French pints of common water or beer, let a pound of bruised galls be infused twenty-four hours without boiling; to this add six ounces of gum arabic; and when the gum is dissolved, six ounces of green vitriol, which will soon give it the black colour; the liquor is then to be strained through a hair sieve.

The following method has been recommended by experience, and is easily and speedily practised. To a gallon of boiling water, put six ounces of blue galls, grossly pounded, and three ounces of copperas; stir the mixture well together, and then add six ounces of gum arabic pounded. After stirring the whole thoroughly, leave it to settle, and the next day strain it off from the dregs for use. See INK *Indian sympathetic*.

The following composition will make a very good black writing *ink*. Take a gallon of soft water, and boil in it a pound of chips of log-wood for about half an hour; pour the decoction boiling hot on a pound of the best Aleppo galls powdered, and two ounces of pomegranate peels, put into a proper vessel. After having stirred them well together with a wooden spatula, place them in the sun-shine in summer, or within the warmth of any fire in winter, for three or four days, stirring the mixture occasionally: then add half a pound of green vitriol powdered, and let the mixture remain four or five days more, occasionally stirring it; and then add four ounces of gum arabic dissolved in a quart of boiling water; and after the *ink* has settled, strain it off through a coarse linen cloth, and keep it well stopt for use.

As the duration of records and other valuable writings depends much on the goodness of the *ink* employed, Mr. Lewis has thought this subject worthy of his attention. The chief imperfection of common *ink* is, that it decay in time, and at last the writing becomes invisible.

From experiments made by that author, he infers, that the decay of *inks* is chiefly owing to a deficiency of galls: that the galls are the moſt perishable ingredient, the quantity of theſe, which gives the greateſt blackneſs at firſt (which is about equal parts with the vitriol) being inſufficient to maintain the colour; that for a durable *ink*, the quantity of galls cannot be much leſs than three times that of the vitriol; that it cannot be much greater without leſſening the blackneſs of the *ink*; that by diminiſhing the quantity of water, the *ink* was rendered blacker and more durable; that diſtilled water, rain water, and hard ſpring water, had the ſame effects; that white wine produced a deeper black colour than water; that the colour produced by vinegar was deeper than that by wine; that proof ſpirit extracted only a reddiſh-brown tinge, and rectified ſpirit a paler brown; that the laſt mentioned tinctures ſunk into, and ſpread upon the paper; and hence the impropriety of adding ſpirit of wine to *ink*, as is frequently directed, to prevent mouldineſs or freezing; that other aſtringents, as oak-bark, biſtort, ſloe-bark, &c. were not ſo effectual as galls, nor gave ſo good a black, the colour produced by moſt of theſe, excepting oak-bark, being greeniſh; that the juice of ſloes did not produce a black colour with martial vitriol; but that, nevertheleſs, the writing made with it became black, and was found to be more durable than common *ink*; the *inks* made with ſaturated ſolutions of iron in nitrous, marine, acetous acids, in tartar, or in lemon juice, were much inferior to the *ink* made with martial vitriol; that the colour of *ink* was deſtroyed by adding quicklime, which was done with an intention of deſtroying any ſuperabundant acid which might be ſuppoſed to be the cauſe of the loſs of the colour of the *ink*; that the beſt method of preventing the effects of this ſuperabundant acid is probably by adding pieces of iron to engage it; and that this conjecture was confirmed by an inſtance the author had heard, of the great durability of the colour of an *ink* in which pieces of iron had been long immerſed; and laſtly, that a decoction of logwood uſed inſtead of water, ſenſibly improved both the beauty and deepneſs of the black, without diſpoſing it to fade. The ſame author obſerves, that the addition of gum arabic is not only uſeful, by keeping the colouring matter ſuſpended in the fluid, but alſo by preventing the *ink* from ſpreading, by which means a greater quantity of it is collected on each ſtroke of the pen. Sugar, which is ſometimes added to *inks*, was found to be much leſs effectual than gum, and to have the inconvenience of preventing the drying of the *ink*. The colour of *ink* is found to be greatly injured, by keeping the *ink* in veſſels made of copper, or of lead, and probably of any other metal, excepting iron, which the vitriolic acid can diſſolve. The foregoing experiments point out for the beſt proportions of the ingredients for *ink*; one part of green vitriol, one part of powdered logwood, and three parts of powdered Aleppo, or blue galls. The beſt menſtruum appears to be vinegar or white wine, though for common uſe water is ſufficient. If the *ink* be required to be of a full colour, a quart, or, at moſt, three pints, of liquor may be allowed to three ounces of galls, and to one ounce of each of the other two ingredients. Half an ounce of gum may be added to each pint of the liquor; though the more gum we can employ, conſiſtently with due freedom of writing, it is probable that the *ink* will be the more durable. The ingredients may be all put together at once in a convenient veſſel, and well ſhaken four or five times each day. In ten or twelve days the *ink* will be fit for uſe, though it will improve by remaining longer on the ingredients; or it may be made more expeditiouſly, by adding the gum and vitriol to a decoction of galls and logwood in the menſtruum. To the *ink*, after it has been ſeparated from the feculencies, ſome coarſe powder of galls, from which the fine duſt has been ſifted, together with one or two pieces of iron, may be added, by which its durability will be ſecured.

It has been often remarked, ſays the ſame ingenious writer, that the *inks* uſed in former times were far more durable than thoſe of later years; many modern records being more decayed than manuſcripts of much greater antiquity, of which we have inſtances in the Letters of Camillo Paderni, publiſhed in the Philoſophical Tranſactions for 1753 and 1754. Dr. Lewis made ſeveral experiments, in order to recover the compoſition of this durable *ink*. Inſtead of oil, which is uſed in the *printers ink*, he mixed both lamp-black and ivory-black with a ſolution of gum arabic; this liquor wrote of a fine black colour, but when dry, it rubbed off entirely by moiſture. Concluding, therefore, that the colour could not be ſufficiently fixed on paper without an oily cement, and as oils are made miſcible with watery fluids by the intervention of gum, he mixed ſome of the beſt printers varniſh with about half its weight of a thick mucilage of gum arabic, working them well together in a mortar, and beat this maſs with lamp-black, adding water by little and little, and continuing the rubbing, till the mixture became of a due conſiſtence for writing. This produced characters of a full browniſh black colour, which could not be diſcharged by rubbing, nor waſhed out ſo readily as the foregoing. Inſtead of the printers varniſh, or boiled oil, linſeed-oil was mixed in the ſame manner with mucilage and lamp-black, and the mixture diluted with water; and the *ink* thus obtained was much the ſame as the other. To prevent the diſcharge by water, ſome of the more ſinking kinds of paper, or common paper made damp as for printing, muſt be uſed, which will admit the *ink* to ſink a little into its ſubſtance; and thus the characters will be as fixed as can be deſired. Such Dr. Lewis found to be the ancient *inks*, that were ſo durable. Pliny and Vitruvius expreſly mention the preparation of ſoot, or lamp-black, and the compoſition of writing-*ink* from lamp-black and gum. Dioſcorides ſets down the proportion of three ounces of the ſoot to one of gum. This mixture was formed into cakes or rolls, and dried in the ſun, which were occaſionally tempered with water, as the Indian *ink* is with us for painting. The ancients were ſenſible that theſe *inks* were liable to be diſcharged by water, and endeavoured to obviate this imperfection, according to Pliny, by uſing vinegar, inſtead of water, for tempering the mixture of lamp-black and gum, which promotes the ſinking into the paper. After all, none of theſe *inks* can be diſcharged otherwiſe than by deſign; which is the caſe with reſpect to the vitriolic *inks*, and thoſe of printed books and copper-plates.

In the courſe of Dr. Lewis's experiments, a farther improvement occurred to him, which was that of uſing the common vitriolic *ink*, inſtead of water, for tempering the ancient mixture of gum and lamp-black. By this method the writings will have the durability of thoſe of former times, with all the advantage that reſults from the vitriolic *ink* fixing itſelf in the paper. Common writing *ink* may, in many caſes, be improved by a ſmall addition of the ancient compoſition, or of the common *Indian* INK. Lewis's Commerce of Arts, &c. § 16.

INK *powder* may be prepared, by infuſing a pound of galls powdered, and three ounces of pomegranate-peels, in a gallon of ſoft water for a week, in a gentle heat; and then ſtraining off the fluid through a coarſe linen cloth. Add to it eight ounces of vitriol diſſolved in a quart of water, and let them remain for a day or two; preparing in the mean time a decoction of logwood, by boiling a pound of the chips in a gallon of water, till one third be waſted, and then ſtraining the remaining fluid while it is hot. Mix this decoction and the ſolution of galls and vitriol together, and add five ounces of gum arabic, and then evaporate the mixture over a common fire to about two quarts; when the remainder muſt be put into a veſſel proper for that purpoſe, and reduced to drineſs in *balneo Mariæ*, i. e. by hanging the veſſel in boiling water. The remaining maſs, after the fluid is wholly exhaled, muſt be well powdered; and when it is wanted for uſe, may be converted into *ink* by the addition of water.

A portable or extemporaneous *ink* may be made without galls or vitriol, by mixing half a pound of honey and the yolk of an egg, adding two drams of gum arabic finely levigated, and thickening the whole with lamp-black to the conſiſtence of a ſtiff paſte; which being put to a proper quantity of water, may be uſed as an *ink*.

INK, *Indian*, or *Chineſe*, is an admirable compoſition, in vain attempted to be imitated in Europe. It is not fluid, like our writing *inks*, but ſolid, like our mineral colours, though much lighter. They make it of all figures, but the moſt uſual is rectangular, about a quarter of an inch thick. Some of the ſticks are gilt with figures of dragons, birds, flowers, &c. In order to do this, they have little wooden moulds, ſo curiouſly wrought, that we could hardly equal them in metals.

To uſe this *ink*, there muſt be a little hollow marble, or other ſtone, with water in it, on which the ſtick of *ink* muſt be ground, till the water becomes of a ſufficient blackneſs. It makes a very black thining *ink*; and though it be apt to ſink when the paper is thin, yet it never runs or ſpreads; ſo that the letters are always ſmooth, and evenly terminated, how big ſoever they be. It is of great uſe in deſigning, becauſe it may be weakened or diminiſhed to any degree; and there are abundance of things which cannot be repreſented to the life without it.

From an analyſis of this *ink*, Dr. Lewis concludes that it contains an animal ſubſtance ſoluble in water, and conſiſts of a black powder, mixed with ſome animal glue. He tried to imitate it, by mixing ſome lamp-black, prepared from linſeed oil, by hanging a large copper pan over the flame of a lamp to receive its ſmoke, with as much melted glue as gave it ſufficient tenacity for being formed into cakes. Theſe cakes, when dry, anſwered

as well as the genuine Indian *ink*, in regard both to the colour, and the freedom and smoothness of working. Ivory black, and other charcoal blacks, levigated very fine, had the same effect with the lamp-black. It appears from three receipts for the preparation of Indian *ink*, in Du Halde's History of China, that the colouring material is lamp-black, to which is added, in one of them, a quantity of horse-chesnuts burnt till the smoke ceases. The coagulating matter, in one of the prescriptions, is a thin size of neat's leather; in another, a solution of gum tragacanth, and in the other, a mixture of both, with a decoction of certain vegetables, unknown to us. Du Halde observes, that the Chinese have *inks* of different goodness and price; that the most essential difference proceeds from the quality of the lamp-black, and that the best is the soot of oil, burnt in lamps, in apartments fitted up for this purpose.

The Chinese have often attempted to use this in their porcelain, to give the colour of black to the figures traced on white vessels, but it has been a vain attempt; for however beautiful and strong the figures might appear when first laid on, and even when the vessels were dried, it all disappeared on the baking, and they came out quite white as they were put in. The colours for this use must be such as can penetrate the varnish, and endure the fire. Mineral colours are found to have these qualities, and these alone therefore are to be employed; such light ones as this black burning off from the surface, and wholly disappearing. Obs. sur les Coûtumes de l'Asie, p. 329.

INK is also an appellation given to any coloured liquor used in the same manner as black *ink*; as red, green, blue, yellow, &c. *inks*. Red writing *ink* is prepared by infusing a quarter of a pound of the rasp'ings of Brasil wood for two or three days in vinegar; boiling the infusion for an hour over a gentle fire, and afterwards filtering it, while hot, through paper laid in an earthen cullender; then put it again over the fire, and dissolve in it, first, half an ounce of gum arabic, and afterwards alum, and white sugar, of each half an ounce. Red *ink* may be also made of vermillion, by beating together the glair of four eggs, a tea-spoonful of white sugar, or sugar-candy, powdered, and as much spirit of wine, till they be of the consistence of oil; then adding such a proportion of vermillion as will produce a red colour of sufficient strength; the mixture should be kept in a small phial, or well-shaped *ink* bottle, and well shook before it be used. Gum-water is often used instead of the glair of eggs; but thin size made of isinglass, with a little honey, is much better for the purpose.

For red printing *ink*, see PAINTING.

Green *ink* may be made, by putting an ounce of powdered verdigris to a quart of vinegar, and straining the fluid, after it has stood two or three days: or, instead of this, the crystals of verdigris dissolved in water will answer the purpose; then dissolve in a pint of either of these solutions, five drams of gum arabic, and two drams of white sugar.

Blue *ink* is made by grinding indigo with honey and the white of eggs, and making it fluid with water.

Yellow *ink* is made by an infusion of saffron in water, with a little alum and gum arabic: or, by boiling two ounces of AVIGNON, or French berries, in a quart of water, with half an ounce of alum, till one third of the fluid be evaporated, and then dissolving in it two drams of gum arabic, and one dram of sugar, and afterwards a dram of powdered alum.

In general, *inks* of all colours may be made by using a strong decoction of the ingredients used for DYING, mixed with a little alum and gum arabic. See the several colours, BLUE, GREEN, &c.

INKS, *sympathetic*, or *secret*. Every sort of liquor with which a person may write, so that the letters do not appear till there is some particular means used to give them a colour different from that of the paper, are called by the name of *sympathetic inks*; and of these there a great many kinds described in the writings of Baptista Porta, Lemery, and other authors.

All these *inks* may be regularly distributed into different classes, according to the different means which are to be used to make them appear; and these are in general the four following. 1. By giving a new liquor, or the vapour of a new liquor, a place on the paper, on which the letters are written with the naturally invisible *ink*. 2. By exposing the paper to the air, by which means the letters at first invisible will appear. 3. By passing gently over the letters a matter of some remarkable colour reduced to fine powder. And, 4. By exposing the paper to the fire.

This last is by much the best method, and is so general, that it may be prudently used to all papers suspected of containing any secret writing, as it seldom fails to discover it. All the common *inks* of this kind however, when they have been once made to appear, either by fire or by any other method, can never be made to disappear again; but there is one kind described by Mr. Hellot, in the Memoirs of the Academy of Sciences at Paris, and since tried many times with us, and elsewhere, which, though the letters it gives are in themselves invisible, and appear like those of some other of these *inks*, on their being held to the fire, yet they after that will fade and disappear on the paper again, and may be reproduced in this manner several times. This therefore is the first known *ink* of a fifth general class, of which future researches may discover perhaps more.

Of the first class of *sympathetic inks*, or those which do not appear till the paper on which they are written be made to imbibe another liquor, or the vapour of another liquor, are the following kinds.

To two or three parts of unslaked lime put one of yellow orpiment; powder and mix the two, adding fifteen or sixteen times as much water as there was orpiment; stop up the phial with a cork and bladder, and set it in warm embers, shake the phial now and then for five hours, and warily decant the clear part, or rather filtrate it. In the room of this preparation may be used a saturated solution of common brimstone, made by boiling the brimstone either with quicklime, or in strong alcaline ley. In the mean time, burn a piece of cork thoroughly, and when well inflamed, quench it in common water, or rather in brandy. Being thus reduced into a friable coal, grind it with fair water, wherein gum arabic has been dissolved; and it will make a liquor as black as the common ink.

While these are doing, dissolve, in three times as much distilled or strong vinegar, over warm embers, a quantity of red lead, or of saccharum saturni, in thrice the quantity of water, for three or four hours, or till the liquor have a sweet taste. This liquor will be as clear as common water. Solutions of lead in aqua fortis answer the same end, except that, when written with, they are apt to corrode the paper.

The liquors thus prepared, write any thing on paper with this last sort, dry it, and nothing will appear. Over the place, write what you please with the second liquor; it will appear as if written with common ink: when dry, dip a small piece of rag or spunge in the first liquor, rub it over the written place, and the black writing will vanish; and that wrote with the invisible ink will appear black and legible. Again, take a book four or five inches thick, and on the first leaf write any thing with the last liquor; turn to the other end of the book, and rub there with a rag, dipt in the first liquor, on that part, as near as you can guess, opposite to the writing, and leave also the rag there, clapping a paper over it; then nimbly shutting the book, strike four or five smart strokes thereon with your hand, and turning the other side uppermost, clap it into a press, or lay it under a good weight for a quarter of an hour, or even half that time; then will the writing done with the invisible *ink* be found legible there.

The above operation may be varied, by writing the invisible characters with the solution of bismuth in nitrous acid, and exposing them to the vapours of liver of sulphur, or moistening them with a solution of liver of sulphur.

Dissolve white or green vitriol in water, and writing with the solution, nothing will appear. Boil galls in water, and dip a linen rag in the decoction, and with it rub the place before writ, and it will appear black and legible. Rub it over again with spirit of vitriol, or its oil, and the writing will disappear again; rub it over again with oil of tartar per deliquium, the letters will appear again, but of a yellow colour. If the blackness of ordinary *ink* be destroyed by a sufficient quantity of nitrous acid, the writing made by it will remain invisible till it be moistened with liquid fixed alkali.

The golden *sympathetic ink*. This is made by dissolving in aqua regia as much gold as that menstruum can take up, and then adding to the liquor five or six times as much water; in another vessel there must be some tin dissolved in aqua regia; and when that menstruum has also taken up as much of the metal as it can, there is to be added to it an equal quantity of common water. The letters must be written on white paper with the solution of gold, and the writing being dried in the shade, the letters will not appear, at least not for seven or eight hours afterwards; dip a pencil in the solution of tin, and rub that over the solution of gold with which the letters were written, and they will appear of a beautiful purple. It might be supposed, that any other metals which were soluble in the same acid menstruum would equally produce this effect: but experiment shews, that this is not the case; and silver and copper, though both soluble in aqua fortis, yet produce no change of colour by these precipitations made by mixing the solutions of them on

paper; and this example of such an effect in the solutions of gold and tin, is an exception to the general rules in the solutions of metals, and their effects on one another.

The purple colour of these letters may be again effaced by rubbing some simple aqua regia over the paper, and may be made to appear again by rubbing over that the solution of tin. Kunkel, Cassius, and Orschal, with some other writers, made the first steps towards this discovery, by their attempt to give crystal, by means of gold, the colour of the oriental rubies. There are beside these mineral preparations some vegetable ones, which give the same phenomena, but these are the more certain.

Of the second kind of *sympathetic inks*, or those which appear on being exposed only to the air, is the golden *ink* made by adding to a solution of gold in aqua regia, so much water that the liquor shall not stain a white paper; letters written with this will not appear till the paper has been exposed some hours to the open air, and they will then begin to acquire a colour by degrees, till they at length become of a deep violet colour, tending to black. If, instead of exposing the paper to the air, it be kept in a box close shut up, or closely folded in other paper, it will remain invisible two or three months; but at the end of that time it will begin to appear, and will by degrees become of a deep violet colour. So long as the gold remains united to its dissolvent, it is yellow; but the acid that dissolves it being of a volatile nature, the greater part of it evaporates, and leaves no more than is just necessary to colour the calx of gold which remains upon the paper.

The second of these is the silver *ink*, made by a solution of silver in aqua fortis, weakened by distilled water, till it will not stain the paper. Letters written with this will be invisible for three or four months, if shut up in a box; but if they be exposed to the sun they become legible in about an hour, because by this means the evaporation of the acid is accelerated. The letters written with this *ink* are of a slate colour; and that from the sulphureous nature of the aqua fortis, every thing that is sulphureous blackening silver. This blackish colour, however, is not permanent; for the sulphureous part finally evaporating, the letters are left to their natural appearance, and are of a true silver colour, if the silver that was used was fine, and the plate open.

In this class there may also be placed several metallic dissolutions; as that of lead in vinegar, and of copper in aqua fortis, which give at length a brownish colour upon the paper; as also the solution of tin in aqua regia, of mercury in aqua fortis, of iron in vinegar, of emery and several of the pyrites in spirit of salt. But all these, though they give letters which are after some time legible, on being exposed to the air, are also made to appear instantly on the paper, on holding them to the fire. Each of these solutions gives its own particular colour; but they have all this disadvantage, that in time they eat away the paper, and the letters are seen in the shape of so many holes.

Of the third class of *ink*, or that which appears on rubbing over the paper with a brown or black powder, are almost all the glutinous expressed juices of plants, which are themselves of no remarkable colours, the milk of animals, or any other thick and viscous fluids. To use these, the letters must be written on a white paper, and when dry, there is to be thrown over them the fine powder of any coloured earth, or other such substance; and the writing will afterwards appear coloured, because its viscous quality remains sufficiently in it for the entangling and retaining this fine powder, though it falls easily off from every other part of the paper. Mem. Acad. Scienc. Par. 1737.

Of the fourth class, or those *inks* which become visible on holding them to the fire, there are a vast number; and indeed all infusions, the matter of which is readily burnt to a sort of charcoal by a little fire, will answer this purpose. The nicest of this kind is the sal ammoniac *ink*, made by dissolving a scruple of sal ammoniac in two ounces of fair water. Letters written with this solution are invisible on the paper, till it is held before the fire, or has an iron a little heated passed over it. The rationale of this is, that the inflammable part of the sal ammoniac is burnt to a charcoal by a heat which is not sufficient to scorch the paper; and this is the case with all the rest of this class. The letters written with this solution are, however, of no great duration; for the salt being apt to moisten in the air, the letters soon spread, and run together in a confused manner.

Dr. Lewis says, that all the salts which he has tried produce this effect in a greater or less degree; nitre, alum, tartar, very weakly; sea-salt more strongly; fixed alcaline salts still more so; but sal ammoniac the strongest of all. Metallic solutions, made in acids, and diluted so as not to corrode the paper, act in the same manner. The juice of lemons and milk have also been used as *sympathetic inks*, the writing with which appears upon the application of heat sufficient to decompose the oily and mucilaginous parts of these liquors.

The fifth class of *sympathetic ink* contains only one yet known kind.

This, though in itself invisible, becomes of a bluish green when held to the fire; and this colour disappears again as the paper cools, and is to be produced again on holding it again to the fire; and this for a long time, and a repeated series of trying. It may also, according to the different manner of treating it, be made to appear blue, green, yellow, red, and of some other colours. This property of the tinging matter of bismuth ore was published at full length by a German lady, in 1705.

A certain German chemist shewed the academy at Paris a salt of rose-water, which became blue on holding it to the fire, and at the same time shewed the ore from which he procured the salt, which he called an ore of marcasite, a name given by many to the bismuth ore. He added, that this was the mineral from which the fine blue smalt of Snecberg was prepared, and that no other ore but this afforded it, and that he made the tincture from this mineral with aqua fortis, which he fixed with sea-salt.

This was the substance of what the German declared, and from which Mr. Hellot, in 1736, took the hint for his discovery of this remarkable *ink*. The salt was, after many experiments, at length found to be produced from an arsenic ore; and it was found, that all the cobalts and ores of bismuth afford a tincture capable of these changes by fire.

The method of preparing it is this: pour upon two ounces of arsenic ore, grossly powdered, a mixture of five ounces of aqua fortis, and five ounces of common water. After the first ebullition is over, place the vessel in a gentle sand-heat, and let it stand there till no more air-bubbles seem to ascend; after this increase the fire, so as to make the liquor boil for about a quarter of an hour; after this the liquor will become of a reddish colour, and when cold it is to be decanted clear off from the sediment into a phial; and after standing in that some time, it is to be again decanted off from what is precipitated there; and so on for three or four times, till it is quite clear; for it must not be filtered, lest the acid should take something from the paper that might spoil the effects. When the liquor is clear, there must be added to it two ounces of white sea-salt; this mixture is to be evaporated over a gentle sand-heat, till there remains only a dry saline mass. When the liquor is grown hot, it changes from its orange-colour to a fair red; and when the aqueous humidity is evaporated, is become of a beautiful emerald colour, and from this, as it dries up, it changes by degrees to a dirty green, like that of verdigris in the cake. As it becomes nearly dry, it must be stirred about with a glass rod or pestle, to keep it from uniting into a mass; and it must not be kept over the fire till perfectly dry, because by that means the colour is often lost, and the salt from green becomes of a dusky yellow; but if it be taken from the fire while it is green, it gradually becomes reddish as it cools, and finally is of a rose-colour. The manner of using this *sympathetic ink*, is this: write with it on a fine and smooth paper, or draw with a black-lead pencil the figure of a plant or tree on the paper; then trace over the same lines with this liquor; let it dry in the open air, and then rub off the black lines with bread, and the paper will appear altogether fair, though the lines made by the *ink* are in reality sunk deep into it. On holding this paper to the fire the lines will all appear, and the figure of the plant or the letters will be painted in a beautiful bluish green, which will continue so long as the paper is warm; but when it is cold again, they will wholly disappear. The lines, therefore, disappear much sooner in winter than in summer; and in very hot weather it is often necessary to lay the paper on a marble, or other very cold body, in order to produce this effect. At any time, if the paper be scorched in the experiment, the colour of the lines will not disappear again, even if ice be laid upon them. If the writing be exposed for three or four days to a humid air, the lines will appear of a fine pale red. If the impregnation of the ore of bismuth, instead of sea-salt, have alum added to it, and the whole process be continued as before described; and if letters be written with the red liquor as it is taken out of the vessel, the letters will not appear even on holding it to the fire; but if the paper be wetted over with a clear solution of marine salt, and then left to dry, and afterwards held to the fire, the letters will appear blue. The same also will be the effect, if the writing be exposed to the vapour of hot spirit of salt. When this preparation is thus made with alum, instead of common salt, the liquor never becomes green, but continues red, and

never

never changes colour in the drying, or afterwards. The green colour seems to be wholly the effect of the sea-salt; for not only this aluminate impregnation, but others in which other salts had been employed, were always found to be of a different colour.

Glauber's salt used instead of common sea-salt, left the mass red in the same manner as alum did. Nitre added, instead of sea-salt, gave the precipitate, or dried salt, a beautiful purple colour, which became white on the instant that water was poured upon it, and a rose-coloured tincture was drawn from it, which gave lines or letters on paper, which continued invisible as long as they were cold, but assumed a beautiful red on holding the paper to the fire; which colour they retained no longer than while the paper continued warm, disappearing afterwards in the same manner with the green colours made by the sea-salt; and if a simple solution of sea-salt be rubbed over the paper, and suffered to dry, and the paper be afterwards heated, the lines appear blue. Borax has the same effect in this preparation with the nitre. All these experiments were made with the neutral salts; but in order to try what would be the effects of alkalies in the mixture, Mr. Heliot added to three ounces of the impregnation of the ore in aqua fortis, pure salt of tartar, till the ebullition ceased; but the consequence of this was no great precipitation, but merely the subsiding of a small white sediment; this mixture being evaporated nearly to a dryness, the remaining mass, so long as it was warm, appeared of a beautiful purple; but this became paler as it dried, and turned white in an instant on pouring water upon it. This, dissolved in water in the manner of the others, gave lines on paper of a faint rose-colour, which appeared or disappeared in the manner of those made by the other solutions, according as the paper was hot or cold; and the wetting the paper with a solution of sea-salt, had the same effects on this as on the others, making the lines appear blue on holding to the fire. Mem. Acad. Par. 1737. See *Colours from* METALS.

This *ink* may be easily made by digesting zaffre, commonly sold by druggists, in aqua regia; and thus is obtained the soluble part of zaffre, which is the calx of cobalt. This solution is then to be diluted with a little common water. In exposing the paper written with this solution to the fire, care must be taken not to heat it too much; for in this case, the writing will not again disappear by exposure to cold. This *ink*, says the author of the Chemical Dictionary, may be applied to the drawing of landscapes, in which the earth and trees, destitute of verdure, being drawn with common *ink*, give a prospect of winter; and which may be made to assume the appearance of spring, by exposure to a gentle heat, which covers the trees with leaves, and the earth with grass, by rendering visible those parts of the landscapes which are drawn with this sympathetic *ink*; and, as the solution of regulus of cobalt or zaffre in spirit of nitre acquires a reddish colour by the application of heat, the red solution might be contrived to represent the fruits and flowers.

INK *fish*, in *Ichthyology*. See CUTTLE-*fish*, and SEPIA.

INLAGATION, *Inlagatio*, a restoring of one out-lawed to the protection of the law, and benefit of a subject.

The word comes from the Saxon *inlegian*, i. e. *inlagare*. Terms of Law.

INLAGH, *Inlagatus*, he that is of some *frank-pledge*, and not out-lawed. It seems to be the contrary to *utlagh*.

INLAND implies any thing situate in the main land, or heart of a country, *ist* from the sea-coasts.

Hence *inland* bills, in traffick, are such bills as are payable in the same land wherein they are drawn. See BILL.

INLAYING. See VENEERING, MOSAIC, and MARQUETRY.

INLEASED, in our *Old Writers*, signifies entangled or ensnared. It is used in the champion's oath. 2 Inst. 247. Blount.

INLISTING, in a military sense. See LISTING.

INMATES, such persons as are admitted, for their money, to live in the same house or cottage with another man, in different rooms, but going in at the same door; being usually supposed to be poor, and not able to maintain a whole house themselves. These are inquirable in a court-leet.

No owner or occupier of a COTTAGE shall suffer any *inmates* therein, or more families than one to inhabit there, on pain of forfeiting 10*s.* per month to the lord of the leet.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. See ALEHOUSES.

If a person who keeps a common *inn*, refuses to receive a traveller into his house as a guest, or to find him victuals and lodging, on his tendering him a reasonable price for them, he is liable to an action of damages, and may be indicted and fined at the king's suit. By the yearly acts against mutiny and desertion, the constable, and in his default a justice of the peace, may quarter soldiers in *inns*, livery-stables, ale-houses, and victualling houses. The rates of all commodities sold by *inn-keepers*, according to our ancient laws, may be assessed; and *inn-keepers* not selling their hay, oats, beans, &c. and all manner of victuals, at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c. by 21 Jac. I. cap. 21. Where an *inn-keeper* harbours thieves, persons of infamous character, or suffers any disorders in his house, or sets up a new *inn* where there is no need of one, to the hindrance of ancient well governed *inns*, he is indictable and finable; and by statutes such *inn* may be suppressed. Action upon the case lies against any *inn-keeper*, if a theft be committed upon his guest by a servant of the *inn*, or any other person not belonging to the guest; though it is otherwise where the guest is not a traveller, but one of the same town or village; for in that case the *inn-keeper* is not chargeable; nor is the master of a private tavern answerable for a robbery committed on his guest. It is said that even though the travelling guest does not deliver his goods, &c. into the *inn-keeper's* possession, yet if they are stolen he is chargeable. An *inn-keeper* is not chargeable for any thing out of his *inn*, but only for what is within it; yet where he of his own accord puts the guest's horse to grass, and the horse is stolen, he is answerable; he not having the guest's orders for putting such horse to grass. The *inn-keeper* may justify stopping the horse, or other things of his guest, for his reckoning; and may detain the same until it be paid. Where a person brings his horse to an *inn*, and leaves him in the stable, the *inn-keeper* may detain him until such time as the owner pays for his keeping; and if the horse eats out as much as *he* is worth, after a reasonable appraisement made, he may sell the horse, and pay himself. But when a guest brings several horses to an *inn*, and afterwards takes them all away, excepting one, this horse so left may not be sold for payment of the debt of others; for every horse is to be sold, only to make satisfaction for what is due for his own meat.

Any person found tipling in an *inn*, is adjudged within the statutes against DRUNKENNESS; and *inn-keepers*, or alehouse-keepers, permitting tipling in their houses, are liable to the penalty of 10*l.* &c. by 1 Jac. cap. 9. 1 Car. cap. 4. 21 Jac. cap. 7.

INNS. Our colleges of municipal or common law professors and students, are called *inns*: the old English word for houses of noblemen, bishops, and others of extraordinary note, being of the same signification with the French word *hotel*.

INNS *of court* are so called, as some think, because the students there are to serve and attend the courts of judicature; or else, because anciently these colleges received none but the sons of noblemen, and better sort of gentlemen, who were here to be qualified to serve the king in his court; as Fortescue affirms. And in his time he says, there were about two thousand students in the *inns* of court and chancery, all of whom were *filii nobilium*, or gentlemen born. But this custom has gradually fallen into disuse; so that in the reign of queen Elizabeth, sir Edward Coke does not reckon above a thousand students, and the number at present is very considerably less; for which judge Blackstone assigns the following reasons. 1. Because the *inns* of chancery being now almost totally filled by the inferior branches of the profession, are neither commodious nor proper for the resort of gentlemen of any rank or figure; so that there are very rarely any young students entered at the *inns* of chancery. 2. Because in the *inns* of court all sorts of regimen and academical superintendence, either with regard to morals or studies, are found impracticable, and therefore entirely neglected. Lastly, because persons of birth and fortune, after having finished their usual courses at the universities, have seldom leisure or resolution sufficient to enter upon a new scheme of study at a new place of instruction; wherefore few gentlemen now resort to the *inns* of court, but such for whom the knowledge of practice is absolutely necessary in such as are intended for the profession. Comm. book i. p. 25.

Our *inns of court*, justly famed for the production of men of learning in the law, are governed by masters, principals, benchers, stewards, and other officers; and have public halls for exercises, readings, &c. which the students are obliged to attend, and perform for a certain number of years, before they can be admitted to plead at the bar. These societies have not, however, any judicial authority over their members; but instead of this they have

have certain orders among themselves, which have by consent the force of laws. For lighter offences persons are only excommoned, or put out of commons; for greater, they lose their chambers, and are expelled the college; and when once expelled out of one society, they are never received by any of the others. The gentlemen in these societies may be divided into benchers, utter-barristers, inner-barristers, and students.

The four principal *inns* of court, are the Inner Temple and Middle Temple, heretofore the dwelling of the Knights Templars, purchased by some predecessors of the common law about three hundred years ago; Lincoln's *Inn*, and Gray's *Inn*, anciently belonging to the earls of Lincoln and Gray. The other *inns* are the two Serjeants' *Inns*.

INNS *of chancery* were probably so called, because anciently inhabited by such clerks as chiefly studied the forming of writs, which regularly belonged to the curtitors, who are officers of CHANCERY.

The first of these is Thavies *Inn*, begun in the reign of Edward III and since purchased by the society of Lincoln's *Inn*. Beside this we have New *Inn*, Symond's *Inn*, Clement's *Inn*; Clifford's *Inn*, anciently the house of the Lord Clifford; Staple *Inn*, belonging to the merchants of the staple; Lion's *Inn*, anciently a common *inn* with the sign of the lion; Furnival's *Inn*, and Bernard's *Inn*.

These were heretofore preparatory colleges for younger students; and many were entered here, before they were admitted into the *inns* of court. Now they are mostly taken up by attornies, solicitors, &c.

They all belong to some of the *inns* of court, who formerly used to send yearly some of their barristers to read to them.

INN, or INNER, in the *Manege*, is applied differently, according as the horse works to the right or left upon the volts, or as he works along by a wall, a hedge, or the like. For along or by a wall, the leg that is of a side with, or next the wall, is the outer, and the other the *in* or *inner* leg. And if upon volts, the horse works to the right, the right heel is the *inner*, and the left the outer heel, and so of the other parts of the body, furniture, &c. The direct contrary of this will happen, if the horse works to the left.

INNATE. *adv.* See AIR.

INNATE *force*. See VIS *insita*.

INNATE *heat*. See HEAT.

INNATE *ideas*, or *principles*, are certain primary notes or characters, by many supposed to be stamped on the mind of man when it first receives its being, and which it brings into the world with it.

But the doctrine of *innate ideas* is abundantly confuted by Mr. Locke. See IDEA.

INNER *barristers*. See BARRISTER.

INNINGS, lands recovered from the sea, by draining and banking.

INNOCENTS *day*, the name of a feast celebrated on the twenty eighth day of December, in commemoration of the infants murdered by Herod.

Heretofore it was the custom to have dances in the churches on this day, wherein were persons who represented bishops, by way of derision, as some suggest, of the episcopal dignity, though others, with more probability, suppose it done in honour of the innocence of childhood. See EPISCOPUS *puerorum*.

By a canon of the council of Cognac, held in 1260, these were expressly forbid; but they were not wholly suppressed, at least in France, before the year 1444, when the doctors of the Sorbonne addressed a spirited letter on this subject to all the bishops of the kingdom.

INNOMINATA *arteria*, is the external branch of the external iliac artery, at its division about the hole in the ligamentum Fallopii. It ascends outwardly to the umbilicus of the ilium; it is lost in the muscles of the belly, and it sends branches to the illacus internus. See ILIAC *vessels*.

INNOMINATA *ossa*. See OSSA *innominata*, under Os.

INNOMINATI, *Gli* INNOMINATI, *Innomi*, persons who have no names, a title by which the academists of Parma distinguish themselves.

Most cities in Italy have an academy, and each has its proper name. Thus, those at Parma entitle themselves *Gli innominati*, as if it was their character to have no name at all.

INNOMINATUM, in general, signifies any thing without a name.

Many parts of the body are left under this indistinct term; as the *innominata glandula oculi*, now called *caruncula lacrymalis*; *innominata tunica oculi*, &c. See EYE.

Os INNOMINATUM is that otherwise called *os coxæ*, or *coxendix*; being composed of three bones, viz. the ILIUM, the PUBIS, and ISCHIUM, only connected by cartilages. See *Tab. Anato (Oft.) fig.* 3. n. 16, 17, 18, 19. See Os.

INNOVATION, in *Law*. See NOVATION.

INNUENDO, of *innuo*, *I nod*, or *beckon*, is a word frequently used in writs, declarations, and pleadings, to ascertain a person or thing which was named, but left doubtful, before: as, he (*innuendo* the plaintiff) did so and so; mention being before made of another person. In common conversation or writing, an *innuendo* denotes an oblique hint, or distant reference, in contradistinction to a direct and positive charge.

INOCULATION, or BUDDING, in *Agriculture* and *Gardening*, a kind of grafting, or an artificial operation, by which the bud of one fruit-tree is set into the stock or branch of another, so as sometimes to make different sorts of fruit grow in the same trees. See ENGRAFTING.

There are various ways of performing this: the ancient method was, by making a thallow incision in the bark, where the knot of a shoot or eye, *ocular* (whence the operation takes its name), begins to bud forth; into this a promising shoot of another kind was inserted, and the incision closed up with fat earth or clay.

Peaches, nectarines, cherries, plums, &c. as also oranges and jessamines, succeed very well this way, and it is indeed preferable to any other for fruit-trees in general.

The method of performing it is this: the operator must be provided with a sharp pen-knife, having a flat haft, the use of which is to raise the bark of the stock, to admit the bud, and some sound bass mat, which should be soaked in water to increase its strength, and make it more pliable; then having taken off cuttings from the trees to be propagated, a smooth part of the stock must be chosen, which, if intended for dwarfs, must be about five or six inches above the ground; but if for standard, it should be as many feet high. A horizontal cut is then to be made across the rind of the stock, and from the middle of that another slit must be made strait downward of two inches in length, that the whole may have the figure of the letter T, but these must not be cut too deep. Then cutting off the leaf from the bud, but leaving its foot-stalk remaining, a cross cut is to be made on it about half an inch below the eye, and the bud is to be slit off with part of the bark to it, in form of an escutcheon. The wood then must be taken out of the slip of the bud, without pulling the eye of the bud out with it; for if this happens, the bud must be thrown away as incapable of succeeding. When the bud is thus prepared, the bark of the stock is to be gently raised with the flat haft of the penknife, and the escutcheon of the bud must be slipped in, and placed very evenly between the bark and the wood, cutting off any part of the rind of the bud which may be too long for the slit made in the stock. The whole is then to be gently tied up with the bass mat, beginning at the lower part of the slit, and taking great care not to injure the eye of the bud, which is to be left out at the slit. In three weeks or a month the bud will shew that it is joined; and then the tying round the stock must be loosened; and in the March following, the stock must be cut off about three inches above the bud, sloping it that the wet may run off. To this part of the stock the shoot proceeding from the bud is to be tied, lest the winds should loosen or displace it; and when the tree has shot one year in this state, the stock must be cut down close to the bud.

The season for *inoculating* is from the middle of June to the middle of August, according to the forwardness of the trees. When the buds are formed at the ends of the shoots of the same year, it is a proof that the tree is fit for the purpose; the first tree that comes in season to be *inoculated* is the apricot, and the last the orange-tree; and in doing this, choice should always be made of a cloudy day, that the sun may not dry up the buds too quick; and in some very tender plants, a part of the wood in the escutcheon of the bud should be left in. Miller.

This practice has the advantage of engrafting in many respects, both as it is more secure, it seldom failing of having effect, especially if two or three buds are put into the same stock, and as its success is more readily discovered. Indeed, when large stocks are to be practised on, *inoculation* is not proper, and they are then obliged to have recourse to *grafting*.

This one rule is observed to hold universally, viz. that no success is to be expected in *inoculation*, if the sap does not run well; that is, if the bark will not part readily from the wood of the stock.

It is said by many, that such trees as are *inoculated* in the month of February, will continue always free from worms, both themselves and their fruit; but this is a thing not confirmed by experience. Another error in these things is, the opinion that a cyon taken from a young tree which has never yet blossomed, will never bear fruit; experience proves that it will: but our gardeners choose rather to take their cyons from such trees as have already borne. Phil. Trans. N° 2.

In the *inoculations* made upon fruit-trees, it is obſervable, that a little vegetable bud, often not ſo big as a pea, is able ſo to tranſmute all the ſap which arrives at it, that though this ſap be already in the root, and in its paſſage upwards, determined by nature's intention, as is ſaid, to the production of fruit natural to the ſtock, it ſhould yet, by ſo ſmall a vegetable ſubſtance, be ſo far changed as to conſtitute a fruit quite otherwiſe qualified than the genuine product of the tree; which at the ſame time is actually produced by thoſe other portions of the like ſap, that happened to nouriſh ſuch proſitic buds as are the genuine offspring of the ſtock; ſo that the ſame ſap, which in one part of the branch conſtitutes a cluſter of haws, in another part of the ſame branch may conſtitute a pear. And what is farther remarkable, not only the fruits made of the ſame ſap often differ from one another in ſhape, bigneſs, colour, odour, taſte, and other obvious qualities, but though the ſap itſelf be a watereſh and almoſt inſipid liquor, yet it is not only convertible by buds of ſeveral natures into different fruits, but in one and the ſame fruit, the tranſmuted ſap ſhall by different textures be *made* to exhibit very different, and ſometimes contrary, qualities. As when a peach-bud not only changes the ſap which comes to it, into a fruit very different from that which the ſtock naturally produces, but into parts very different from one another in the *ſame* fruit.

From *inoculation* therefore we learn, that a liquor ſeemingly homogeneous, may, by being variouſly ſtrained, be tranſmuted into bodies endowed with new ſcents, colours, taſtes, ſolidity, medicinal virtues and many other qualities, manifeſt and occult. Boyle's Works abr. vol. i. p. 250.

INOCULATION, in a phyſical ſenſe, is *uſed* for the tranſplantation of diſtempers from one ſubject to another, particularly for the engraftment of the ſmall-pox; which is a new practice among us, but of ancient uſe in the eaſtern countries.

INOCULATION, *the hiſtory of*. It is well obſerved by the baron Dimſdale, that accident hath furniſhed the art of medicine with many valuable hints; and ſome of its greateſt improvements have been received from the hands of ignorance and barbariſm. This truth is remarkably exemplified in the practice of *inoculation* of the ſmall-pox, but to the honour of the Engliſh phyſicians, they *firſt* diſcovered not the value of this practice by the meaneſts of its origin, but by its real importance and utility: they patroniſed a barbarous diſcovery with no leſs zeal and affection than if it had been their own. Indeed, the whole nation might be ſaid to have adopted the practice, for the greateſt encouragad it; by becoming examples; and the wiſeſt were determined by the general event of the method.

As to the origin of the art of *inoculating* the ſmall-pox, as well as the time and place in which it was performed, they are equally unknown to all by whom the practice is adopted. Accident probably gave riſe to it: Pylarini ſays, that among the Turks it was not attended to, except among the meaner ſort. Dr. Ruſſel informs us in the Philoſophical Tranſactions, vol. lviii. p. 142. that no mention is made of it by any of the ancient Arabian medical writers that are known in Europe; and the phyſicians who are natives in and about Arabia, aſſert, that nothing is to be found regarding it in any of thoſe of a more modern date. He farther ſays, that he engaged ſome of his learned Turkiſh friends to make enquiry; but they did not diſcover any thing on this ſubject of *inoculation* either in the writings of phyſicians, hiſtorians, or poets. Until the beginning of the eighteenth century, all the accounts we have of *inoculating* the ſmall-pox are merely traditional. The ſilence on this ſubject, obſerved amongſt writers in the countries where the practice obtained, Dr. Ruſſel ſuppoſes, with great probability, to be owing to the phyſicians there never countenancing or engaging in it. It is alſo remarkable, that before Pylarini's letter to the Royal Society in 1701, nor yet for ſeveral years after, this practice is not noticed by any of the moſt inquiſitive travellers. On this Dr. Ruſſel very juſtly obſerves, that cuſtoms the moſt common in diſtant countries, are often the leaſt apt to attract the obſervation of travellers, who, engaged in other purſuits, muſt be indebted to accident for the knowledge of ſuch things as the natives ſeldom talk of, upon the belief that they are known to all the world.

The firſt accounts we have in the learned world concerning *inoculation*, are from two Italian phyſicians, viz. Pylarini and Timoni, whoſe letters on the ſubject may be ſeen in the Philoſoph. Tranſact. abr. vol. v. p. 370, &c. The firſt is dated A. D. 1701; the next is dated A. D. 1713. Whether our enquiries are extended abroad, or confined to our own country, *inoculation* hath been practiſed under one mode or other, time immemorial; in Great Britain, and its adjacent iſles, we have well authenticated accounts, extending farther backward than any from the continent. Dr. Williams of Haverfordweſt, who wrote upon *inoculation* in 1725, proves, that it had been practiſed in Wales, though in a form ſomewhat different, time out of mind. Mr. Wright, a ſurgeon in the ſame place, ſays, that buying the ſmall-pox is both a common practice, and of long ſtanding in that neighbourhood. He ſays, that in Pembrokeſhire there are two large villages near the harbour of Milford, more famous for this cuſtom than any other, viz. St. Iſhmael's, and Marloes. The old inhabitants of theſe villages ſay, that it hath been a common practice; and that one William Allen of St. Iſhmael's, who in 1722 was ninety years of age, declared to ſome perſons of good ſenſe and integrity, that this practice was uſed all his time; that he well remembered his mother's telling him that it was a common practice all her time, and that ſhe got the ſmall-pox that way; ſo that at leaſt we go back a hundred and ſixty years, or more.

In the Highlands of Scotland, and ſome of the adjacent iſles, Dr. Alexander Monro, ſenior, informs us, that the cuſtom through ages paſt hath been, to put their children to bed with thoſe who laboured under a favourable ſmall-pox, and to tie worſted threads about their children's wriſts, after having drawn them through variolous puſtules.

According to the reſult of Dr. Ruſſel's enquiries, the Arabians aſſert, that the *inoculation* of the ſmall-pox has been the common cuſtom of their anceſtors, and that they have no doubt of its being as ancient as the diſeaſe itſelf. It is remarkable, that buying the ſmall-pox is the name univerſally applied in all countries to the method of procuring the diſeaſe; it is true, that there are other terms; but in Wales and Arabia, as well as many other countries, this is the uſual appellation. From the ſameneſs of the name, and the little diverſity obſervable in the manner of performing the operation, it is probable that the practice of *inoculation* in theſe countries was originally derived from the ſame ſource. From its extenſive ſpread, it is probably of great antiquity too.

In the year 1717, lady Mary Wortley Montague, wife of the Engliſh ambaſſador at Conſtantinople, had her ſon *inoculated* there at the age of ſix years; he had but few puſtules, and ſoon recovered. In April, 1721, *inoculation* was ſucceſsfully tried on ſeven condemned criminals in London, by permiſſion of his majeſty. In 1722, lady Mary Wortley Montague had a daughter of ſix years old *inoculated* in this iſland; ſoon after which, the children of the royal family, that had not had the ſmall-pox, were *inoculated* with ſucceſs; then followed ſome of the nobility, and the practice ſoon prevailed. And here we date the commencement of *inoculation* under the direction of art.

From the example of the royal family in England, the practice was adopted in Germany, particularly in Hanover, and its adjacent countries.

After Mr. Maitland had ſucceeded with thoſe he had *inoculated* in and about London, he introduced the practice into Scotland, in the year 1726.

Sweden ſoon followed the example of the Engliſh; and Ruſſia at this time is engaging one of our principal promoters and improvers of this art. And now there are not many countries that do not more or leſs engage in it.

INOCULATION, *different modes of*. The practice of *inoculation* hath obtained in every part of the world. It may be grateful, at leaſt to curioſity, to be informed of the different modes that are, and have been, of communicating the infection from the ſmall-pox.

Inoculation with the blood of variolous patients hath been tried without effect: the variolous matter only produces the variolous diſeaſe.

The application of the variolous matter takes place in a ſenſible part only; the activity of the virus is ſuch that the ſmalleſt atom, though imperceptible to any of our ſenſes, conveys the diſeaſe as well as the largeſt quantity. Hence, the moſt obvious method is the prick of a needle, or the point of a lancet dipped in the matter of a variolous puſtule.

Cotton, or thread is uſed, that are previouſly rubbed with powdered variolous ſcabs; this thread is drawn with a needle through the cutis, but not left in. This is the method in ſome parts of the Eaſt Indies. The Indians paſs the thread on the outſide of the hand, between any of the fingers, or between the fore-finger and thumb. The Theſſalian women *inoculate* in the forehead and chin.

Some abrade the ſcarf ſkin, and rub in the powdered dry ſcabs which fall from the puſtules of patients with the ſmall-pox.

Many of the Greek women made an oblique puncture with a needle, on the middle of the top of the forehead, on each cheek, the chin, each metacarpus, and each metatarſus;

tatarfus; then drop in each a little of the pus juſt taken warm from a patient, and brought in a ſervant's boſom. Others in Greece make ſeveral little wounds with a needle in one, two, or more places in the ſkin till ſome drops of blood enſue; then the operator pours a drop of warm pus freſh from a puſtule, and mixes it with the blood as it iſſues out; then the wound is covered by ſome with a bandage, by others with half a walnut-ſhell, placed with its concave ſide over each orifice.

The Chineſe convey a pellet of variolated cotton, with the addition of a little muſk, into the noſtrils of the patient; they collect dry puſtules, and keep them in a porcelain bottle well corked; and when they *inoculate*, they mix a grain of muſk with three or four grains of the dry ſcales, and roll them in cotton. This method may be called *inſtantaſian*.

About Bengal, in the Eaſt Indies, the perſon who intends to be *inoculated*, having found a houſe where there is a good ſort of the ſmall-pox, goes to the bed of the ſick perſon, if he is old enough; or if a child, to one of his relations, and ſpeaks to him as follows: "I am come to "buy the ſmall-pox." The anſwer is, "Buy if you "pleaſe." A ſum of money is accordingly given, and one, three, or five puſtules, for the number muſt always be odd, and not exceeding five, are extracted whole, and full of matter. Theſe are immediately rubbed on the ſkin of the outſide of the hand between the fore-finger and the thumb; and this ſuffices to produce the diſeaſe. The ſame cuſtom obtains in Algiers, Tunis, Tripoli and other countries.

Very ſimilar to the cuſtom among the people about Bengal, &c. is that in Arabia, where, on ſome fleſhy part they make ſeveral punctures with a needle imbrued in variolous matter, taken from a puſtule of a favourable kind. Here they buy the ſmall-pox too, as follows: the child to be *inoculated* carries a few raiſins, dates, ſugar-plums, or ſuch like; and ſhewing them to the child from whom the matter is to be taken, aſks, how many pocks he will give in exchange? The bargain being made, they proceed to the operation; but this buying, though ſtill continued, is not thought neceſſary to the ſucceſs of the operation. The Arabs ſay that any fleſhy part is proper; but generally they inſert the matter between the fore-finger and thumb on the outſide of the hand.

The Georgians inſert the matter on the fore-arm.

The Armenians introduce the matter on the two thighs.

In Wales, the practice may be termed infriction of the ſmall-pox. There, ſome of the dry puſtules are procured by purchaſe, and are rubbed hard upon the naked arm or leg.

The practice in ſome places is to prick the ſkin between ſome of the fingers by means of two ſmall needles joined to one another; and after having rubbed a little of the matter on the ſpot, a circle is made by means of ſeveral punctures of the bigneſs of a common puſtule, and matter is again rubbed over it. The operation is finiſhed by dreſſing the wound with lint.

Another cuſtom is to mix a little of the variolous matter with ſugar, and give it to be drank in any agreeable liquor.

Inciſions have been made in the arms and legs, and thread, cotton, or lint, previouſly dipped in the variolous matter, was lodged in them.

The practice of ſome is to bathe the feet in warm water, and then ſecure lint dipped in the variolous matter, on the inſtep, or other part of the foot, where the ſkin is thin.

Others apply a ſmall bliſtering plaſter; and when the ſcarf ſkin is elevated and ſnipped off, the variolous matter is applied to the ſurface of the true ſkin, and confined there by a little lint or plaſter.

Scratching the ſkin with a pin or needle, and then rubbing the part with lint, previouſly dipped in variolous matter, is the cuſtom in ſome places.

In the Highlands of Scotland they rub ſome part of the ſkin with freſh matter, or dip worſted in variolous matter, and tie it about the children's wriſts. They obſerve, that if freſh matter is applied a few days ſucceſſively, the infection is more certain than by one application.

INOCULATION, *objections to, anſwered.* 1. It is not lawful. In anſwer to this, the Scriptures aſk, Is it lawful to ſave life, or to deſtroy it? Luke vi. 9. And as it is a difficulty with many ſerious people, whether to admit of this practice or not, this objection ſhould be conſidered in a religious view. We ſhould in this caſe remember, that as the fall of man brought the danger of diſeaſes into the world, ſo to evade, oppoſe, or deſtroy it, is not only his right, but duty, if in his power. And if events imply the cauſe, a long run of uninterrupted ſucceſs implies an efficacious remedy. Though ſome die under this management, it is ſufficient to prove the lawfulneſs of a remedy, that it is proper for, and hath by experience been found in moſt caſes effectual to the end for which it was uſed. When danger ſurrounds us, the conduct is more proper than to enquire into, and purſue the means of eſcape. To neglect our ſafety is to ſink below the brutes, who by inſtinct avoid the evil to which they are expoſed. *Inoculation* is a means of ſaving life in many inſtances, and of moderating the ſeverity of affliction in more. Wilfully then to neglect the means of ſaving life is to be guilty of murder.

2. It is bringing a diſtemper on ourſelves, and ſo uſurping the ſacred prerogative of God.

As to the firſt part of this objection, if by diſtempers are meant ſickneſs and pain, that is practiſed daily in other inſtances, in concurrence with the Scripture dictate, *viz.* of two evils chuſe the leaſt. But the ſuppoſition of objectors in this inſtance is not altogether true; for, by *inoculation*, a diſeaſe is not properly ſaid to be communicated; it only excites and frees us from one, which, though latent, is already in us: or, which in effect is the ſame, *inoculation*, by an advantageous mode of infecting, &c. frees the patient in *all inſtances* from the uſual difficulties of the diſeaſe; *ſaves the life* of moſt who ſubmit to it; and with the natural ſmall pox *it deſtroys that diſpoſition* in the body, without which the diſeaſe cannot take place. It is owned that ſome hazard attends it: it is ſometimes mortal, and indeed it is fit it ſhould be ſo; it is generally ſucceſsful, that encourages us to proceed; it ſometimes, though rarely fails; hence we are cautious and careful, and led to act with a dependence on him, to whom belong the iſſues from death.

Reſpecting the offence given to God; a reliance on Providence does not imply that we are not to prevent or oppoſe the evils which we foreſee, and which we have in our power to guard againſt by prudent precautions. Would theſe objectors, in other inſtances, refuſe the means of leſſening the malignancy and danger of diſeaſe, than which the practice of *inoculation* is no more? Let the aſſerters of the rights of God ſay, whether, when God permits the diſcovery of preſerving ourſelves from an impending evil, he forbids our uſing it? If our Maker offers us a remedy, it is offending him to reject it.

3. The decrees of God have fixed the commiſſion of every diſeaſe, and our precautions cannot prevent what he hath determined.

However true it is, that our days are determined, &c. yet it is God's revealed will, and not his ſecret purpoſes which we are to regard as the rule of duty. God hath required of us to have a tender regard to our lives; and thoſe who diſobey him herein, are guilty of a degree of ſelf-murder, and will never be acquitted of that guilt, by the ſecret determination of Heaven concerning them. Beſides, God who hath ordained the end, hath alſo determined the means leading to it. St. Paul in his dangerous voyage, had a ſpecial revelation to aſſure him, that all who were with him ſhould eſcape; and yet, when the ſeamen were getting out of the ſhip, he declares, that if they did not ſtay in it, they could not be ſaved. Acts xxvii. 31. God purpoſed to preſerve them in the way whereby they were afterwards delivered.

4. We ſhould not do evil that good may come.

If *inoculation* is in its own nature a moral evil, it certainly ſhould be rejected, however great its advantages may ſeem to be. The proſpect of relief from any calamity in life ſhould not tempt us to offend God. But thoſe who make this objection, proceed on a miſtake. Their principle is true with regard to moral evil, but is not ſo when applied to phyſical. It is certainly lawful to pull down a houſe, to ſave a great number from being burnt; this is a phyſical evil, which can hardly take place without ſome degree of moral evil; and many other inſtances may be pointed out, where for a greater good, a leſſer ill is ſubmitted to. And is the ſmall ill induced by *inoculation* to be compared with all thoſe evils which are tolerated and authorized by all laws?

5. The patient may die; and then his laſt moments are diſtreſſed; and the future reflections of his friends are grievous.

This objection leads many to decline the practice of *inoculation*, even when they allow the theory of it to be reaſonable. They hope to eſcape the diſtemper in the natural way, and they have fears of dying in this, and thus they are prevented from going into it. But they ſhould conſider what grounds they have for either the one or the other, and what is to be advanced to balance the account, by examining the different degrees of probability that attend their hopes and fears, to the uſe or neglect of *inoculation*. Dying is a ſerious thing; but if *inoculation* be a *probable and lawful* means of preſerving life in a time of danger, it is a duty to comply with it; and whatmore peaceful reflection than to die in the way of duty?

6. Fear is a dangerous paſſion in the ſmall-pox; but *inoculation* increaſes the cauſes of fear, by leſſening our faith and truſt in God.

When the ſmall-pox is left to nature, ſuch are its ra-

rages, that not to fear, would be to sink beneath humanity: its consequences are too grievous to be treated with neglect. But exorcitance manifests the safety that attends receiving the disease by *inoculation*; it is therefore safer a remedy to shun just fear, which enhances the danger, when the disease is left to itself. As to faith in God, none is desirable but that which is agreeable to the Scripture; and a disregard to calamities and dangers are never the effect of that. *Inoculation* is a means of safety; and it is as rational to conclude, that our lives should be preserved without eating and drinking, as that we shall be delivered from danger without a prudent care for our own safety. We are to depend on the care of Providence only in the way of duty. To boast of courage and trust in God, while we omit the means of escaping danger which surrounds us, is not faith, but presumption.

Thus, when *inoculation* becomes a probable means by which to save life, it is a presumption, and not trust, to neglect it.

7. *Inoculation* does not exempt from future infection.

If by *inoculation* of the small pox, the same disease is produced, the same effects may be expected from it when artificially produced as in the natural way. It is inconceivable, that a contagious substance, the very seminal matter of the small pox, should propagate, instead of its own, another disease. Dr. De Haen is an acute physician, and was a violent opposer of *inoculating* the small-pox; but he never supposed that the matter of the small pox will produce any disease but itself. Observation alone determined the opinion, that the natural small pox does not attack a second time: the same stands good in favour of the artificial disease. Add to this, numberless trials have been made without effect, to reinfect those in whom the small-pox had taken place by *inoculation*.

8. Other diseases are communicated with the matter of the small-pox, by *inoculating* it.

That care, skill, or willfulness in the operator may in some instances give cause for this objection, is true; but, that by the matter of a variolous pustule, any other disease hath been conveyed, is yet to be proved. As the confluent and malignant small-pox have not yet been observed to produce their own degree and mode of this distemper, when infused by *inoculation*, it is scarcely conceivable that they should transmit another disease, essentially different. The venereal disease is known to be communicable as any, yet several have been *inoculated* from patients labouring under considerable degrees of the venereal disease, and no ill consequences ever yet were known to follow, none to give the least suspicion of the kind. If the variolous matter may convey another disease in the artificial, it may do the same in the natural way; and even then, advantage is attendant on *inoculation*, for we can chuse a healthy person to take the infection from; but no influence of the kind hath ever occasioned.

9. Perhaps the disease may never attack in the natural way.

Such objectors should be informed, that this distemper cannot be given to one who never would have it; for they only who are susceptible of it can take it by *inoculation*, as is evident from numerous experiments made to verify this fact. Again, the small-pox may be said to be general; for few there are who are exempted from it, that they can hardly be considered as an exception to the general law; and it is worth while to *inquire*, first, to ascertain the safety of the individual from this disease; and, secondly, on account of the general advantages of this practice, in case he should be susceptible of the infection. On this subject Dr. Jurin hath inserted an ingenious paper in the Philosophical Transactions; in which he observes, that it is difficult to ascertain the exact number who die without having the small pox; but that, of all the children that are born, there will some time or other die of the small-pox one in fourteen; and that of persons of all ages taken till of the small-pox, there will die togeiby two in eleven.

From a table of burials it appears, that in Edinburgh and St. Cuthbert's parish, during ten years, about one-tenth of the dead were killed by the small-pox.

Further, as it cannot be known that any individual is exempted from the small-pox, his hazard of dying of that distemper, being made up of the hazard of having it, and the hazard of dying of it if he has it, will be exactly the same, viz. that of one in eight or nine; whether the proportion of mankind that escape having the small-pox be great or small.) In enquiry from house to house for the number of people with the small pox, in several towns, during one year, it appeared that near one in five died who had them; and that of eighty-two persons who were inoculated in those places in the same year, not one died.

10. It requires much thought to know what we should do with regard to *inoculation*.

Not to dwell on the absurdity of this objection, and of complaining that consideration is a burden, when it is necessary for the preservation of life, it may suffice to point out, that a sacred writer tells us, that a prudent man foreseeth the evil, and hideth himself; but fools pass on, and are punished.

11. It endangers others.

Since very few of mankind now escape the small-pox, it must sooner or later come to every place; therefore, if it is true in fact that a much greater number lose their lives by the natural than by the artificial infection, it is of more service to introduce the small-pox in a favourable way and season, than passively to allow them to destroy multitudes. As to spreading the disease, by introducing *inoculation*, it is but of little consequence: for *inoculating* where the disease does not already exist, is chiefly circumstanced from this practice, where it already prevails in the natural way; the quantity of the circumambient contagion is less, or the same extent of atmosphere is less impregnated with the infectious principles from *inoculated* patients than when it naturally prevails, or the same number of people received it in the natural way.

The most plausible objection on this account is Dr. Rast, of Lyons, in France. From his review of the bills of mortality in and about London, he observes, "that more "have died by the small-pox in London since the introduction of *inoculation*, than in the same time preceding that period, in consequence of the disease there "by being more universally extended and propagated." But to this, Dr. Letterman most satisfactorily replies, "That the late increase of burials cannot depend upon "the practice of *inoculation*, under which, though it is a "rare thing to hear of a fatal case, but rather upon the "innovation introduced in the treatment of the natural "small-pox of exposing the patients to the open air, and "a less reserved intercourse enjoyed by the community." This, with the improvements in medicine in various instances, the police of the city, &c. which by preserving many lives, occasion more subjects for the small-pox, and consequently a proportional increase of deaths by this disease; many of those who are preserved by the above named improvements not being favoured with the advantages of *inoculation*. "Besides the care taken in and about "London to prevent inconvenience from *crowding*, "&c. it should be remembered, that the increase "of those of young persons to the capital from the "country, easily accounts for the increase of 19 deaths in "1000, more than formerly happened." See a Defence of *Inoculation*, in Dr. Latham's Medical Memoirs.

12. The practice of *inoculation* comes from the devil.

The best answers to this reason to be, first, that cavillers will never cease from objecting; and oppositions will be made as long as there are men of wit to devise, or of fertility to invent. Secondly, that Job was afflicted by the devil with the small-pox, is not a known fact. Thirdly, that it by what is said, the principal objections are removed, it is hoped that the reasonable and the religious will be enabled to approve themselves to God in the practice of *inoculation*. See a discussion of most of the preceding objections in an excellent pamphlet, entitled, *Inoculation* impartially considered, and proved to be consistent with Reason and Revelation, by the Rev. Mr. David Some, published by Dr. Doddridge in 1750.

INOCULATION, *advantages of*. Though no disease after it is formed baffles the powers of medicine more than the small-pox, yet none may be done so much to render this disease favourable than in any other we know. The artificial method of producing the small-pox hath also oft stripped it of its terrors; in general, hath rendered its aspect mild, its progress uniform, and nearly without hazard to the patient.

Mr. Mudge, in his Dissertation on the inoculated Small-pox, enumerates the following sources of danger from this disease, viz. 1. The patient's constitution. 2. The propensity of the patient to be infected. 3. The manner or mode of the infection being communicated. 4. The constitution of the air at the time of infection. And, it is the advantage of *inoculation*, if prudently conducted, almost totally to exempt its subjects from the disadvantages attendant on these sources.

1. Respecting the habit of body, or state of the patient's constitution at the time of infection.

Constitutional or habitual diseases, in general, do not interfere with the course of the small-pox, whether in its natural or its artificial progress; such as torbutic eruptions on the skin, strumous complaints, itch, scabby eruptions, excoriated ears, &c. The variolous poison is therefore a thing, sui generis, and no ways affected by those taints of the juices, or what is usually called a bad habit of body; or at least so inconsiderably, as not to deprive such patients of any of the advantages of *inoculation*. But the case is much reversed with respect to some accidental

diſeaſes. E. gr. If on the attack of the ſmall-pox, the habit, or its attending circumſtances, tend to inflammation, or, on the contrary, to a putrid acrimony, the eruptive fever in theſe aggravated ſtates, will load the body with variolous matter, or produce puſtules of a very unfavourable kind; in either of theſe caſes (not to enumerate more) the patient will moſt probably be ſeverely affected.

But *inoculated* ſubjects may be infected when the conſtitution is in the beſt condition to combat with the diſeaſe; if either of theſe diſpoſitions are attendant, or any other which uſually endangers, they may ſoon be reſtrained or removed.

2. The different degrees of propenſity in the patient at different times to be infected.

That different quantities of matter are produced in different perſons in the proceſs of the diſeaſe, we find true in fact; and there is the ſtrongeſt reaſon to believe, that previous to infection, the quantity of the variolous matter, or rather that principle in the conſtitution, which eventually produces it, ebbs and flows, is more or leſs vigorous at different times in the ſame ſubject, under various combinations of circumſtances. The inſtances are not uncommon, where the patient who hath withſtood at one time all the ordinary means of infection, nay, who hath induſtriouſly, but ineffectually ſought it; yet at another hath had a ſmall-pox ſo malignant in appearance and effect, that the whole body hath been converted into an offenſive variolous putreſcence. If the degree of propenſity to receive infection was always the ſame, it would be inconceivable that any one could paſs unaffected, when the ſmall-pox became epidemic. From whatever cauſe, however, this propenſity may ariſe, it is moſt reaſonable to aſſert, that the increaſe or decreaſe of this principle takes place according as the ſmall-pox is epidemic or not. During the continuance of any contagious epidemic diſeaſe, we always find that thoſe conſtitutions which are moſt congenial with that character, are peculiarly obnoxious to the correſpondent diſtemper. And we may reaſonably conclude, that when the conſtitution of a perſon not paſſed the ſmall-pox is moſt ſaturated with the variolous principle, he is then more particularly ſubject to infection. Again, it is not only undoubted, that the variolous principle ſubſiſts in the conſtitutions of perſons not paſſed the ſmall-pox, but is more than probable, that a part of this principle is produced by the eruptive fever, and the reſt of the variolous proceſs. Agreeably to what hath been ſaid, we find, that during the epidemic tendency, thoſe who have not paſſed the diſeaſe, are more open to contagion than in other conſtitutions of air, when the ſmall-pox is not epidemic, and is conſequently a rare diſeaſe. Many who have eſcaped infection from *inoculation*, and other means of contagion, on removal into a ſituation where the ſmall-pox has been epidemic, have preſently after been ſeized with this diſorder. Events of this kind are ſo common, as to have given riſe to the ill grounded opinion, that any change of air is hazardous to thoſe who have not had the ſmall-pox. If at a time when the propenſity to be affected is the greateſt, there ſhould be a concurrence of thoſe ſtates of the conſtitution above noticed, how aggravated will the condition of the patient be.

Reſpecting the evaſion of theſe inconveniences by *inoculation*, it is to be obſerved, that as the propenſity to the diſeaſe differs at different times in the ſame ſubject, it is reaſonable to ſuppoſe that the diſorder is produced by downright violence, when there ſubſiſts in the patient but little of that peculiarity of conſtitution, ſo eſſential to the production of the diſeaſe (and ſo general, when the ſmall-pox is epidemical) or, in other words, when the body is indiſpoſed to be poiſoned. This conſideration peculiar to the diſeaſe, when artificially produced, appears to be the true cauſe of the ſmall quantity of pocky matter, and that general ſcarcity of puſtules, when compared to the natural ſmall-pox, which has ever accompanied *inoculation*, and is one of the grand advantages of the diſcovery. Farther, as it is very reaſonable to ſuppoſe, that this propenſity is the greateſt when there is an epidemic conſtitution of the air, which favours the production of the diſeaſe; and if it be as probable that the ſeverity or mildneſs of the diſeaſe depends in a good degree upon the greater or leſſer propenſity of the ſubject to be infected, it will certainly be an eligible ſtep not to bring on the diſorder by *inoculation*, during the continuance of an evidently prevailing tendency to the diſeaſe. Prudence in this caſe directs us to take advantage of the abſence of ſuch a prevailing tendency, when all the benefits of *inoculation* may be ſecured, and not delay the operation, till ſuch a conſtitution of air prevails as at once makes the operation neceſſary, and deprives it of ſome of its advantages. To conclude, we may add to this conſideration, that by the practice of expoſure to cold, the violence of the eruptive fever is ſo far moderated, as to prevent its forming an additional quantity of variolous matter, which, in a violent and unreſtrained ſtate, it would do, by aſſimilating the juices of the conſtitution into the nature of the variolous poiſon.

3. The manner or mode of the infection being communicated.

In the natural ſmall-pox, the diſeaſe may be produced by an accidental contagion, or an epidemic influence. Dr. Mead ſays, that the air of this climate never produces the plague, ſmall-pox, or meaſles; and Dr. Arbuthnot ſays, that the plague itſelf may be generated by ſome quality in the air, without any contagion. Be theſe opinions as they may, it is evident that contagion is ſometimes ſo languid, that it requires the agency of other cauſes to give it activity, ſo as to produce the tribe of diſeaſes to which it belongs, and which without this agency would never be brought forth; and though the ſtrongeſt epidemic tendency may not in Europe create the ſmall-pox, without the concurrence of contagious fomes, yet there is, by the agency of the former, ſuch an alteration made, and propenſity brought on the animal juices, as is eſſentially neceſſary to continue the exiſtence of the diſeaſe. Variolous contagion produces its effects by the actual application of its poiſon, either externally, through the medium of the ſkin, or internally, to the gullet, ſtomach, and guts, in the act of deglutition; or laſtly, to the lungs, in the act of reſpiration. Though there may be a poſſible admiſſion of the poiſonous miaſmata into the conſtitution through the ſkin, from the principle of abſorption, yet the poiſon, very ſeldom, if ever, exerts its influence upon the habit in this manner; poſſibly by a local actual application of the gems matter lodged in the cloaths, or otherwiſe conveyed, the diſtemper may ſometimes be produced by a kind of *inoculation*, and then the diſorder will probably be favourable. But when the poiſon, in a more diffuſe ſtate, only floats in, or impregnates the air, it ſeldom enters the pores of the ſkin, and poiſons by way of abſorption; for the degrees of activity in which this power is exerted, are moſt probably in proportion to the aids the conſtitution may ſtand in need of from it. However, it is more than probable that the ordinary mode of infection is by the lungs, which from their ſtructure they are well calculated to receive, to entangle, and to retain. When either the lungs or the ſtomach are firſt infected by the infectious effluvia, it is moſt reaſonable to believe, that theſe noble parts, together with the fauces, glottis, wind-pipe, and gullet, will frequently labour under a greater load of puſtules, than the external ſurface of the body; for it is obſerved that when the patient is infected artificially, the parts to which the poiſon is applied, ſuffer in a greater degree than the more diſtant; and that the circumjacent ſkin, to ſome extent, is filled with puſtules. From this particular application of the morbid matter to the fauces, &c. it is probable, that the large diſcharge of ſaliva, &c. ariſes, which characteriſes the conſluent ſmall-pox in adults; and as children ſwallow this ſaliva it excites a diarrhœa, which in them anſwers to the ſpitting in thoſe more aged. When the internal parts are oppreſſed with puſtules, there is no interval between the eruptive and the ſubſequent ſymptomatic fever; and the ſuffering which the patient labours under from a generally inflamed ſkin, heightened by the diſeaſed condition of the noble parts, perpetuates the firſt fever. This informs us that all is not ſo well within, as otherwiſe the external appearances might have induced us to believe; but that the nobler parts are rendered unfit for the purpoſes of life, at leaſt are labouring and lagging behind in the proceſs, ſo that they have not kept pace with the apparent ſtate of the diſeaſe on the ſurface of the body; this ſome have ſuppoſed to be the true general cauſe of the ſecondary fever, under which the patient, if he ſinks, dies peripneumonic. Theſe conſequences frequently attend the infection received in the natural way, and if, ſuperadded to theſe, the unhappy ſituation of thoſe deſcribed under the firſt and ſecond ſources of danger attends the patient, the diſorder will be proportionably aggravated, and the chance of life leſſened.

But here again *inoculation* relieves; for by this mode the virus is applied to the external ſurface of the body, ſo that the whole conſtitution (excepting the part immediately ſurrounding the wound) being affected uniformly, the proceſs of the diſeaſe is regularly carried on, and the nobler parts not being particularly affected by a partial application of the variolous fomes to their ſurface, have no diſtreſs to proclaim by a ſecondary fever, which is therefore ſcarcely ever ſeen in *inoculated* patients.

4. The conſtitution of the air at the time of infection.

A powerful ſource of difficulty and danger in the habitual ſmall-pox, is the malignant influence of the air at ſome ſeaſons, and particularly if it happens at the time of receiving the infection. If this concurs with one or

more of the other sources, how dreadful the devastation. Whether this constitution of the air produces its deleterious effects by heightening the natural malignity of the infecting poison, or acts on the constitution itself, so as to render the effects of contagion more peculiarly fatal, the consequence of this state of the air is the same. The general characters of a morbid state of the air, are the inflammatory and putrid; and it is uniformly observed, that whenever a person is attacked with a fever, under either of these prevailing dispositions, it never fails to impress its character upon the disease.

But here also *inoculation* affords the most benign influence. The judicious practitioner does not expose his patient to the pernicious effects of an air that can stamp its baneful character on the small-pox; but chuses the season best calculated for the safety and welfare of his patient; and hence we rarely see the influence of this evil source attendant on the artificial disease.

Having seen, that from the influence of one or more of these four sources of difficulty and danger, and that from their union will result a natural small-pox, complicated with horrors not less to be dreaded than the plague, how inestimable must appear that favour of Providence, by which we are freed from the formidable attendants of this disease, viz. *inoculation*, by which the disorder is rendered mild, and in general less hazardous than a common cold.

From attention to the above sources of ill in the natural small-pox, we are led to see, with sufficient satisfaction, the many instances of relief and security which generally we avail ourselves of by *inoculation*; a part of which we have seen, and a few others follow.

As already observed, it saves the lives of most who are its subjects.

From a general calculation it appears, that in the hospitals for small-pox and *inoculation*, 72 die out of 300 patients having the distemper in the natural way, and only one out of this number, when *inoculated*.

It lessens the affliction from both the degree, and the number of ill symptoms, even when it proves fatal.

It lessens the number of pustules; and by moderating the virulence of the disease, the marks on the face are not so deep.

It is extremely rare that the secondary fever attends it; a symptom productive of much suffering, if the patient is happy enough to escape with life.

It produces the disease under the fewest disadvantages, and favours with foresight to prevent many ills, not to be guarded against in the natural small-pox.

Instead of communicating other disorders with it, many disorders subsequent to the natural, are very rarely observed after the artificial small-pox.

It effectually removes all just grounds of fear; a passion very injurious to this disease.

Soldiers, sailors, and all who would appear abroad, or, in public offices, are freed from every anxiety and hazard, attendant on the natural small-pox.

Servants, women with children at their breasts, pregnant women, magistrates, physicians, &c. are all freed from the most distressing embarrassment, by conformity to *inoculation*. See *Small-Pox*.

INOCULATION, *hospital for*. See HOSPITAL.

INORDINATE *proportion*, is where three magnitudes being in one rank, and three others proportional to them in another, you compare them in a different order.

E. gr. If there be in one rank these three numbers, 2, 3, 9; and in another rank, these other three, 8, 24, 36, which are proportional to the precedent, in a different order; so that 2 be to 3 as 24 to 36, and 3 to 9 as 8 to 24; then calling away the mean terms in each rank, you conclude the first 2 in the first rank to be to the last, 9; as 8, the first of the other rank, to the last, 36.

INOSARCION, in *Natural History*, a name given by the old Greek and Roman authors to a peculiar species of emerald, called also by some the Chalcedonian emerald. The great distinction of this from all the other kinds of this gem, was its not being of the pure, clear, and unvarying colours of the others, but having thick veins in it, which gave peculiar refractions and reflections to the light; and though the stone was in itself wholly green, yet when viewed in side lights, these veins gave all those changeable colours that ornament the feathers of a peacock's tail, or the neck of a pigeon.

INOSCULATION. See ANASTOMASIS, and ARTERY.

IN PACE, a Latin term, used among monks, to signify a prison, where such of them are shut up as have committed any grievous fault.

Formerly, there used to be a great deal of ceremony at the putting a religious *in pace*; but now it is not much regarded. Such as are shut up in perpetual imprisonment, are also said to be *in pace*.

Sometimes, also, the words *requiescat in pace* are used by way of allusion to a custom in the Romish church, of praying that the soul of the defunct may rest in peace. The same words are also frequently seen at the bottom of epitaphs, in lieu of these used by the ancient Romans, S. T. T. L. i. e. *Sit tibi terra levis*, *Light lie the earth*; or, *Sit humus cineri non onerosa tuo*.

IN PALE. See PALE.

INPROMPTU, or INPROMPTU, a Latin word frequently used among the French, and sometimes in English, to signify a piece made off-hand, or extempore, without any previous meditation, by the mere force and vivacity of imagination.

INQUEST, or ENQUEST. See ENQUEST, ARREST, and JURY.

INQUIRENDO, an authority given a person or persons, to inquire into something for the king's advantage.

INQUIRENDO *idiota*. See IDIOTA.

Ad INQUIRENDUM. See AD INQUIRENDUM.

Melius INQUIRENDUM. See MELIUS, &c.

INQUISITION, in the *Civil* and *Canon Law*, a manner of proceeding for the discovery of some crime by the sole office of the judge, in the way of search or examination.

INQUISITION is also used, in *Common Law*, for a like process in the king's behalf, for discovery of lands, profits, and the like.

In which sense it is also confounded with OFFICE.

INQUISITION, or the *Holy Office*, denotes an ecclesiastical jurisdiction established in Spain, Portugal, Italy, &c. for the trial and examination of such persons as are suspected to entertain any religious opinions contrary to those professed in the church of Rome.

It is called *inquisition*, because the judges by their office take cognizance of crimes on common report, without any legal evidence, except what they themselves are able to explore.

Some people fancy, they see the original of the *inquisition*, in a constitution made by pope Lucius, at the council of Verona, in 1184, where he orders the bishops to get information, either by themselves, or by their commissaries, of all such persons as were suspected of heresy; and distinguishes the several degrees of suspected, convicted, penitent, relapsed, &c. However this be, it is generally allowed, that Pope Innocent III. laid the first foundation of the *Holy Office*; and that the Vaudois, and Albigenses, were the first objects of it. That pontiff, the beginning of the thirteenth century, sent Raimond Cisterciian monk, and Pierre de Castelnau, archdeacon of Magueloune, to the country of Thoulouse, or Languedoc, in order to blow up a spirit of zeal and persecution amongst the prelates and princes. These missionaries were soon followed by others, among whom was the famous Spaniard, Dominic, founder of the order of Preachers, who, returning from Rome in the year 1206, fell in with these delegates, embarked in their cause, and laboured, both by his exhortations and conduct, in the extirpation of heresy. These spiritual champions were to give an account to the pope of the number of heretics in those parts, and of the behaviour of the princes and persons in authority to them; and thence they acquired the name of *inquisitors*: but these original *inquisitors* had not any court, or any authority; they were only a kind of spiritual spies, who were to make report of their discoveries to the pope, and to excite the catholic princes and people to extirpate heretics.

It has been generally said, that the tribunal of the *inquisition* was the invention of St. Dominic, and first erected by him in the city of Thoulouse; that, consequently, he was the first inquisitor; and that, although the year of its institution is uncertain, it was undoubtedly confirmed in a solemn manner by Innocent III. in the council of the Lateran, in the year 1215. See Limborch's Hist. of the *Inquisition*, by Chandler, book i. chap. 10.

This account is contested by Mosheim, who maintains, that St. Dominic was not appointed by the Roman pontiff to proceed judicially against heretics, and such as were suspected of heresy, to pronounce sentence according to their respective cases, and to deliver over to the secular arm such as persisted obstinately in their errors, and therefore, in this sense, was no inquisitor; though, according to the original meaning of the term, he was invested with the commission and authority of the Roman pontiff to extirpate heresy, and oppose its abettors, but without any judicial power: nay, it is farther urged, that the court of *inquisition* was not erected during the life of St. Dominic. The horrid war, which was excited by Innocent III. against the Albigenses in Narbonne Gaul, and which was carried on by the cross-bearers with the utmost cruelty from the year 1209 to 1220, when a treaty of peace took place between Raymond VIII. earl of Thoulouse, and Lewis VIII. king of France, which gave a mortal blow to the cause of heresy, prepared the way for the full establishment of the *inquisition*. Inquisitors

sitors of the first kind had, in the course of this time, been placed in almost every city, whose inhabitants had the misfortune to be suspected of *heresy*, notwithstanding the reluctance which the people manifested to this new institution, and the violence with which they frequently expelled and sometimes massacred these bloody officers of the popish hierarchy. At length, the council held at Thoulouse, in the year 1229, by Romanus, cardinal of St. Angelo, and pope's legate, went still farther, and erected in every city a council of inquisitors, consisting of one priest, and three laymen. This institution was, however, superseded in the year 1233, by Gregory IX. who entrusted the Dominicans, or Preaching Friars, with the important commission of discovering and bringing to judgment the heretics that were lurking in France; and in a formal epistle discharged the bishops of that painful office. Immediately after this, the bishop of Tournay, who was the pope's legate in France, began to execute this new resolution, by appointing Pierre Cellan and Guillaume Arnaud, inquisitors of heretical pravity at Thoulouse; and afterwards proceeded in every city, where the Dominicans had a convent, to constitute officers of the same kind, chosen from among the monks of that order. From this period we are to date the commencement of the dreadful tribunal of the *inquisition*, which in this and the following ages subdued such a prodigious multitude of heretics, part of whom were converted to the church by terror, and the rest committed to the flames without mercy. For the Dominicans erected first at Thoulouse, and afterwards at Carcassone, and other places, a tremendous court, before which were summoned not only heretics, and persons suspected of heresy, but likewise all who were accused of magic, sorcery, Judaism, witchcraft, and other crimes of that kind. This tribunal, in process of time, was erected in the other countries of Europe, though not every where with the same success. The method of proceeding in this court of *inquisition* was at first simple, and almost in every respect similar to that which was observed in the ordinary courts of justice. But the Dominicans modelled it after that of the tribunal, called in the Roman church the tribunal of peace; and hence arose that strange system of inquisitorial law, which, in many respects, is so contrary to the common feelings of humanity, and the plainest dictates of equity and justice. And that nothing might be wanting to render the spiritual court formidable and tremendous, the Roman pontiffs persuaded the European princes, particularly the emperor Frederic II. and Lewis IX. king of France, not only to enact the most barbarous laws against heretics, and to commit to the flames those who were pronounced such by the inquisitors, but also to maintain the inquisitors in their office, and grant them their protection in the most open and solemn manner. The edicts issued to this purpose by Frederic II. are well known; edicts every way proper to excite horror, and which rendered the most illustrious piety and virtue incapable of saving from the most cruel death such as had the misfortune to be disagreeable to the inquisitors. The laws of Frederic, in relation to the inquisitors, may be seen in Limborch's History of the *Inquisition*, book i. chap. 12.

The edict of St. Lewis, in favour of these ghostly judges, issued out in the year 1229, is generally known under the title of *Capcentes*.

After the death of Frederic, who had long before repented the power he had given the churchmen, as having been some of the fruits of it, pope Innocent IV. erected a perpetual tribunal of inquisitors, and deprived the bishops and secular judges of the little power the emperor Frederic had left them. And this jurisdiction, which depended immediately upon himself, he took care to introduce into most of the states of Europe. In 1251 it was established in Italy; in 1255 Alexander IV. appointed inquisitors in France, at the request of St. Lewis. But the inquisitors were so fiery hot, and made such horrible butchery among the reputed heretics, that they raised an universal detestation even in some catholic countries themselves. Hence it was that their reign proved very short both in France and Germany; though they were occasionally exerting themselves; and their power was established in many parts of France and Germany about the time of the reformation by Luther; but afterwards gradually declined. Nor was even Spain entirely subject to them till the time of Ferdinand and Isabella, when their power was increased, under pretence of clearing the country of Judaism and Mahometanism.

The *inquisition* was first introduced into Spain in the year 1478; but the first inquisitor-general, and the supreme council of the *inquisition*, were not fixed till the year 1483. This tribunal is arisen to such a height in Spain, that the king of Castile before his coronation subjects himself and all his dominions, by a special oath, to the most holy tribunal of the *inquisition*. It is under the direction of an inquisitor-general, appointed by the king, and confirmed by the pope; and this *inquisition* has power to name particular inquisitors in every place where there is any tribunal of the *inquisition*.

The *inquisition* was established in Portugal, at the pressing solicitation of king John III. about the year 1536; and both the Spaniards and Portuguese have established it in their territories in the western continent.

The power of the *inquisition* is very much limited in some countries, particularly at Venice, where it was introduced about the year 1289, and where it is received under such modifications, as prove a great check on its authority; the office consisting of secular and ecclesiastical persons, though the latter have been long endeavouring to bring it into their own hands, but could never prevail with the Venetian senate to agree to it. Indeed at Venice it seems rather a political than a religious contrivance; and serves rather for the security of the state, than that of the church. There are appeals from the subaltern *inquisition* in Italy, to the congregation of the holy office residing at Rome.

This CONGREGATION was first formed by Paul III. in 1542, but finally established by Sixtus V. in 1588. The members of it, called supreme inquisitors, assemble thrice in the week, and every Thursday in the presence of the pope, who presides in it.

The officers or ministers of the *inquisition* are the inquisitors, who derive their power from the pope, either by word of mouth, or by his apostolic letters, and can be removed only by him, or by authority conferred by him on those cardinals who are the inquisitors general; vicars general, who manage the affairs of the *inquisition*, during the absence of the inquisitors; assessors and counsellors, who give their advice in points of theology and law; the promoter fiscal, whose office it is to examine the depositions of the witnesses, to give information of criminals to the inquisitors, and to demand their apprehension and imprisonment; and, finally, when apprehended and admonished, to accuse them; notaries or registers, who write down the injunctions, accusations, and all the pleadings of the causes; the judge and receiver of the confiscated effects; the executor and officials, who apprehend and keep in custody criminals; the attendants or FAMILIARS; the CROSS-*bearers*; and the visitors, who visit all the provinces of the inquisitors, and report to the inquisitor-general and council whatever was proper to be amended. The civil magistrate is entirely excluded from the cognizance of heresy; but the inquisitors require their assistance for the punishment of heretics, in consequence of the sentence which they pronounce; and they are severely threatened with the most grievous punishments, if they neglect their duty. The punishments inflicted by the *inquisition* on heretics are ecclesiastical and civil: the ecclesiastical or canonical are EXCOMMUNICATION, deprivation of ecclesiastical burial, dignities, benefices, and offices. The civil are confiscation of goods, which is inflicted on all who are convicted of heresy, or confess, whether they repent or persist in their heresy, because they are declared to incur the punishment, *ipso jure*, as soon as they fall into heresy; disinheriting the children, insomuch that though they are catholics, they can never inherit the estates of their fathers who died in heresy; infamy, which excludes from all public offices, from bearing witness, making wills, &c. loss of all dominion, natural or civil, as power of parents over children, masters over servants, magistrates and princes over subjects, &c. and the deprivation of all property in every thing they have; imprisonment; bans, which is a kind of sentence of excommunication, by which any person is cast out of the commonwealth, so that he cannot enjoy the public protection, or discharge any public offices, or receive any benefit of law; diffidation, which declares heretics to be enemies of their country and of the empire, so that any person, by his own private authority, may seize, plunder, and kill him, as an enemy and robber, even though he be a clergyman; nor is it lawful for any one to undertake their defence when apprehended; and those advocates who favour and plead for them, are pronounced infamous, and suspended from their office; and finally death, which is that of being burnt alive, in some cases heightened by being gagged with an iron instrument, so that in the midst of their torments they can utter only an inarticulate sound.

It is the constant practice of the *inquisition* to affect, in all their procedures, to inspire as much terror and amazement as possible; every thing is done with the profoundest silence and secrecy, and with the greatest rigour, and pretended impartiality. When a person is seized, all the world abandons him; not the nearest friend dares to speak a word in his defence; that alone would be enough to render them suspected of heresy, and would bring them

them within the claws of the *inquisition*; nay, the greatest robbers are bribed and constrained to accuse one another. The criminals are seized, examined, tried, tortured, and, unless they recant, are even condemned and executed, without ever seeing or knowing their accusers; whence the revengeful have a fair occasion of wreaking their malice on their enemies. By the forms of the *inquisition*, a perfon defamed only for herefy is obliged to make canonical purgation, i. e. to purge himfelf with feven, more or lefs, compurgators; fo that if he fails in one, two, or three, he is accounted guilty: befides, every one, though excluded by other courts, is admitted as a witnefs, a mortal enemy only excepted. The names of the witneffes are not fhewn to the prifoner; nor is any circumftance difcovered, by which he can obtain the knowledge of them. If two unexceptionable witneffes teftify of different facts; yea, fometimes if there be only one, or a mere report, it is thought fufficient for ordering the torture; the evidence of two unexceptionable witneffes, who agree, is fufficient for the conviction and condemnation of any perfon. Thofe that are informed againft are conftrained to become their own accufers; and various arts are ufed to extort a confeffion from them. The advocate allowed them is under the direction of the *inquifitor*, and employed chiefly in order to betray them: moreover, when the crimes cannot be proved againft them, they are only abfolved from profecution, but their crimes and names are recorded againft them. The ufe of torture for difcovering fecret crimes lying concealed in the mind, is a flagrant inftance of injuftice; and perfons are put to the torture upon half full proof of the crime, i. e. fault ering, defamation, one witnefs of his own knowledge, or when the tokens are vehement or violent. Thofe tortures are ufed under a pretence of difcovering the truth, and they are varied and continued with the moft wanton cruelty. After thefe, and many other fhocking proceffes, when the *inquifition* has done with the criminals, and condemned them to death, they are turned over to the fecular arm, with much prayer, and pious intreaty, that their lives may not be touched.

Time is no manner of fecurity in point of herefy; nor does the grave itfelf fhelter the accufed from the purfuits of the *inquifition*; even the deceafed have their trials, and they proceed in all their form and folemnity againft the dead carcafes. The executions are always deferred till the number of the condemned is very great, that the multitude of fufferers may ftrike the deeper horror, and make the fcene more terrible and fhocking. See ACT of *Faith*.

The *inquifition* is very fevere in the Indies. It is true, there muft there be the oaths of feven witneffes to condemn a man; but the depofition of flaves or children are taken. The perfon is tortured till he condemns himfelf; for his accufers are never brought to confront him. Perfons are accufed for the ftendereft expreffion againft the church; or even for a diffefpectful word of the *inquifitor*.

The ftandard of the *inquifition* in Spain is a piece of red damaik, on which is painted a crofs, with an olive-branch on one fide, and a fword on the other; with thefe words of the pfalm, *Exurge, Domine, & judica caufam meam.*

The ftandard of the *inquifition* in Portugal hath their fuppofed founder, Dominic's picture on one fide, and on the other fide the crofs, between an olive-tree and a fword, with this motto, *Juftitia & mifericordia.*

See on the fubject of this article Limborch's Hift. of the *Inquifition*, by Chandler, paffim. Mofheim's Eccl. Hift. vol. iii. p. 113, &c. 8vo.

INQUISITORS, in *Law*, are fheriffs, coroners *fuper vifum corporis*, or the like, who have authority to enquire into certain *cafes, ex officio*.

IN QUO, *Medium in quo*. See MEDIUM.

INROLLMENT, in *Law*, the regiftering, recording, or entering of any lawful act, or inftrument, in the records of chancery; as a recognizance acknowledged, or a ftatute, or a fine levied.

Inrollments are alfo made in the rolls of the exchequer, king's bench, and common pleas; in the huftings at Guildhall, London; and by the clerk of the peace in any county. See REGISTER.

* INROLLMENTS, *clerk of the*. See CLERK.

INSAG, in *Natural Hiftory*, a name given by the people of the Philippine iflands to one of the feveral fpecies of parrots, common in their woods. The *infeg* is a very beautiful bird; its body is of a very bright green, and its head of a fine florid red.

INSANUM *parliamentum*. See PARLIAMENTUM.

INSCHI, or INSCHI *kna*, in the *Materia Medica*, a name given by fome authors to the common ginger.

INSCONCED, in the *Military Art*, denotes that part of an army that have fortified themfelves with a *fconce*, or fmall fort, in order to defend fome paſs, &c. See SCONCE.

INSCRIBED, in *Geometry*.—A figure is faid to be *inſcribed* in another, when all the angles of the figure *inſcribed* touch either the angles, fides, or plains of the other.

INSCRIBED *Hyperbola*, is fuch an one as lies entirely within the angle of its afymptotes; as the conical *hyperbola* is.

See HYPERBOLA and CIRCUMSCRIBING.

INSCRIPTION, a title, or writing, affixed to any thing, to give fome farther knowledge thereof; or to tranſmit fome important truth to poſterity.

Antiquaries are very curious in examining ancient *inſcriptions* found on ſtones, and other monuments of antiquity. Sanchoniathon, contemporary, as it is ſaid, with Gideon, drew moſt of the memoirs whereof his hiſtory is compoſed, from *inſcriptions* which he found in temples, and on columns, both among the Heathens, and the Hebrews.

It appears, indeed, that the ancients engraved upon pillars the moſt valuable pieces of ſciences, as well as the hiſtory of the world. Thoſe mentioned by Herodotus ſhew, that this was the firſt way of inſtructing people, and tranſmitting hiſtories, and ſciences, to poſterity. This is confirmed by Pliny in his Hiſtory, wherein he ſays, that Piſiſtratus engraved, on ſtone pillars, precepts uſeful for huſbandmen. Pliny aſſures us, that the firſt public monuments were made of plates of lead; and that the treaties of confederacy concluded between the Romans and the Jews, were written upon plates of braſs; that, ſays he, the Jews might have ſomething to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in *inſcriptions*, and were extremely fond of being mentioned in them: and hence it is, that we find ſo many in thoſe countries of ancient learning, that large volumes have been compoſed; as the collection of Gruter, &c. Since Gruter's collection, Th. Reinefius has compiled another huge volume of *inſcriptions*. M. Fabretty publiſhed another volume at Rome in 1699, wherein he has corrected abundance of errors which had eſcaped Gruter, Reineſius, and other antiquaries, &c. and added a great number of *inſcriptions* omitted by them.—Since all theſe, Grævius has publiſhed a complete collection of *inſcriptions*, in three volumes in folio. In France is an ACADEMY of *inſcriptions* and medals, the members of which are to meet twice a week, and employ themſelves in the examination of medals, and ancient monuments, and of parts of Greek and Roman literature; and to compoſe a hiſtory of the kings of France from medals.—Since the academy at the time of its inſtitution, or rather reſtauration, to the beginning of this century; but as they are not now wholly employed about medals and *inſcriptions*, they have changed their name for one of a greater latitude, and are called the Academy des Belles Lettres.

INSCRIPTIONS, *Notes, or Abbreviations, uſed in*. See CHARACTER.

INSCRUTABLE, *Unſearchable*, in *Theology*, is uſually underſtood of the ſecrets of Providence, and the judgments of God, which cannot be found out, or into which human reaſon cannot penetrate.

INSECTS, INSECTA, (the word is originally Latin, formed of *in*, and *ſecs, I cut*; the reaſon of which is, that in ſome of this tribe, as ants, the body ſeems to be cut, or divided into two, or becauſe the bodies of many, as worms, caterpillars, &c. are compoſed of divers circles, or rings, which form a ſort of inciſure), in *Natural Hiſtory*, a ſmaller ſort of animals, commonly ſuppoſed to be exſanguinous; and diſtinguiſhed by certain inciſures, cuttings, or indentings, in their bodies.

Their characters are, that their body is covered with a ſort of bony ſubſtance inſtead of ſkin, and their heads are furniſhed with antennæ, called horns.

All *inſects* have ſix or more feet, which are denominated from the various motions they produce, *curſorii*, or running; *ſaltatorii*, or leaping, the thighs being remarkably large; *natatorii*, or ſwimming, which are flat and edged, with hairs: the *muſci* are ſuch feet as have no claws; the foreſeet are enlarged towards their extremities, and each of them is furniſhed with two leſſer claws, acting like a thumb and finger. They reſpire through pores placed on the ſides of their bodies, called *ſtirculæ*: the head has no brain, and is furniſhed neither with ears nor noſtrils. Moſt *inſects* have two eyes, but ſome have more, without eye-brows. The antennæ are generally two, placed in the fore part of the head, and diſtinguiſhed from the tentacula of worms, in being cruſtaceous: they are of various forms, and ſerve to diſtinguiſh the different kinds of *inſects*: the principal diſtinctions are the following; viz. the *ſetaceæ*, which grow gradually taper towards the extremity; the *filiformes*, which are of the ſame thickneſs throughout; the *moniliformes*, which are filiform, conſiſting of a ſeries of round knobs; the *clavatæ*, which gradually increaſe in ſize towards the extremity; the *capitatæ*, which are clavated with the extremity roundiſh; the *ſetiæ*, which

are capitated, with the small head divided longitudinally into three or four parts or laminæ; the *perfoliatæ*, which are capitated with the small head horizontally divided; the *pectinatæ*, so called from their similitude to a comb or feather; *aristatæ*, which have a lateral hair, that is either naked or furnished with leſſer hairs; *brevicornes*, *longicornes*, and *moniliformes*, which are reſpectively ſhorter than the body, longer, and of the ſame length with it. Beſides the antennæ, there are the *palpi* or feelers, reſembling filiform, articulated, moveable antennæ, but ſufficiently diſtinguiſhed from antennæ in being naked, ſhort, and always at the mouth: they are commonly four in number, ſometimes ſix. The mouth is generally placed in the anterior part of the head, ſometimes under the breaſt, and ſometimes drawn out to a rigid point called the *roſtrum* or *probolis*; the maxillæ or jaws are two, ſometimes four or more, placed horizontally; and the inner edge in ſome *inſects* is inſerrated or furniſhed with little teeth. The tongue is in ſome *inſects* taper and ſpiral, in others fleſhy, reſembling a probolis; and tubular, as in the fly. The ſtemmata or crowns are three ſmooth hemiſpheric dots, placed generally on the top of the head. The trunk is ſituated between the head and abdomen, and comprehends the *thorax*, which is the back part of the breaſt, being called denuated when its ſides are armed with points; ſpinoſe, when its ſides are furniſhed with them; and marginated, when its margin is laterally dilated: the *ſcutellum* or eſcutcheon, which is the poſterior part of the thorax, often triangular and divided from the thorax by an intervening ſuture; and the ſternum, which is ſituated on the inferior part of the thorax, ſometimes pointed behind, and ſometimes biſid. The abdomen of *inſects* is the poſterior part of their body, compoſed of a number of annular ſegments, which ſerve occaſionally to lengthen or ſhorten it, and to contain the organs of chylifaction, &c. The ſpiracles are ſmall holes placed ſingly on each ſide of every ſegment of the abdomen through which the *inſect* breathes; and if oil be applied ſo as to ſtop them up, it proves fatal to moſt of them. The anus is the poſterior part of the abdomen, perforated for the evacuation of the excrement and frequently containing the organs of generation. The wings of *inſects*, which are commonly four, and ſometimes two, are membranous and almoſt always undivided; and they are called *plicatiles*, when they are folded at the time the *inſect* is at reſt; *planæ*, when they are incapable of being folded; *erutæ*, which have their ſuperior ſurfaces brought into contact when the *inſect* is at reſt; *patentes*, which remains horizontally extended; *incumbentes*, when they cover horizontally the ſuperior part of the abdomen; *reflexæ*, which are incumbent, with the outer edges declining towards the ſides; *reverſæ*, which are declex, with the edge of the inferior wing projecting from below the anterior part of the ſuperior ones; *dentatæ*, which have the edge ſerrated or ſcooped; *caudatæ*, in which one or more projections in the hinder wings are extended into proceſſes; and *reticulatæ*, when the veſſels of the wings put on the appearance of network. The colours of *inſects* bear different names according to their ſhape; thus there are *puncta* or dots, *macula* or ſpots, *faſciæ* or bands, which frequently run acroſs and ſometimes ſurround the edge of the wings; *ſtriæ* or ſtreaks, which are very ſlender faſciæ; and lineæ or lines, which are longitudinally extended. The *ocellus* is a round ſpot, containing a leſſer ſpot of a different colour in its centre: the ſtigmata are the ſpots or anaſtomoſes in the middle of the wing near the anterior margin; and the ſingle or double kidney-ſhaped ſpot, ſituated in the ſame part of the anterior wings, is alſo diſtinguiſhed by the name of ſtigma. The *elytra* are the upper wings, which are of a hard ſubſtance, in ſome degree reſembling leather, and in moſt *inſects* of a very hard texture, but in others flexible: their upper ſurface is generally convex, their lower one concave; they are extended when the *inſect* flies, and ſhut when it reſts, cloſing together and forming a longitudinal ſuture down the middle of the back. They are of various ſhapes, and called accordingly *abbreviatæ*, when ſhorter than the abdomen; *truncatæ*, when they alſo terminate in a tranſverſe line; *faſtigiatæ*, when in the ſame circumſtance they are of equal length with the abdomen or longer; *ſerratæ*, when the exterior margin towards the apex is notched or ſerrated; *ſpinoſæ*, when their ſurface is covered with ſharp points or prickles; *ſcabræ*, when their ſurface is ſo uneven as to grate againſt the fingers; *ſtriatæ*, when marked with ſlender longitudinal furrows; *ſurcatæ*, when they have elevated longitudinal ſulci or ridges; and *ſulcatæ*, when theſe ridges are concave. When the ſuperior wings are of a middle ſubſtance betwixt leather and membrane they are called *hemielytra*. The *halteres* or poiſers are little heads placed on a ſtalk or peduncle, moſt frequently under a little arched ſcale, and appearing to be nothing more than the rudiments of the hinder wings. The tail in moſt *inſects* is ſimple, capable of being extended, and again drawn back at pleaſure: however, in others it is elongated or lengthened out; briſtle-ſhaped or taper; *triſeta*, compoſed of three briſtles; *furcata*, or forked; *forcipata*, reſembling a forceps; *foliofa*, reſembling a leaf; *teliſera*, when armed with a dart or ſting. The *aculeus* is an inſtrument with which *inſects* wound, and at the ſame time inſtil a poiſon. The ſame difference of ſex exiſts in *inſects* as in other animals, and they appear more diſpoſed to increaſe their ſpecies: many of them, when become perfect, ſeeming to be created for no other purpoſe but to propagate their ſpecies. The difference of ſex is with difficulty diſtinguiſhed in many *inſects*; in ſome, however, the difference is ſo great, that the male and female may be miſtaken for *inſects* of different ſpecies. The colour is different in ſome, and in others the male has wings and the female has none. Beſides the ſexes of male and female, there is a third diſtinction in ſome *inſects* called *neuter*, which have not the diſtinguiſhing parts of either ſex. No hermaphrodites have as yet been diſcovered among *inſects*: there is ſomething very ſingular, however, in the propagation of the aphides: a female APHIS, once impregnated, can produce young, which will continue to produce others without any freſh impregnation, even to the fifth progeny; afterwards a new impregnation muſt take place. The male *inſects* are always ſmaller than the females. See Linnæi Syſtema Naturæ, tom. i. pars ii. p. 533, &c. and Fundamenta Entomologiæ apud Linnæi Amœnitates Academicæ, vol. vii.

Dr. Hill in his hiſtory of animals ſubdivides *inſects* into three general ſeries, each whereof comprehends under it ſeveral claſſes, and thoſe again many diſtinct genera.

The firſt ſeries of *inſects* is called APTERIA; becauſe under it are comprehended all *inſects* of what kind ſoever, having no wings.

Of this ſeries there are two claſſes, the ANARTHRA and PODARIA.

The ſecond ſeries of *inſects* is called PTERARIA, as comprehending all the winged kinds.

Of this ſeries there are likewiſe two orders or ſubdiviſions: 1. The *pteraria diptera*, or *inſects* with two wings. 2. The *pteraria tetroptera*, or thoſe with four wings.

The third and laſt ſeries of *inſects* is called GYMNARTHRIDIA, and comprehends all thoſe *inſects* which have ſoft and naked bodies, furniſhed with limbs.

Linnæus diſtributes *inſects*, the fifth claſs of animals, into ſeven orders, diſtinguiſhed by their wings, viz. *coleoptera*, *hemiptera*, *lepidoptera*, *neuroptera*, *hymenoptera*, *diptera* and *aptera*, including 86 genera, and 2080 ſpecies. *Inſects*, according to Mr. Ray in his Methodus Inſectorum, are either, firſt, *ægrometabola*, ſuch as do not change their form: or, ſecondly, *palingenæſia*, ſuch as do really change their form.

INSECTS *which do not change their form*, are either 1. Apoda, without feet; or, 2. *Podata*, with feet; and of theſe there are ſome kinds that caſt their ſkins, and others that do not.

INSECTS *without feet* are either *terreſtrial*, i. e. land-*inſects*, or *aquatic*.

INSECTS, *terreſtrial*, are either, firſt, ſuch as are produced on the land: as the lumbrici terreſtres, which are either of the larger ſort, and called *dew-worms*; or of a ſmaller ſize: and theſe are ſome red, and others green, with yellow tails, which laſt are commonly called *gilt-tails*. Or, ſecondly, ſuch as are found in the bowels of animals.

To the genus of *terreſtrial inſects*, many natural hiſtorians alſo refer ſnails, whether with or without ſhells.

INSECTS, *aquatic*, without feet, not changing their form, are, either, firſt, of the greater ſort, which have a peculiar way of moving, by firſt fixing their head to the ground, and then drawing up the tail towards it, &c. of theſe, ſome are *teretes*, round and ſmooth: or, ſecondly, of the *leſſer ſort*, which have a different way of crawling, or moving from the former.

There is an *inſect* of a very peculiarly amphibious kind, which Mr. Reaumur has accurately deſcribed in the Memoirs of the Paris Academy. Many animals are aquatic for a part of their lives, and paſs the reſt on dry land; but this ſingular creature always contrives to have its head and tail both in the water, and the intermediate part of its body out. To conceive the manner in which this is effected, we muſt conſider its figure: it is compoſed, like many other, of theſe ſmall animals, of ſeveral rings or joints; it has eleven of theſe between its head and its tail; they are all roundiſh, and very well reſemble a ſtring of beads. The creature is almoſt always in a bending figure repreſenting a ſyphon; its head and tail are always placed near one and another, while the body is elevated and forms an arch above them, the head, the

tail, and the ring joining to the tail, are the parts conſtantly kept in the water; and the nine other rings, or at leaſt ſeven of them, lie upon dry land. The conſtant habitation of the animal is at the edges of ſtanding waters. It conſtantly draws back if more of the body is wetted, and plunges in deeper if leſs than the allotted portion is ſo. The animal is not more than two thirds of an inch long.

Its manner of moving is very particular; for neither the head nor the tail ſeem concerned in it, but the higheſt part or ſixth ring of the body, which in its crooked ſhape makes the ſummit of the arch, is what moves firſt, and draws all the other parts to follow it, the creature continuing in its bended poſture while it moves. It does not move by vermicular progreſſion, as ſome animals do, but has regular feet. Theſe indeed are ſo ſmall as not to be diſtinguiſhable without the aſſiſtance of glaſſes; but when ſeen, they are found to be one of the greateſt ſingularities of the animal. See farther, Mem. Acad. Par. 1714.

INSECTS *not changing form, and having feet*, are either, firſt, *hexapoda*, with ſix feet. Secondly, *octopoda*, with eight feet. Thirdly, *decotetraropoda*, with fourteen feet. Or, fourthly, *polypoda*, with more numerous feet.

Thoſe that have but ſix feet are either *terreſtrial* or *aquatic*.

INSECTS *which undergo a change of their form* are called, *μεταμορφωμενα*, though improperly; ſince, as Swammerdam ſhews, there is no real tranſmutation, but only an explication of the parts of the animal, latent before in miniature, like the plant in the ſeed, and an increaſe of all the parts by proper degrees. In theſe the firſt ſpecies of tranſmutation, or change, is inſtantaneous, there being no ſenſible reſt, or ſtop, between the old and the new form. The *inſects* of this order do not loſe their motion at the time they ſhift the pellicula, at leaſt not to appearance.—This is when the vermiculus, leaving the former ſhape of the nympha, with which it appeared in the egg, and ſubſiſted without food, now beginning to feed, has its members, or parts, viſibly increaſed, and ſtretched out, and takes the form of a new nympha, which is not without motion; and from thence becomes a flying *inſect*.

The ſecond ſpecies of tranſmutation includes ſuch *inſects*, as undergo a double metamorphoſis, or change of ſhape. 1. Into a *chryſalis*, or ſomething analogous to it. 2. Into a flying *inſect*.

Theſe kinds of *inſects*, a while before they change, lie quite ſtill, without feeding, or changing place: and, in reſpect of their wings, are, firſt, *πολυπτερα*, or vaginipennia, as the *ſcarabæi*, beetles. Secondly, *ανοπτερα*, whoſe wings are open and expanded; and the wings of theſe are either farinaceous, as in the *papiliones*, &c. or membranous, as in the *apes*, *muſcæ*, &c. and theſe are either *διπτερα*, with two wings, or *τετραπτερα*, with four wings.

The third ſpecies of tranſmutation is a ſimple change from a vermiculus to a flying *inſect*, but with a ſenſible *ενυπνια*, reſt or ſtop, between one form and the other. This exchange Swammerdam thus deſcribes: "The "vermicule excluded from the egg gets nouriſhment by "little and little from without, and under that firſt "ſkin, or covering, has its membranes increaſed by de-"grees: not ſtripping it, or putting it off, as other ver-"miculi do when they change into nymphæ, but aſſum-"ing the figure of a nympha in it: for a time it is quite "motionleſs, till the ſuperfluous moiſture is evaporated; "and then in a few days, it recovers its motion again, "and caſting off the ſkin, which is, as it were, double, "it becomes a fly." See *Tranſformation* of INSECTS below.

INSECTS, *eyes of*. See EYES *of Flies*.

INSECTS, *generation of*. The world is now generally convinced, that *inſects* are not bred of corruption, but *ex ovo*; though the contrary was believed by the ancients, becauſe of the vaſt numbers that were ſometimes hatched, as it were, at once, and becauſe they could not diſcern the particular manner of their propagation. See GENERATION.

Malpighi, Swammerdam, and Redi, have abundantly diſproved the doctrine of equivocal generation, as well as the chimerical tranſformation of the caterpillar into the butterfly, and other the like metamorphoſes; and have ſhewn, that all the members of the butterfly were originally incloſed under the ſkin or nympha of the caterpillar, as the parts of the plant are in the ſeed.

Inſects take particular care to depoſit their eggs, or ſeed, in ſuch places where they may have a ſufficient incubation, and where the young, when hatched, may have the benefit of proper food till they become able to ſhift for themſelves. Thoſe whoſe food is in the water, lay their eggs in the water; thoſe to whom fleſh is a proper food, in fleſh; and thoſe to whom the fruits or leaves of vegetables are food, are accordingly depoſited, ſome in this fruit, ſome in that tree, and ſome in one plant, and ſome in another; but conſtantly the ſame kind in the ſame tree, or plant. As for others, that require a more conſtant and greater degree of warmth, they are provided by the parent animal with ſome place in or about the body of other animals; ſome in the feathers of birds, ſome in the hide of beaſts, ſome in the ſcales of fiſhes, ſome in the noſe, ſome in the fleſh, nay, ſome in the bowels and inmoſt receſſes of man, and other creatures. And as for others, to whom none of theſe methods are proper, the parents make them neſts by perforation in the earth, in woods, in combs, and the like; carrying in and ſealing up proviſions that ſerve both for the production of their young, and for their food, when produced.

In flies, butterflies, &c. it is obſerved, there is a kind of gluten, by which the female faſtens her eggs to the bearing buds of trees, &c. ſo that the rains cannot waſh them off. Theſe eggs will not be hurt by the greateſt froſt.

Andry, De la Generation de Vers dans le Corps de l'Homme, takes notice, that the ancients were miſtaken in denying that *inſects* did breathe, on the account of their wanting lungs; for modern obſervations convince us that *inſects* have a greater number of lungs than other animals.

The ancients thought, alſo, that *inſects* had no blood, becauſe many of them had no red liquor like our blood; but it is not the colour, but the uſe of that liquor, that is to be regarded.

They believed, alſo, that *inſects* had no hearts; whereas our microſcopes do now diſcover, that when *inſects* have ſeveral lungs, they have alſo ſeveral hearts; and, in particular, it is found, that ſilk-worms have a continued chain of hearts, reaching from the head almoſt to the very extremity of the tail. See HEARTS *of inſects*.

It is this number of hearts and lungs that occaſions thoſe *inſects* to give ſigns of life long after they are divided into ſeveral parts.

Andry obſerves, alſo, that it is wrong to call *inſects* imperfect animals, ſince they want no parts either neceſſary or convenient for their uſe, to render them complete in their kind.—There are ſome who aſſirm, that the earth-worms, and thoſe round-tailed worms which are found in the inteſtines of men and horſes, &c. alſo ſnails and horſe-leeches, are hermaphrodites; but that ſuch worms as become flies, and ſilk-worms, are not ſo; being of no ſex, but only peculiar caſes of real animals, which we ſee, in time, come out with wings.

The moderns have proceeded much farther in the knowledge of *inſects* than the ancients, as having the advantages of the microſcope, which diſtinguiſhes their minute parts, whereof they have publiſhed draughts and deſcriptions. Dr. Hook has publiſhed a Micrography in folio; and Fran. Redi, a phyſician, at Florence, has publiſhed ſeveral figures with new and curious experiments of his own. Sig. Malpighi, Bartholine, and the Philoſophical Tranſactions of London, Paris, and Leipſic, have a great number of fine obſervations and experiments on *inſects*.—Swammerdam has written a general hiſtory of *inſects* in Dutch, and aſſures us, there were, before that, above 400 writers on this ſubject: among others, he ſpeaks well of Wotton, Gefner, Aldrovandus, Mouffet, Harvey, Fabricius ab Aquapendente, Goedart, &c. Hoefnagel, painter to the emperor Rodolphus, has given very good deſigns of above 300 ſpecies; Goedart has deſcribed above 400, and Mr. Albin has given us a new hiſtory of the Engliſh *inſects*, with beautiful figures; and ſince that the late Mr. Willis, and many others, have given hiſtories and figures of many kinds.

The principal authors who have written on *inſects*, or *animalculis*, beſides thoſe already mentioned, are Liſter, Lady Merian, who failed from Holland to Jamaica, in purſuit of the ſtudy of *inſects*, Leewenhoeck, Petiver, Ray, Friſch, Reaumur, Linnæus, who firſt undertook to determine the genera of *inſects*, and aſſign them their proper characters, in the Syſtema Naturæ, and thus reduced this ſcience to a ſyſtematic form, Roeſel, D. Gerr, Admiral Clerk, Ehret, Poda, Scopoli, Sulzer, Paronarius, Seba, Geoffroy, Schaeffer, Harris, Brunnich, Leske, Drury, Sep, and Foſſer.

INSECTS, *tranſformation of*. It is well known that flies are not produced in that form, from the eggs of their parent fly, but undergo a change like that of the butterfly, and the like winged inſects; the egg hatching into a worm; a caſe or CATERPILLAR, called by Linnæus *larva*, the inſect being in this ſtate maſked, or having its true appearance concealed; and this, after performing all the operations of animal life for a certain time, enters into a ſtate of reſt, diſtinguiſhed by the name of chryſalis, or AURELIA, and

more lately by that of *pupa*: and thence is changed into a fly, or the *imago*, as it is called by Linnæus.

Swammerdam, to whom the world is indebted for the firſt true inſight into the wonders of the inſect-world, has evidently proved, that what had before been called by the pompous and myſterious names of changes and *tranſformations* of one animal into another, as of a worm into a fly, and the like, is, in reality, no more than a gradual and natural growth and evolution of the parts, not any metamorphoſis of them; and this growth reſembles very well, when judiciouſly conſidered, not only the increaſe of other animals, but alſo the natural building and increaſe of plants.

The progreſs of theſe changes, as they are called, in *inſects*, is expreſſed by two different terms in their two moſt remarkable ſtates; the words are the *nymphæ* and the *chryſalis*. See AURELIA and NYMPH.

Swammerdam refers the general changes, as they are called, of the inſect-tribe, into four claſſes, one or other of which occurs in that of every known *inſect*, a very few excepted, whoſe progreſſions have not yet been ſufficiently inquired into, to aſcertain their nature. The four general claſſes, or ranks of changes, are diſtinguiſhed by four different ways of production, change, and growth.

The firſt rank, which he expreſſes by the name of nymph-animal, hath a little animal fully formed in the egg, which, after the evaporation of the ſuperfluous moiſture, comes forth perfect, and ſo grows up. Such is the louſe, and the like.

The ſecond claſs is diſtinguiſhed by the name of *nympha-vermiculus*. Theſe have the parts of the future *inſect* imperfectly ſhaped in the egg, and, after hatching, leave the creature to acquire its perfection viſibly by outward food. Of this kind are the graſshopper, the locuſt, the cricket, and many other the like creatures.

The third claſs he diſtinguiſhes by the name of the *nympha-chryſalis, or nympha-aurelia*. Theſe, after hatching, obtain their perfection darkly, and not till after the caſting off the laſt ſkin; ſuch are the butterflies and the like. The ſecond and third claſs agree in this, that not a perfect animal, but a worm, is produced from the egg; and precedes the growing of the perfect parts; yet with this difference, that in the ſecond the little creature grows up manifeſtly and obviouſly to the eye; but in the third all in darkneſs and obſcurity under the ſkin, and, as it were, within the body of the creature.

The fourth claſs is diſtinguiſhed by the phraſe *nympha vermiformes*; and the creatures of this claſs remain always ſhut up in the caſe of the worm or maggot, without any poſſibility of diſcerning the parts, till caſting both ſkins at once, it becomes a perfect and free animal, capable of propagating its ſpecies.

Theſe *inſects* which come forth perfect, and in their own proper form, out of the egg, ſuffer no future changes, but only the caſting off their ſkins; but thoſe which come from under the envelopement of a vermicular coat, do, beſides caſting their ſkins, after a proper time of eating and crawling about in that ſtate, become nymphæ: and all *inſects*, as well thoſe which come out of the egg in the worm ſtate, as thoſe which come forth in their own form, are originally, in the egg, all in the nymph-form; and thoſe which come out of the egg perfect animals, have no other difference in the manner of their productions from the others, but that they have ſuffered in the egg, and out of the way of our inſpection, all thoſe changes which the others do undergo in the chryſalis or nymph-ſtate, in our ſight. The parts of the nymphæ of theſe animals protuberate and expand themſelves by degrees, much in the ſame manner that the buds of flowers of plants do; and the caterpillar is certainly the butterfly itſelf, only covered with a mantle which hides its ſeveral limbs from our eyes till thrown off.

Thus are the general tribes of *inſects* regularly reduced to theſe four claſſes, in regard to the manner of their production. Thoſe particular ſpecies which ſeem not reducible to theſe, or any other rules, or for which further obſervation at leaſt is required, are the glow-worm, the ſcolopendra, the julus, the weavil or curculio, the dung-beetle or pilularius ſcarabæus, the ſmalleſt water-beetle, and the ſcorpion. See theſe under their ſeveral heads. Swam. Hiſt. Inſect.

Though the general courſe of nature is the ſame in this reſpect in flies and butterflies, yet the means and manner of it are different; the BUTTERFLY makes its coat for this *tranſformation*; the fly-worms of many kinds have only a ſhell of their own proper ſkin to undergo this change in.

All the fly-worms of the firſt and ſecond, and many of thoſe of the third claſs, have their caſe thus made only of their own ſkins; the different ſpecies afford indeed ſome varieties in the manner of this, but a general idea of the work may be had from obſerving the worm or maggot of the common fleſh-fly in its ſeveral ſtages.

When this creature has arrived at its full growth, it finds it not convenient any longer to remain among the food it has till then lived upon; it quits it and now goes in ſearch of a place where it may wait for its metamorphoſis. To this purpoſe it creeps into the earth, where it remains two or three days without any change; at the end of this time, inſtead of its pointed figure, its white colour, and ſoft fleſhy ſubſtance, it acquires the figure of an egg, and becomes of a cheſnut colour, or ſomewhat reddiſh, and looks opaque and cruſtaceous; it is in this ſtate perfectly ſtiff, and deſtitute of motion, and the creature ſeems not only to have loſt its form, but wholly to have loſt its life alſo. This however is not the caſe, all that is done is that the creature has abſolutely quitted its ſkin, which is now become hard and of a determinate figure, and is within it completing all its changes.

The manner in which this change of figure is given to the ſkin, is by the creature's drawing its head, and the two or three firſt rings of its body, within the reſt, and by that means making itſelf of this ſhape, ſhort and equally thick at each end. It does this within a few hours after it creeps into the earth, and if taken out after that time is always found of this ſhape, and ſeems to be transformed, only that its ſkin has not yet acquired its brown colour. This however is not at all the caſe, for it can now walk as before, and thruſting out its head and the rings it had drawn in, can again acquire its former figure, which however it loſes afterwards at once, and becomes rigid in a few minutes, and in two or three hours the ſkin it has quitted, and which is now a ſhell, becomes reddiſh, and after a little more time acquires its proper cheſnut colour.

This coat is now no more a ſkin, but a ſhell, and fit to perform all the offices of one; it is no longer connected to the body of the animal, but is become hard, brittle, and rigid. It may, however, yet be diſtinguiſhed, eſpecially by the help of the microſcope, to be made up of a great number of rings, which may be more diſtinctly counted than they could be in the worm.

The *tranſformation* in this ſhell is double before the *inſect* becomes what it is to be finally, a fly like its parent; the firſt *tranſformation* is into an oblong maſs of matter, void of all form, either of the worm it was, or of the fly it is to be; but from this it by degrees aſſumes the figure of the nymph, in which all the lineaments of the future fly are diſtinguiſhable. This *tranſformation* (which is in theſe, and perhaps in all the worms that make a caſe of their own ſkin, prior to their change into the nymph ſtate) may be called the change into the long ball or ſpheroide, or into the ellipſoide. This fly-worm of the blue fly is one of theſe, which with moſt difficulty ſhews this *tranſformation*; but on boiling it at a proper time, and afterwards carefully opening the ſhell, it will always be found in this ſtate.

The time required for theſe ſeveral changes often differs a little, and ſometimes conſiderably; but at a medium it ſtands thus: the worms which have been ſeen to creep into the earth on the 21ſt of April, have come out perfect flies on the 16th of May, and that in a cold ſeaſon for the time of the year.

The changes a multitude of other fly-worms undergo, and their ſhells made of their proper ſkin, are the ſame in all eſſential points with thoſe of the flies firſt mentioned. Some ſpecies have their ſhell more deeply annular, others almoſt entirely ſmooth; ſome have the two ends ſomewhat pointed, and others only one of them ſo; and in ſome this larger inflated end is the anterior, and in others the poſterior. Reaumur's Hiſt. Inſ. vol. iv. p. 288, &c.

INSECTS, *Anatomical uſe of*. The *inſect* world affords us numerous uſes, and thoſe many of them ſuch as no one would at firſt thought imagine, and which no other operation or operators could ſo well effect. In the minutiæ of anatomy, where knives cannot be introduced, the maggot or the ant may be employed with great ſucceſs. Skeletons of fœtuſes have been prepared by burying them in an ant-hill, and that in ſo accurate and perfect a manner, that all who have ſeen them, have admired by what means they could be ſo nicely finiſhed; and the ſecret of the great Ruyſch, by which he cleared away the parenchymatous ſubſtance from his vaſcular preparations, was of this kind. After injecting the veſſels of any part with wax, all that remained to the completing theſe preparations, was the taking off the parenchymatous or fleſhy matter from between and among them. Other anatomiſts of his time did this by the knife, or by maceration in water and other liquors; but it appeared a ſort of magic to them, that his were always not only much ſooner executed, but to a greater nicety and perfection than

than their's ever poſſibly could be. His method was only to put a number of the common fleſh-eating maggots, to the ſubſtance; and theſe regularly eat away all the fleſh, their heads getting into crevices which no inſtrument could reach, and the whole ſubſtance of the inſection remained unhurt, as their ſoft bodies could glide between its niceſt parts without injuring them; and the wax being no food for them, was in no danger of being eroded, even in its ſmalleſt pieces. The ſeveral ſizes of the worms or maggots bred from the eggs of different flies were of great uſe in the perfecting the preparations; for while the larger ſort eat the more fleſhy parts, where the veſſels are large and but few in number, the middle-ſized maggots get into the interſtices of the more vaſcular parts, and the moſt minute of all, which are uſually alſo the moſt numerous, kept about the ſurface, and eat away between and among the capillary veſſels.

The maggots produced from flies are not the only animals fit for this kind of buſineſs. There are ſeveral ſpecies of beetles of the ſmaller kinds, whoſe eggs hatch into a ſix-legged worm, which eats as much and as nicely as the fly-maggots. All theſe may be employed very ſucceſsfully to the preparations of the parts of animals.

Theſe nice anatomiſts are not confined to animal ſubſtances: they often exert their power alſo on vegetables. Many of them feed on the leaves and fruits of plants; and ſome ſpecies of theſe work ſo nicely, that they eat away all the outer membrane and internal parenchymatous ſubſtance of the leaves, ſo as only to leave the net-like plexus of veſſels ſtanding. Yet theſe being unhurt ſhew the true figure of the leaf, and are a ſort of vegetable skeleton, but very poorly imitated by art in the common way, by long macerations in water; this method uſually deſtroying and waſhing away many of the ſmaller veſſels, which the tender mouths of theſe creatures ſpare. If they exert their ſkill often upon leaves in this manner, they do it alſo ſometimes with equal if not greater ſucceſs upon fruits. As in the leaves, thoſe which have the tendereſt parenchyma and the firmeſt ribs, ſucceed beſt; ſo alſo it is in fruits. The leaves of the *ruſcus* or butcher's broom, are often found thus beautifully anatomiſed; and of all fruits, none ſucceeds ſo well as that of the ſtramonium, or thorn apple. Wherever this plant grows in any plenty, the fruit towards autumn, while it is yet full of juice, is attacked by a ſmall worm, which eats away all the parenchyma, and leaves every veſſel ſtanding in its place; and this not only in the outer coat of the fruit, but in the very inner cells of the ſeeds. Theſe veſſels remain exactly in the ſhape of the fruit, and, growing white with the air, exhibit the moſt elegant and beautiful ſkeletons imaginable, while yet ſtanding on the plant. The animal which effects this, is a hexapode worm produced from the egg of a ſmall beetle; and differs very little from ſome of thoſe which ſo elegantly eat away the fleſhy parts from the injected anatomical preparations. Theſe are gregarious animals like ſome ſpecies of the ſmaller caterpillars, and numbers of them are always at work together on the ſame leaf, or fruit, ſo that the ſkeleton is ſoon made. They begin by piercing a number of little holes into the ſubſtance of the leaf, and thence burrow under the integument till they meet one another; and this being done all over the leaf, they leave it, and go to work upon another.

INSECT, *Muſk*, a term uſed by ſome to expreſs the capricorn, or muſk-beetle; but it is too looſe a phraſe for that animal, ſince there are other inſects which ſmell as ſtrongly of that perfume. There is a ſmall kind of bee, very frequent in the paſtures of Lincolnſhire, and ſeveral other parts of England, in April; this frequents the ranunculus and dandelion flowers, and has a very ſtrong and fine ſcent of *muſk*: there is alſo a hexapode worm, which feeds on the *gallium luteum*, or yellow ladies bed-ſtraw, which has the ſame perfumed ſcent in a no leſs degree. Both theſe inſects, and even the capricorn beetle, loſe their perfume when they have been ſome time dead. Phil. Tranſ. N° 76.

INSERTED *eſtamn*. See COLUMN.

INSERTION, a term frequently uſed, in *Anatomy*, to ſignify the implication of one part within another.

Thus we ſay, the *inſertion* of a muſcle.

The *inſertion* of the bones, muſcles, and nerves in the members of an animal, is exceeding artful; the vena cava has its *inſertion* in the right ventricle of the heart.

INSERTION is alſo uſed, in *Agriculture*, for the incloſing a graft within the cleft of a tree. See ENGRAFTING.

INSESSUS, or INSESSIO, in *Medicine*, a kind of half bath, or SEMICUPIUM, uſually prepared with a decoction of ſeveral herbs proper for the lower parts, wherein the patient ſits down to the navel.

It has ſeveral uſes: as the eaſing of pain, ſoftening the parts, diſpelling a flatulent matter, and frequently promoting the menſes.

INSIDIANT *diſeaſe*, a term uſed by ſome authors, to expreſs ſuch diſeaſes as ſhew no evident ſymptom, but remain latent a long time in the body, and are ready to break forth in an unexpected manner, and as it were by ſurpriſe.

INSINUATION denotes a cunning, and covert way of creeping into any perſon's favour.

INSINUATION *of a will*, among *Civilians*, is the firſt production of it, or the leaving it with the regiſter, in order to its probate. See WILL.

INSIPID, *inſipidus*, that which has nothing in it pungent enough to affect the palate, tongue, &c. and to occaſion that ſenſation we call *taſting*.

INSITION, INSITIO, in *Botany*, denotes the ſame with ENGRAFTING; viz. the act of inſerting and uniting a cyon, bud, or the like, in the ſubſtance of the ſtock.

INSOLATION, in *Pharmacy*, a method of preparing certain fruits, drugs, &c. by expoſing them to the heat of the ſun's rays; either to dry, to maturate, or to ſharpen them; as is done in vinegar, figs, &c.

The word comes from the Latin verb *inſolare*, which is uſed by Pliny and Columella; and ſignifies *to expoſe to the ſun*.

INSOLVENT, a term applied to ſuch perſons as have not wherewithal to pay their juſt debts.

A perſon dying, and not leaving eſtate ſufficient to diſcharge theſe, is ſaid to die *inſolvent*.

INSPECTOR, a perſon to whom the care and conduct of any work is committed.

INSPECTORS, in the *Roman law*, were ſuch perſons as examined the quality and value of lands and effects, in order to the adjuſting or proportioning taxes and impoſitions to every man's eſtate.

The Jews alſo have an officer, in their ſynagogue, whom they call *inſpector*, חזן, *chazan*. His buſineſs conſiſts principally in *inſpecting*, or overlooking the prayers and leſſons, in preparing and ſhewing them to the reader, and in ſtanding by him to ſee he reads right; and, if he makes miſtakes, he is to correct him.

INSPICIENDO *writs*. See VENTRE.

INSPIRATION, among *Divines*, &c. implies the conveying of certain extraordinary and ſupernatural notices, or motions, into the ſoul: or, it denotes any ſupernatural influence of God upon the mind of a rational creature, whereby he is formed to any degree of intellectual improvements, to which he could not, or would not in fact have attained in his preſent circumſtances in a natural way.

Thus the prophets are ſaid to have ſpoken by divine *inſpiration*.

Some authors reduce the *inſpiration* of the ſacred writers to a particular care of Providence, which prevented any thing they had ſaid from failing, or coming to nought; maintaining that they never were really *inſpired*, either with knowledge or expreſſion.

According to M. Simon, *inſpiration* is no more than a direction of the Holy Spirit, which never permitted the ſacred writers to be miſtaken.

It is a common opinion, that the *inſpiration* of the Holy Spirit regards only the matter, not the ſtyle, or words; and this ſeems to fall in with M. Simon's doctrine of direction.

Theological writers have enumerated ſeveral kinds of *inſpiration*: ſuch as the *inſpiration* of ſuperintendency, in which God does ſo influence and direct the mind of any perſon, as to keep him more ſecure from error in ſome various and complex diſcourſe, than he would have been merely by the uſe of his natural faculties; plenary ſuperintendent *inſpiration*, which excludes any miſture of error at all from the performance ſo ſuperintended; *inſpiration* of elevation, where the faculties act in a regular, and, as it ſeems, in a common manner, yet are raiſed to an extraordinary degree, ſo that the compoſure ſhall, upon the whole, have more of the true ſublime, or pathetic, than natural genius could have given; and *inſpiration* of ſuggeſtion, when the uſe of the faculties is ſuperſeded, and God does, as it were, ſpeak directly to the mind, making ſuch diſcoveries to it as it could not otherwiſe have obtained, and dictating the very words in which ſuch diſcoveries are to be communicated, if they are deſigned as a meſſage to others.

It is generally allowed that the New Teſtament was written by a ſuperintendent *inſpiration*; for without this the diſcourſes and doctrines of Chriſt could not have been faithfully recorded by the evangeliſts and apoſtles; nor could they have aſſumed the authority of ſpeaking the words of Chriſt, and evinced this authority by the actual exerciſe of miraculous powers: and beſides, the ſacred writings bear many obvious internal marks of their divine original, in the excellence of their doctrines, the ſpirituality and elevation of their deſign, the majeſty and ſimplicity of their ſtyle, the agreement of their various parts, and their efficacy on mankind; to which may be added, that there has been in the Chriſtian church, from its earlieſt

lieft ages, a conſtant tradition, that the ſacred books were written by the extraordinary aſſiſtance of the ſpirit, which muſt at leaſt amount to ſuperintendent *inſpiration*. But it has been controverted whether this *inſpiration* extended to every minute circumſtance in their writings. ſo as to be in the moſt abſolute ſenſe plenary. Jerom, Grotius, Eraſmus, Epiſcopius, and many others, maintain that it was not; and if we allow, it is ſaid, that there were ſome errors in the New Teſtament, as it came from the hands of the apoſtles, there may be great danger of ſubverting the main purpoſe and deſign of it; ſince there will be endleſs room to debate the importance both of facts and doctrines.

Among the Heathens, the prieſts and prieſteſſes were ſaid to be divinely *inſpired*, when they gave oracles.

The poets, alſo, laid claim to it; and, to this end, they always invoked Apollo and the Muſes, at the beginning of any great work.

INSPIRATION, in *Phyſic*, is underſtood of that action of the breaſt, by which the air is admitted into the lungs.

In which ſenſe, *inſpiration* is a branch of reſpiration; and ſtands oppoſed to *expiration*.

This admiſſion of the air depends immediately on its ſpring, or elaſticity, at the time when the cavity of the breaſt is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards: ſo that the air does not enter the lungs, becauſe they are dilated; but thoſe dilate, becauſe the air enters within them. Nor is it the dilatation of the breaſt, which draws in the air, as is commonly thought; though this is a condition abſolutely neceſſary to *inſpiration*; but there is an actual intruſion of the air into the lungs.

INSPISSATING, in *Pharmacy*, an operation whereby a liquor is brought to a thicker conſiſtence, by evaporating the thinner parts.

Thus, juices, as that of liquorice, are *inſpiſſated*.

INSTALLMENT, a ſettling or inſtating, a perſon in a dignity.

The word is derived from the Latin *in*, and *ſtallum*, a term uſed for a ſeat in church, in the choir, or a ſeat or bench in a court of juſtice, &c. though Voſſius is of opinion, the word is of German origin.

Inſtallment is chiefly uſed for the induction of a dean, prebendary, or other eccleſiaſtical dignitary, into the poſſeſſion of his ſtall, or proper ſeat, in the cathedral church to which he belongs.

This is ſometimes alſo called *inſtallation*.

Inſtallment is likewiſe uſed for the ceremony, whereby the knights of the GARTER are placed in their rank, in the chapel of St. George, at Windſor; and on many other like occaſions.

INSTANT, ſuch a part of duration, wherein we perceive no ſucceſſion; or it is that which takes up the time of only one idea in our minds.

It is a maxim, in *Mechanics*, that no natural effect can be produced in an *inſtant*.—Hence may appear the reaſon, why a burthen ſeems lighter to a perſon, the faſter he carries it; and why, the faſter a perſon ſlides, or ſcates, on the ice, the leſs liable is the ice to break.

The ſchoolmen diſtinguiſh three kinds of *inſtants*; a *temporary*, a *natural*, and a *rational inſtant*.

INSTANT, *temporary* is a part of time immediately preceding another: thus the laſt *inſtant* of a day, precedes immediately and really the firſt *inſtant* of the following day.

INSTANT, *natural*, is what we otherwiſe call a *priority of nature*, which obtains in things that are ſubordinated in acting: as, firſt and ſecond cauſes; or cauſes and their effects: for the nature of things requires, that if there be a ſecond cauſe, there muſt be a firſt; and that there muſt be a cauſe, if there be an effect.

INSTANT, *rational*, is not any real *inſtant*, but a point which the underſtanding conceives to have been before ſome other *inſtant*, founded on the nature of the things which occaſions it to be conceived. For inſtance; as God has made ſeveral things voluntarily, which he could otherwiſe have let alone; there is a reaſonable foundation to conceive God, ſuch as he is in himſelf, before he had made any of thoſe voluntary determinations: but as there was no real *inſtant* when God had not formed any determination, this *inſtant* is called a *rational inſtant*, by way of oppoſition to an *inſtant* of time.

INSTANTANEOUS *action*. See ACTION.

INSTAURATION, the re-eſtabliſhment, or reſtauration, of a religion, a church, or the like, to its former ſtate.

The word is by ſome derived from the old Latin, *inſtaurum*, which ſignified the ſtock of things neceſſary for the tilling and managing of grounds; as cattle, tools, harneſs, &c. The word *inſtaurum* is only of the middle age; but *inſtauratio* is of much greater antiquity, and by ſome is derived from *inſtar*, *like*; as importing a thing's being brought to its former likeneſs, or appearance.

INSTEP, in the *Manege*, is that part of the hinder leg of a horſe, that correſponds to the ſhank in the fore-leg, extending from the ham to the paſtern joint.

INSTINCT, a natural diſpoſition, or ſagacity wherewith animals are endued; and by virtue whereof they are enabled to provide for themſelves, and know what is good for them, and are determined to preſerve and propagate their ſpecies.

Inſtinct in brutes, bears ſome analogy to reaſon in men. There have been many ſyſtems adopted to explain the principles which produce and direct the ſpontaneous actions of brute animals.

Many of the ancient philoſophers aſcribed to brutes an underſtanding, differing only in degree from that of man, and attributed their inferiority to the want of proper and ſufficient bodily organs. This ſyſtem has been lately very ſtrenuouſly ſupported by M. Helvetius, de l'Eſprit, tom. i. p. 2. &c. Among the moderns, the learned Cudworth endeavoured to explain the *inſtinct* of animals, by means of a certain PLASTIC *nature*. Des Cartes thought that all the actions of brute animals might be explained by the ſimple laws of mechaniſm, and conſiders them as machines totally devoid of life and ſentiment, but ſo curiouſly conſtructed by the Creator, that the mere impreſſions of light, ſound, and other external agents, on their organs, produced a ſeries of motions in them, and cauſed them to execute thoſe various operations, which had before been aſcribed to an internal principle of life and ſpontaneity. But the actions and manners of animals, which are totally incompatible with the mere principles and laws of mechaniſm, evince the abſurdity of this opinion. M. Buffon adopts the opinion of Des Cartes in part, but grants them life, and the faculty of diſtinguiſhing between pleaſure and pain, together with a ſtrong inclination to the former, and averſion from the latter. By theſe inclinations and averſions he undertakes to account for all, even the moſt ſtriking operations of animals; affirming, that, in conſequence of impreſſions made on the brain, by means of the ſenſitive organs, and by the re-action of the brain and nerves on the muſcles, theſe machines acquire a motion conformable to the nature of the animal, and of the impreſſions of the different objects which act upon their organs, and excite deſire or averſion. See BRUTES.

The *pre-eſtabliſhed* HARMONY of Leibnitz has alſo been applied to explain the actions of brute animals. Others have conſidered the actions of animals as produced by the conſtant and immediate influence of the divine energy, directing all their inclinations and motions: ſuch appears to have been the opinion, however unphiloſophical it muſt appear, of Mr. Addiſon, in the ſecond volume of the Spectator. The late ingenious Hermann Samuel Reimar, profeſſor of philoſophy at Hamburgh, has enumerated and expoſed theſe and other opinions, with regard to the *inſtinct* of animals, in his Obſervations Phyſiques, &c. publiſhed in two vols. 12mo. at Amſterdam and *Paris*, 1770: and, defining *inſtinct*, in the moſt comprehenſive ſenſe of the word, to be every natural inclination, accompanied with a power, in animals, to perform certain actions, divides *inſtincts* into three heads. The firſt, which he calls *mechanical inſtincts*, belong to the body, conſidered as an organized ſubſtance, and are exerciſed blindly and independently of the will of the animal. Such are thoſe which produce the motion of the heart and lungs, the contraction and dilatation of the pupil, digeſtion, &c. This claſs of *inſtincts* is poſſeſſed in common both by men and brutes, and in ſome meaſure even by vegetables. The ſecond claſs comprehends thoſe which he terms *repreſentative inſtincts*, which conſiſt partly in the power of perceiving external objects by their preſent impreſſion on the ſenſes, and partly in the faculty of rendering the ideas of theſe objects preſent to the mind by the powers of imagination, or of memory, in a lax ſenſe of the word. Theſe are common to men and other animals, excepting that brutes poſſeſs only the faculty of imagination in common with us, and not that of memory, in the ſtrict and proper ſenſe of the word. Indeed this author endeavours to prove, that the knowlege of brutes does not merely differ in degree from that of man, but that it is of a kind entirely different from it; and that they are incapable both of memory and reaſoning: the faculty of imagination ſerving to give them a confuſed idea of events that are paſt, by the view, or other impreſſions of objects that are preſent. The third and principal claſs of *inſtincts* is that which comprehends all thoſe which M. Reimar calls *ſpontaneous*. This

ſpecies of *inſtinct* is not attended with any power of *reflection*, determining the animal to decide freely between two different modes of action preſent to his imagination; nor is it merely corporeal or mechanical. It is put into action by the natural and primitive principle of ſelf-love, implanted in all animated beings; or by a love of pleaſure and averſion to pain, producing a voluntary inclination to perform certain actions which tend to their well being and preſervation. To the performance of theſe actions they are particularly prompted by their preſent ſenſations, by imagination ſupplying the place of memory, and by other cauſes. The wonderful effects produced by theſe inſtinctive appetites, are farther to be attributed to the exquiſite mechaniſm in their bodily conformation, particularly in the ſtructure of the various organs with which they execute their operations, and to the ſuperior perfection and acuteneſs of their external ſenſes, by which they are quickly and diſtinctly informed of thoſe qualities of objects which moſt materially concern them. In order to account for the more curious and ſurpriſing operations of brute animals, M. Reimar adds two other principles, viz. 1ſt. an internal diſtinct perception of the preciſe power and proper uſe of their various bodily organs, together with an innate knowledge of the qualities of thoſe objects around them in which they are intereſted; and, 2dly, certain innate and determinate powers and inclinations, impreſſed by the Author of Nature, *a priori*, on the ſoul itſelf; by which they are arbitrarily, and without their own knowledge or conſciouſneſs, directed and irreſiſtibly impelled to the performance of theſe various operations which they execute with ſuch unremitting induſtry and art. Theſe determinate forces, which conſtitute the principal part of M. Reimar's ſyſtem, are no where ſo viſible and diſtinguiſhable as in that numerous ſet of *inſtincts* which he claſſes under the title of the *induſtrious inſtincts* of animals. For a farther account of this ſyſtem we muſt refer to the work itſelf, or to an abſtract of it, with ſeveral of the author's illuſtrations, in the Monthly Review, vol. xlv. p. 533, &c.

INSITA, a word uſed by the chirurgical writers, for a fillet or other bandage of that kind; and by medical writers, for that ſort of flat worms bred in the inteſtines, called by many the tape-worm, or flat worm.

INSTITUTES, INSTITUTA, in the *Civil Law*, a book, containing the elements, or principles of the Roman law; and which conſtitutes the laſt part of the *corpus juris civilis*.

The *Inſtitutes* are a compendium, or ſummary of the whole body of civil law, in four books, compoſed by Trebonianus, Theophilus, and Dorotheus, by order of the emperor Juſtinian, for the uſe of young ſtudents; who, having the firſt elements of the whole profeſſion in this little treatiſe, might the ſooner gain a competent knowledge of it, without being diſcouraged by the bulk of the other books. See CIVIL *Law*.

INSTITUTES likewiſe denote a ſyſtem of laws or rules, in any ſcience.

INSTITUTION, in a general ſenſe, the act of ordaining, founding, or eſtabliſhing, any thing.

Thus we ſay Moſes *inſtituted* the ceremonies of the old law; Jeſus Chriſt *inſtituted* the ſacraments of the new.

INSTITUTION, in the *Canon* and *Common Law*, is the act of the biſhop, or of one commiſſioned by him, whereby a clerk is inveſted with the ſpiritualities of a rectory, or vicarage. See PRESENTATION.

The clerk kneels down before the biſhop, whilſt he pronounces theſe words of *inſtitution* (*Inſtitio te rectorem eccleſiæ de A. B. cum cura animarum, & accipe curam tuam & onus*); and the clerk holds the written inſtrument, with the epiſcopal ſeal annexed, in his hand, during the ceremony.

Before the clerk is inſtituted, he muſt ſubſcribe the thirty-nine articles of religion, in the preſence of the ordinary, or his ſubſtitute; and this ſubſcription muſt be without reſerve, exception, or qualification; elſe his *inſtitution* is, *ipſo facto*, void and null, and the church ſtill vacant. 13 Eliz. c. 12.—At the ſame time the ordinary requires the clerk to ſubſcribe the other two articles mentioned in the 36th canon about the king's ſupremacy, and the lawfulneſs and uſe of the liturgy: the clerk muſt alſo, before *inſtitution*, ſubſcribe to that part of the declaration enjoined by the act of uniformity, 14 Car. II. c. 24. viz. *I will conform to the Liturgy of England, as by law eſtabliſhed.*—Before *inſtitution*, he muſt alſo take the oaths mentioned in the firſt ſtatute of William and Mary, c. 8. inſtead of the former oaths of allegiance and ſupremacy, required by ſtat. 1 Eliz. and then he muſt take the oath againſt ſimony, enjoined by the 40th canon, and the oath of canonical obedience; and if it is a vicarage, the oath of perſonal reſidence: and he is to have certificates given him of his ſubſcribing the declaration contained in the act of uniformity, in Engliſh, in a diſtinct inſtrument, under the hand and ſeal of the biſhop; and of his other ſubſcriptions and oaths, in Latin.

The clerk ought by all means to have witneſſes of his *inſtitution*, his taking the oaths, making ſubſcriptions, &c. and therefore he ſhould deſire ſome preſent to write their names on the back of his inſtruments, and make memorandums who they are, and where they live.

The church, by *inſtitution*, is full againſt all perſons but the king; and the clerk by it may enter into the glebe, and take the tythes; but he cannot let or grant them, nor ſue for them, if they be refuſed to be paid, till he be inducted.

After *inſtitution*, the clerk is to receive a written mandate from the ordinary to the archdeacon, or other proper perſon, in order to his induction; without which he has not a full right to his temporalities, unleſs the benefice be a donative. See INDUCTION.

INSTITUTIONS, in *Literary Matters*, denote a ſyſtem of the elements, or rules, of any art or ſcience. Such are *inſtitutions* of medicine, *inſtitutions* of rhetoric, &c.

INSTITUTORES, in *Botany*, that ſet of authors in this ſcience who have laid down certain ſettled rules, axioms, and inſtitutions in it.

INSTRUCTIVE *column*. See COLUMN.

INSTRUMENT denotes a thing which is ſubſervient to a CAUSE for producing its EFFECT.

A common caſe of mathematical *inſtruments* contains ſeveral compaſſes, a ſector, ſcale, drawing pen, and protractor. A caſe of ſurgeon's *inſtruments* for the pocket contains different ſized lancets, ſciſſars of ſeveral kinds, plain and toothed forceps, ſtrait and crooked inciſion-knives, a ſpatula, probes, needles, &c. Aſtronomical *inſtruments*, are the TELESCOPE, QUADRANT, &c. Chemical *inſtruments*, ſee LABORATORY.

INSTRUMENTS *of ſacrifice*, in the *devique Architecture*, are ornaments, as vaſes, pateræ, candleſticks, knives, &c. wherewith the victims were killed, &c. inſtances of which we ſee in a Corinthian frieze in the remains of a temple behind the Capitol at Rome, &c.

INSTRUMENT is alſo uſed, in *Law*, to ſignify ſome public ACT, or authentic DEED, by means whereof any truth is made apparent, or any right or title eſtabliſhed, in a court of juſtice.

INSTRUMENT, *wind*. See WIND.

INTRUMENTAL *arithmetic*. See ARITHMETIC.

INSTRUMENTAL *cauſe*. See CAUSE.

INSTRUMENTUM *ſynodale*. See SYNODALE.

INSUFFLATIO, a term uſed by ſome writers in medicine, to expreſs the blowing into any part, in order to convey the fumes of medicines into it.

INSULATE, or INSULATED, a term applied to a column, or other edifice, which ſtands alone, or free and detached from any contiguous wall, &c. like an iſland in the ſea; whence the denomination is apparently derived.

INSULATED, in *Electricity*, is a term applied to bodies that are ſupported by ELECTRICS or non-CONDUCTORS; ſo that their communication with the earth, by conducting ſubſtances, is interrupted.

INSULT, in *Law*. See ASSAULT.

INSULT, a military term uſed for the attack of any poſt with open force; without the apparatus of trenches, ſaps, or any regular approaches. See ASSAULT.

INSULTUS, a word uſed by the writers in medicine, to ſignify the acceſs of the paroxyſm in intermittent diſeaſes; or, ſometimes the firſt invaſion of a diſeaſe.

INSUPER, a word uſed by the auditors of the Exchequer. In their accompts they ſay, ſo much remains *inſuper* to ſuch an accomptant; that is, ſo much remains due on his accompt.

INSURANCE, or ASSURANCE, in *Law*, and *Commerce*, a contract or agreement whereby one or more perſons, called inſurers, &c. oblige themſelves to anſwer for the loſs of a ſhip, houſe, goods, &c. ſpecified in the policy of *aſſurance* ſubſcribed by them, in conſideration of a premium, of a ſtipulated ſum per cent. paid by the proprietors of the things inſured.

Suetonius conjectures, that the emperor Claudius was the firſt contriver of *inſurances* on ſhips and merchandize. The firſt inſtance recorded in more modern hiſtory of this practice, is in the year 1560, on occaſion of the vaſt woollen commerce between England and the Netherlands, though it was probably in uſe before this time, and is ſaid to have been introduced by the Jews in 1182: and it is treated of in the Sea-laws of Oleron, as early as the year 1194. The firſt Engliſh ſtatute relating to it is the 43d Eliz. c. 12. It is ſuppoſed to have been introduced into England, and ſoon after into Antwerp, by ſome Italian ſettlers from Lombardy. The merchants at this time met in a place, where Lombard-ſtreet now is, called the Pawn-houſe, or Lombard, where they iſſued policies of *inſurance*; to which the ſubſequent practice referred.

Insurances are of various kinds, as on ships or parts of ships, on merchandize singly, and on ships and goods jointly: and these are again branched out to run either for a time ſtipulated, or to one ſingle port, or out and home, with liberty to touch at the different places mentioned in the policy. *Insurances* may likewiſe be made on goods ſent by land, or by boys, &c. on rivers; and this is frequently done, more eſpecially on jewels, and other things of great value. They may likewiſe be made on ſhips and goods, loſt or not loſt, which is commonly done when a ſhip has been long miſſing; and thoſe words being inſerted in the policy, oblige the under-writers to pay, though the ſhip was loſt at the time of making ſuch *inſurance*, except the aſſured had then certain knowledge of the ſhip's being wrecked; in which caſe the ſubſcription ſhall not oblige, as this is accounted a mere fraud. So likewiſe if a perſon get more inſured than the ſhip is worth, with a villainous deſign to deſtroy her, this fraudulent act will not oblige the inſurers, but expoſe the proprietors to ſuffer death for their knavery. If a ſhip is inſured from the port of London to any foreign port, and before ſhe breaks ground is burnt, the inſurers are not liable; unleſs the words of the *inſurance* are, at and from the port of London; but if ſhe has once broke ground, and after being driven back, takes fire, the inſurers are anſwerable. An *inſurance* made on prohibited goods is not binding, unleſs they were not prohibited till after the *inſurance* was made. Where the policy expreſsly mentions that the ſhip is to depart with convoy, it is intended that ſhe ſhall, if poſſible, keep with the convoy during the voyage, and if ſhe depart willfully from the convoy, it is a fraud; but if having departed with convoy, ſhe by ſtreſs of weather loſes the convoy, and is taken, the inſurers are liable. If there be thieves on board among themſelves, the maſter of the ſhip is to anſwer for that, and not the inſurers; for though the words of the policy inſure againſt loſſes by thieves, yet aſſailing thieves are only here intended. An *inſurance* made in a foreign country, may be ſued in England by the common law, if the inſurers come here. Where the policy is againſt reſtraint of princes, that does not extend to a navigation carried on againſt the law of nations, or where there ſhall be a ſeizure for not paying of cuſtoms, or the like. If goods be inſured as the goods of an ally, when they are the goods of an enemy, it is a fraud, and the *inſurance* not good. If a man pays money on a policy of *inſurance*, ſuppoſing a loſs where there was none, this ſhall be money received for the uſe of the inſurer, for which he may maintain an action. Damages happening to goods in their own nature periſhable, are not to be borne by the inſurer. A ſuppreſſion of the truth, or a falſe allegation, is ſufficient to diſcharge the policy; for it is a general rule, that the inſured ought to inform the inſurer of all material circumſtances that were come to his knowledge at the time of making the policy, in order that the contract may be fairly adjuſted; which being a contract upon chance, cannot be done, if one party knows more than the other; for equality in contracts, by the law-merchant, is eſſential; but a proof of an intention to make a deviation, will not avoid the policy before the deviation is actually made.

By an act made in 19 Geo. II. c. 37. it is determined, that after the firſt day of Auguſt, 1746, no aſſurance ſhall be made on ſhips or lading by way of gaming or wagering, or without benefit of ſalvage to the inſurer: that it ſhall not be lawful to make re-aſſurance, unleſs the aſſurer ſhall become inſolvent, become a bankrupt, or die; in which caſes ſuch aſſurer, or his executors, &c. may make re-aſſurance to the amount of the ſum before aſſured, provided it be expreſſed in the policy to be a re-aſſurance. That all ſums of money lent on bottomry or at reſpondentia, upon any ſhips belonging to his majeſty's ſubjects, bound to and from the Eaſt Indies, ſhall be lent only on the ſhip or merchandize, laden, or to be laden, on board ſuch ſhip, and ſhall be ſo expreſſed in the condition of the bond; and the benefit of ſalvage ſhall be allowed to the lender, his agent or aſſigns, who alone ſhall have a right to make aſſurance on the money ſo lent; and no borrower of money on bottomry, &c. ſhall recover more on any aſſurance than the value of his intereſt in the ſhip or merchandize, excluſively of the money ſo borrowed; and in caſe it ſhall appear, that the value of his ſhare in the ſhip and merchandize does not amount to the full ſum borrowed, ſuch borrower ſhall be reſponſible to the lender for ſo much of the money borrowed, as he hath not laid out on the ſhip or merchandize, with lawful intereſt for the ſame, together with the inſurance and all other charges, to the proportion which the money not laid out ſhall bear to the whole money lent, notwithſtanding the ſhip and merchandize be totally loſt.

Whenever advice is received of the loſs of a ſhip or goods inſured, application is to be made to the inſurers, and the vouchers produced; and if they are ſatisfied they will pay the money; but if they have cauſe to ſcruple the doing it, the inſured muſt ſtay till the inſurers can obtain a more ſatisfactory account; but if nothing be heard of the ſhip in any reaſonable time, the inſurers will be obliged to pay the money agreed upon.

The policies made of *inſurances* are to be ſtamped within three days after the ſhip is inſured, on the penalty of paying 100 l. The principal offices for the *inſurance* of ſhips and merchandize in London, are the Royal-exchange *Aſſurance*, and the London *Aſſurance*, both of which are eſtabliſhed by act of parliament, 6 Geo. I. c. 18. anno 1720. Theſe offices alſo inſure houſes and other buildings, goods, wares, and merchandize, from loſs or damage by fire; and they alſo inſure lives.

The Royal-exchange *Inſurance*, on a brick or ſtone building, inſures any ſum not exceeding 200 l. at 5 s. per ann. and any larger ſum not exceeding 1000 l. after the rate of 2 s. 6 d. per cent. per ann. Above 1000 l. and not exceeding 2000 l. at 3 s. per cent. Above 2000 l. and not exceeding 3000 l. at 4 s. per cent. On goods and merchandize, the property of the aſſured, within any brick or ſtone building, or on the goods and building together, this office inſures any ſum not exceeding 300 l. for 7 s. 6 d. per ann. and larger ſums after the rates above mentioned: but timber or plaſter-buildings, or goods or merchandize therein pay 8 s. per ann. for 200 l. and after the rate of 4 s. per cent. for any greater ſum not exceeding 1000 l. and 5 s. per cent. for all *inſurances* above 1000 l. and not exceeding 2000 l. On a timber or plaſter building with goods and merchandize together, any ſum not exceeding 300 l. may be inſured for 12 s. per ann. and larger ſums at the above rates. The goods belonging to hazardous trades, as diſtillers, chemiſts, apothecaries, colour-men, tallow-chandlers, oil-men, innholders, &c. depoſited in brick houſes, pay 8 s. per ann. for inſuring 200 l. and after the rate of 4 s. per cent. for any greater ſum not exceeding 1000 l. and above 1000 l. and not exceeding 2000 l. 5 s. per cent. but when the houſes and goods are put together, the price of *inſurance* is 4 s. per cent. per ann. without any other charge except the policies.

The London *Inſurance* has the following annual premiums:

Sums aſſured.	Common inſurances.	Hazardous inſurances.	Double hazardous inſurances.
Any ſum.			
Not exceeding 200 l.	4 s. per annum.	6 s. per annum.	10 s. per annum.
From 200 l. to 1000 l.	2 s. per cent. per ann.	3 s. per cent. per ann.	5 s. per cent. per ann.
From 1000 l. to 2000 l.	2 s. 6 d. per cent.	4 s. per cent.	7 s. 6 d. per cent.
From 2000 l. to 3000 l.	4 s. per cent.	6 s. per cent.	7 s. 6 d. per cent.

The Hand-in-hand office, erected in 1696, and enrolled in chancery in 1698, inſures for ſeven years at 10 s. depoſit, and 2 s. premium per cent. on brick and ſtone, and double that ſum for timber-houſes, the ſum not exceeding 1500 l. And for any ſum from 1500 l. to 2000 l. 4 s. per cent. on brick or ſtone, and double on timber houſes, for any term of years not exceeding ſeven. But a ſum exceeding 2000 l. is not to be inſured on any building, without the approbation of a general court; and the office inſures only three fourths of the value of each houſe. To this office belong thirty firemen.

The Sun-fire-office, eſtabliſhed in 1710, beſides 7 s. 6d. for the policy and mark, has the following annual premiums:

Sums inſured.	Common inſurances.	Hazardous inſurances.	Double hazardous inſurances.
Any ſum			
Not exceeding 200 l.	4 s. per annum.	6 s. per annum.	10 s. per annum.
From 200 l. to 1000 l.	2 s. per cent. per ann.	3 s. per cent. per ann.	5 s. per cent. per ann.
From 1000 l. to 2000 l.	2 s. 6 d. per cent.	4 s. per cent.	7 s. 6 d. per cent.
From 2000 l. to 3000 l.	3 s. 6 d. per cent.	5 s. per cent.	7 s. 6 d. per cent.

The common *insurances* comprehend all brick or ſtone buildings not occupied by hazardous trades or goods. The hazardous *insurances* are on timber-buildings, and goods and merchandizes in them called hazardous. The double hazardous are thatched timber or plaſter buildings, wherein hazardous good or trades are kept or carried on. The hazardous trades and goods are apothecaries, chemiſts, bakers, ſhip and tallow-chandlers, ſtable-keepers, inn-holders, and malt-houſes; hemp, flax, tallow, pitch, tar, turpentine, hay, ſtraw, fodder of all ſorts, and corn unthraſhed. To this office belong thirty fire-men, and twenty porters.

The Friendly Society *Inſurance*, or Union fire-office, erected in 1714, and enrolled in chancery in 1715, is formed on the ſame model as that of the Hand-in-hand fire-office, excepting that inſtead of houſes this office only inſures goods and merchandizes at the following rates:

Beſides the parliamentary ſtamp-duties, and the charge of policy and mark, which is 9s. 6d. for every 100l. inſured on goods incloſed in brick or ſtone, 10s. depoſit, and 2s. premium; if half hazardous, 2s to ſituation and kind of goods, 15s. depoſit, and 3s. premium: if hazardous, 20s. depoſit, and 4s. premium: if hazardous and half hazardous, 25s. depoſit, and 5s. premium; if hazardous and hazardous, 30s. depoſit, and 6s. premium. For every 100l. inſured on goods incloſed in part brick and part timber, 12s. 6d. depoſit, and 2s 6d premium: if half hazardous, 18s. 9d. depoſit, and 3s. 9d. premium: if hazardous, 25s. depoſit, and 5s. premium: if hazardous and half hazardous, 1l. 11s. 3d. depoſit, and 6s. 3d. premium: if hazardous and hazardous, 1l. 17s. 6d. depoſit, and 7s. 6d. premium. For every 100l. inſured on goods incloſed in timber, 15s. depoſit, and 3s. premium: if half hazardous, 1l. 2s. 6d. depoſit, and 4s. 6d. premium: if hazardous 30s. depoſit, and 6s. premium: if hazardous and half hazardous, 1l. 17s. 6d. depoſit, and 7s. 6d. premium: if hazardous and hazardous, 2l. 5s. depoſit, and 9s. premium. For every ſum from 1000l. to 2000l. the ſociety requires a double premium; and from 2000l. to 3000l. a treble premium, to be computed according to the above rates. In this ſociety every one of the aſſured is admitted to an equal ſhare of the profit or loſs in proportion to his *inſurance*. The ſociety has a demand on every member of 10s. per cent. and no more, in caſe of extraordinary loſſes and charges. The twenty-four directors employ as many porters as they think fit: their number is uſually twenty-four.

We have alſo *inſurances* for lives, in virtue of which, when the perſon inſured dies, a ſum of money becomes payable to the perſon on whoſe behalf the policy of *inſurance* was granted. The principal *inſurance* offices of this kind, are thoſe of the Amicable Society for a Perpetual *Aſſurance*, kept in Serjeant's inn, Fleet-ſtreet, London; and the Equitable *Aſſurance*-office, near Black-friars bridge. See ASSURANCE.

INTACTÆ, right lines to which curves do continually approach, and yet can never meet with them; more uſually called ASYMPTOTES.

INTAGLIOS, precious ſtones, having the heads of great men, inſcriptions, and the like, engraven on them; ſuch as we frequently ſee ſet in rings, ſeals, &c.

INTAKER, a name anciently given to certain banditi, or free-booters, who inhabited part of the North of England, and made frequent incurſions into the very middle of Scotland; plundering the inhabitants wherever they came.

Thoſe who made the expeditions, were called *out-parters*; and thoſe who were left behind to receive the booty, *intakers*. 9 Hen. V. c. 7.

INTEGERS, in *Arithmetic*, denote whole numbers; in contradiſtinction to fractions.

Integers may be defined to be, numbers which refer to unity, as a whole to a part.

INTEGRAL, or INTEGRANT, is applied by the ſchoolmen to thoſe parts which are neceſſary to the integrity of a whole. In which ſenſe they ſtand contradiſtinguiſhed from *eſſential* parts.

Thus the arms, legs, &c. are *integral* parts; body and ſoul, eſſential parts of a man.

INTEGRAL *calculus*, in the *New Analyſis*, is the counter part to the differential calculus.

This laſt has been completely explained by the marquis De l'Hopital's but the other ſtill remains imperfect, having been yet but little cultivated.

The *integral calculus* of Leibnitz, and other foreigners, anſwers to what the Engliſh call *inverſe method of fluxions*. See FLUXIONS, and CALCULUS.

INTEGRANT *parts*, in *Philoſophy*, the ſimilar parts of a body, or parts of the ſame nature with the whole: as filings of iron are *integrant* parts of iron, and have the ſame nature and properties with the bar they were filed off from. The chemiſts diſtinguiſh, in their reſolutions of bodies, between the dividing and reſolving them into *integrant* parts like theſe, and what they call conſtituent parts; that is, diſſimilar parts, or the principles of the bodies they work upon. Thus when crude mercury is diſſolved in aqua fortis, though held imperceptibly in the menſtruum; yet when that menſtruum is diluted with water, and a copper plate is ſuſpended in it, the menſtruum leaves the mercury, to work upon the copper, and the mercury ſubſides unaltered and in its own natural form: the mercury therefore, in this operation, was only divided into its *integrant* parts, or ſmall parcels of the ſame nature and properties of the whole; but when artificial cinnabar is reſolved or divided into crude mercury and ſulphur, neither of theſe are of the ſame nature and properties with the cinnabar, and are not its *integrant* but its conſtituent parts. This therefore is the dividing a body into its conſtituent parts or principles.

INTEGRITY *of the action*. See ACTION.

INTEGRUM *folium*, among *Botaniſts*. See LEAF.

INTEGRUM, *in reſtitutio*. See RESTITUTION.

INTEGUMENTS, formed of *in*, and *tegumentum*, of *tego*, *I cover*, in *Anatomy*, denote the common coverings which inveſt the body; as the cuticula, cutis, and even the panniculus carnoſus, and tunica reticularis, if there be really any ſuch parts.

INTEGUMENT is alſo extended to the particular membranes which inveſt certain parts of the body; as the coats or tunics of the eye.

INTELLECT, a term uſed among philoſophers, to ſignify that faculty of the ſoul uſually called the UNDERSTANDING.

The Peripatetics make two kinds of *intellect*; *active*, and *paſſive*. See IDEA.

INTELLECTUAL *thinking*. See THINKING.

INTELLIGIBLE, any thing capable of being underſtood, or conceived, by the mind.

Philoſophers have invented certain beings which are purely *intelligible* and only ſubſiſt in the underſtanding: ſuch are the *entia rationis*, univerſal ideas, and other chimæras.

The *intelligible*, or intellectual world, is the idea of the world in the divine mind, frequently ſpoken of by Malebranche.

INTENDANT, one who has the conduct, inſpection, and management, of any thing.

This is a title frequent among the French; they have *intendants of the marine*, who are officers in the ſea-ports, whoſe buſineſs it is to take care that the ordinances and regulations relating to ſea-affairs, be obſerved; *intendants of the finances*, who have the direction of the revenues; *intendants of provinces*, who are appointed by the king to take care of the adminiſtration of juſtice, policy, and finances, in the provinces; alſo, *intendants of buildings*, of *houſes*, &c.

INTENDMENT *of law*, the ſenſe, intention, or true meaning, of the law. See COMMON.

The judges ought to judge according to the common *intendment* of the law.

INTENDMENT *of crimes*: in caſes of treaſon, intention proved by circumſtances is puniſhable as if it were put in execution. So likewiſe, if a perſon enter the houſe in the night time, with intent to commit burglary, it is felony: and an aſſault on the high way, with an intent to commit burglary, is felony, and puniſhable with tranſportation. 23 Car. II. c. 1. 7 Geo. II. c. 21.

INTENSIONE, in *Law*, a writ which lies againſt him who enters after the death of the tenant in dower, or tenant for life, and holds out him in the reverſion, or remainder.

INTENSUM *diatonum*. See DIATONIC, and GENUS.

INTENT, in *Civil Law*, ſignifies to begin or commence an action, or proceſs.

INTENTION, or INTENSION, in *Medicine*, that judgment, or method, of cure, which a phyſician forms to himſelf from a due examination of the ſymptoms.

INTENTION, in *Phyſics*, the increaſe of the power of energy, of any quality; as heat, cold, &c.

By which it ſtands oppoſed to REMISSION; which ſignifies its decreaſe, or diminution.

INTENTION, in *Metaphyſics*, denotes an exertion of the intellectual faculties with more than ordinary force; when the mind with earneſtneſs fixes upon any idea, conſiders it on all ſides, and will not be diverted by any ſolicitation.

The ſchoolmen alſo ſpeak of terms of *firſt* and *ſecond intention*.

A term of firſt INTENTION is that which ſignifies a thing; the primary deſign of men, in eſtabliſhing words, being to expreſs things, or the ideas they have of things.

A term of ſecond INTENTION is that which does not ſignify a thing, but another term, or ſign.

Thus, a tree, a man, &c. are terms of *firſt intention*; and the terms in rhetoric, grammar, &c. as figure, kind, &c. are terms of *ſecond intention*.

IN-

INTENTION, *intentio*, *voltaire*, in the *Ancient Muſic*, was uſed to denote the paſſage of the voice from grave to acute.

INTENTIONAL *qualities*, ſee QUALITIES.

INTER *eoram & ſupum*, in *Law*, words uſed formerly in appeals to ſignify that a crime was committed in the twilight, i. e. *inter diem & veſperam*, &c. This part of a day has divers other denominations: thus, in ſome parts of England, they call it *much-shadows*, corruptly *much-ſhade*; and, in the north, *day light's gate*; others ſay, *betwixt hawk and buzzard*.

INTERCALARY *day*, denotes the odd day inſerted in the leap-year. See BISSEXTILE.

The word is derived from the Latin *intercalaris*, of *sub*, *calare*, which anciently ſignified, *to call with a loud voice*: an *intercalary* day, among the Romans, ſignifying a day inſerted between two other days; which, for that reaſon, was proclaimed by the prieſts with a loud voice.

INTERCALATION, ſee INTERPOLATION.

INTERCAPSULARIA, in *Anatomy*, a name given by ſome writers to the cavities between the ſcapulæ and the vertebræ.

INTERCEPTED *axis*, in *Conic Sections*, is the ſame with what is otherwiſe called the *abſciſſa*.

INTERCESSION, *interceſſio*, was uſed in *ancient Rome*, for the act of a tribune of the people, or other magiſtrate, by which he inhibited the acts of other magiſtrates; or even, in caſe of the tribunes, the decrees of the ſenate. *Veto* was the ſolemn word uſed by the tribunes when they inhibited any decree of the ſenate, or law propoſed to the people. The general law of theſe *intercaſſiones* was, that any magiſtrate might inhibit the acts of his equal, or inferior; but the tribunes had the ſole prerogative of controlling the acts of every other magiſtrate, yet could not be controuled themſelves by any.

INTERCESSOR, from *inter* and *cedo*, *I go between*, a perſon who prays, expoſtulates, or *intercedes*, in behalf of another.

In the Roman law, *intercaſſor* was the name of an officer, whom the governors of provinces appointed principally to raiſe taxes, and other duties.

INTERCESSION is alſo a term heretofore applied to ſuch biſhops as, during the vacancy of a ſee, adminiſtered the biſhoprick, till a ſucceſſor to the deceaſed biſhop had been elected. See BISHOP.

The third council of Carthage calls theſe *intervenores*.

INTERCIDENT *pulſe*, a term uſed by medical writers to expreſs a ſort of pulſe, in which between two regular ſtrokes there is perceived a third irregular.

INTERCOLUMNIATION, or INTERCOLUMNATION, in *Architecture*, ſignifies the ſpace between two columns. See the plan of *fig.* 40, in *Tab. Architecture*.

Vitruvius calls it *intercolumnium*; which, according to that author, is of five kinds; viz. *pieneſtyle*, A, one diameter and a half; *ſyſtyle*, B, two diameters; *euſtyle*, C, two and a quarter diameters, which is the moſt graceful; *diaſtyle*, D, three diameters; and *areoſtyle*, E, four diameters; which ſee explained under their proper heads, PICNOSTYLE, &c. The *intercolumniation* or ſpace between the columns in the arcade F, is ſeven and a half diameters; and the *intercolumniation* wherein there is a ſpace, G, of only one half a diameter, is called coupling columns, an invention aſcribed to the moderns.

From a medium, ſome authors have laid down the following proportions: in the Tuſcan order, the *intercolumniation* is to be four diameters of the body of the column below; in the Doric, three; in the Ionic, two; in the Corinthian, two one quarter; and in the Compoſite, one and a half.

INTERCOMMONING is when the commons of two manors lie together, and the inhabitants of both have, time out of mind, cauſed their cattle to feed promiſcuouſly in each.

INTERCOSTAL, in *Anatomy*, ſignifies any thing between the coſtæ, or ribs.

INTERCOSTAL *arteries*, are of two ſorts; the *upper*, which commonly comes from the lower ſide of the ſubclavian, and diſtributes itſelf within the four ſpaces of the upper ribs, ſending off under each rib a branch, which runs along the lower edge, and ſupplies the *intercoſtal* muſcles, and neighbouring parts of the pleura: ſometimes this artery comes from the cervicalis, and ſometimes from the aorta deſcendens, either by ſmall ſeparate arteries, or by a common trunk, which divides as it runs obliquely up upon the ribs: ſometimes it ariſes from the neareſt bronchialis, or from ſeveral bronchiales together; the *under* are commonly ſeven or eight on each ſide, and ſometimes ten, and ariſe along the back ſide of the deſcending aorta in pairs, all the way to the diaphragm, and run tranſverſly, towards each ſide, on the bodies of the vertebræ. Thoſe on the right ſide paſs behind the vena azygos, and afterwards they all run to the *intercoſtal muſcles*, along the lower edge of the rib, all the way to the *ſternum*, or near it. They ſend branches to the pleura, the vertebral muſcles, and thoſe muſcles which lie on the outſide of the ribs, and to the upper portions of the muſcles of the abdomen; and they communicate with the epigaſtric and lumbar arteries.

INTERCOSTAL *muſcles*, are either external or internal; and are forty-four in number, one of each ſort being between every two ribs.

They ariſe from the lower edges of each ſuperior rib, and are inſerted into the upper edges of each inferior rib. Their fibres croſs one another; thoſe of the external run obliquely from the back part forwards; but thoſe of the internal from the fore-part backwards; they are thin and fleſhy.—See *Tab. Anat. (Muſcul.) fig.* 2. *n.* 27.

Theſe muſcles are ſo many thin fleſhy plates, two between every two ribs, an external and an internal, cloſely joined together with only a thin cellular web between them. The fibres of the external *intercoſtals* are very oblique near the vertebræ; but this obliquity decreaſes inſenſibly as they approach the anterior extremities of the ribs. Their inſertions begin at the ligaments, by which the ribs are faſtened to the tranſverſe apophyſes. They are a little tendinous, and run a ſmall ſpace beyond the edge on the outſide of each rib. The fibres of the internal *intercoſtals* are in general ſhorter and leſs oblique than the former; they fill almoſt entirely the interſtices between the cartilaginous portions, and they are covered on the outſide by a ligamentary membrane, the fibres of which running in an oppoſite direction to thoſe of the muſcles, have been miſtaken for continuations of the external *intercoſtals*, over which this membrane is alſo ſpread, only a little diminiſhed in thickneſs.

Any portion of the breaſt of an animal may be boiled ſo much that the fleſh eaſily parting from the bones, the ribs may be drawn out, without diſordering either the muſcles or the membranes; but we are not for this reaſon to conclude, that all the *intercoſtals* on one ſide of the breaſt make but one muſcle; becauſe the ſame reaſoning might prove, that all the muſcles which immediately ſurround the os femoris are but one; ſince, by a like experiment, they together with the periofteum may be entirely ſeparated from the bone, without breaking their fibres. Winſlow's Anatomy, p. 231. For the uſe of theſe in reſpiration, ſee RESPIRATION.

INTERCOSTAL *nerves*, are two nerves ſo called, becauſe in deſcending they paſs near the roots of the ribs.—They are formed in the brain, by three branches of nerves, two whereof come from the ſixth pair, and the third from the fifth. The *intercoſtal* nerves have a great communication with thoſe of the eighth pair, and ſend ſeveral branches to the breaſt and lower belly.

Dr. Walther has given a very minute deſcription of the *intercoſtal nerves*, and eighth pair. See Nov. Act. Erud. Lipſ. 1734. Feb. & ibid. 1736. Sept.

INTERCOSTAL *vein*, is a vein which ariſes from the four ſpaces between the upper ribs, and terminates in the ſubclavian. See *Tab. Anat. (Angeiol.) fig.* 1. *n.* 31. *fig.* 6 *lit. f.* See ARTERIES.

INTERCUS, a word uſed by ſome medical writers, to expreſs that ſort of DROPSY more uſually called an ANASARCA.

INTERDICT, a cenſure inflicted by a pope, or biſhop, ſuſpending the prieſts from their functions, and depriving the people of the uſe of ſacraments, divine ſervice, and Chriſtian burial.

In common law, *interdict* is alſo uſed in the ſame ſenſe as in the canon law; where it is defined to be, *cenſura eccleſiaſtica prohibens adminiſtrationem divinorum*.

INTERDICT is moſt properly underſtood of a general excommunication of a country, or city, as appears by the Decretals. See EXCOMMUNICATION.

There is a *local*, and a *perſonal interdict*: where theſe two are joined, the *interdict* is ſaid to be *mixed*.

This puniſhment, as well as general excommunications, were but little known till the time of pope Gregory VII. In the year 1169, pope Alexander III. put all England under an *interdict*, forbidding the clergy to perform any part of divine ſervice, except the baptizing of infants, taking confeſſion, and giving abſolution to dying penitents.

In excommunicating a prince, all his adherents, that is, his ſubjects who retain their allegiance, are excommunicated, and the whole country is put under an *interdict*. In the reign of king John, the kingdom of England lay under a papal *interdict* for above ſix years together: it began A. D. 1208.

In imitation of the popes, the biſhops alſo ſoon began to *interdict*; and it became a common thing for a city, or town, to be excommunicated for the ſake of a ſingle per-

lon whom they undertook to shelter; but this severity was found to have such ill effects, that they have been obliged to moderate it.

An *interdict* is denounced, and taken off again, with the same formalities as an excommunication.

INTERDICTS, in the *Roman Law*, certain formulæ of words by which the prætor, when the poſſeſſion of any thing was conteſted between many, ordered or forbid ſomething to be done with it, till the right or property ſhould be legally determined.

Which formulæ were called *interdicti*, becauſe they reſtored to the poſſeſſion of the thing in the interim, or till the right was aſcertained.

They had three kinds of *interdicti*: *prohibitory*, *reſtitutory*, and *exhibitory*.

INTERDICTS, *prohibitory*, were thoſe by which the judges forbad any one to vex another in the poſſeſſion of any thing legally belonging to him.

Reſtitutory were thoſe by which the judges appointed any one, who had been expelled out of his eſtate, to be repoſſeſſed, before his right was legally aſcertained; and this was the ſame with what they called the *reintegrant*.

Exhibitory were thoſe by which any thing in diſpute was ordered to be exhibited: as a teſtament, &c.

There was alſo a ſecond diviſion of *interdicts*; viz. into *adipiſcendæ*, *retinendæ*, and *recuperandæ*: the firſt tending to the acquiring a new poſſeſſion, as the *interdict quorum bonorum*, &c. the ſecond to the keeping an old one till it was farther determined, as the *uti poſſidetis*, &c. the laſt to the recovering one loſt, as *unde vi*, &c.

INTERDICTION *of water and fire*, a ſentence anciently pronounced againſt ſuch as, for ſome crime, were to be baniſhed.

They were not directly adjudged to baniſhment; but by giving order, that nobody ſhould receive them, but deny them *fire and water*, they were condemned, as it were, to a civil death: and this they called *legitimum exilium*. Livy. See EXILE.

INTEREST, a ſum of money, reckoned for the loan and forbearance of ſome other ſum, lent for, or due at, a certain time, according to ſome certain rate.

In reſpect hereof, the ſum lent, or forborn, is called the *principal*, becauſe it is the ſum that procreates the *intereſt*, or from which the *intereſt* is reckoned.

As to the rate of legal *intereſt* in this country, it has varied and decreaſed for 200 years paſt, according as the quantity of ſpecie in the kingdom has increaſed by acceſſions of trade, the introduction of paper credit, and other circumſtances. The ſtat. 37 Hen. VIII. c. 9. confined *intereſt* to 10 *per cent.* and ſo did the ſtat. 13 Eliz. c. 8. But 21, through the encouragement given in her reign to commerce, the nation grew more wealthy, ſo under her ſucceſſor, the ſtat. 21 Jac. I. c. 17. reduced it to 8 *per cent.* as did the ſtat. 12 Car. II. c. 13. to 6: and, laſtly by the ſtat. 12 Ann. ſt. 2. c. 16. it was brought down to 5 *per cent.* yearly, which is now the extremity of legal *intereſt* that can be taken. But yet, if a contract which carries *intereſt*, be made in a foreign country, our courts will direct the payment of *intereſt* according to the law of that country in which the contract was made. Thus Iriſh, American, Turkiſh, and Indian *intereſt* have been allowed to the amount of even 12 *per cent.* Blackſtone's Com. b. ii. p. 463.

Intereſt is either *ſimple*, or *compound*.

INTEREST, *ſimple*, is that counted from the principal only. Let p repreſent the principal, n the number of years or parts of a year, r the rate of 1*l. per annum*, and m the amount of the principal p for the time n at the rate r; and ſince the amount of 1*l.* for one year is $1+r$, the amount of 1*l.* for n years, muſt be $1+nr$; the *intereſt* of the principal p at the rate r in n years muſt be pnr; and $1l.+nr :: pl.+pnr = m$ the amount: from this general theorem we can eaſily deduce problems for reſolving all the caſes that occur in ſimple *intereſt*.

Prob. I. Having any principal ſum, and time, and rate of *intereſt* given, to find the amount: as $m=p+pnr = p \times 1+nr$; we ſhall have this rule: to the product of the rate of 1*l. per annum* by the number of years add unit, and multiply the ſum by the given principal. E. g. what ſum will 567*l.* 10*s.* amount to in nine years at 5 *per cent. per annum*. Here $p = 567\,5$, $n = 9$, and $r = .05$: becauſe $100 : 5 :: 1 : .05$: therefore $m = p \times 1+nr = 567\,5 \times 1+.45 = 822.875 = 822l.$ 17*s.* 6*d.* Or if it were required to find the amount of one penny at 5 *per cent.* Simple intereſt in 1780 years; $p = 1l.$ $n = 1780$ and $r = .05$, therefore $m = 1 \times 1+89 = 90 = 7l.$ 6*d.*

If the time given does not conſiſt of whole years, it may be eaſily reduced to decimal parts of a year.

Prob. II. Having the amount of any principal at a given rate in a given time to find the principal; it appears from the theorem, $m = p \times 1+nr$, that $p = \frac{m}{1+nr}$ i. e. divide the amount by the product of the time and rate of 1*l. per annum*, with unit added to it. E. g. what principal will amount to 822*l.* 17*s.* 6*d.* in nine years at 5 *per cent. per annum*: here $m = 822l.$ 17*s.* 6*d* or 822.875, and n, r as before: therefore $\frac{m}{1+nr} = \frac{822.875}{1+.45} = 567l.$ 10*s.* or 567*l.* 10*s.*

Prob. III. Having the amount of a given principal at a given rate, to find the number of years. From the theorem we eaſily deduce, by tranſpoſition and diviſion, $n = \frac{m-p}{pr}$ viz. ſubtract the principal from the amount and divide the remainder by the product of the principal and rate. E. g. in what time will 567*l.* 10*s.* amount to 822*l.* 17*s.* 6*d.* at 5 *per cent. per annum*? $n = \frac{m-p}{pr} = \frac{822.875-567.5}{28.375} = \frac{255.375}{28.375} = 9.$

Prob. IV. Having the amount of a given principal in a given time to find the rate, and conſequently the *intereſt per cent.* From the theorem we eaſily derive $r = \frac{m-p}{pn}$, i. e. ſubtract the principal from the amount, and divide by the product of the principal into the number of years; e. g. at what rate *per cent.* will 567*l.* 10*s.* amount to 822*l.* 17*s.* 6*d.* in nine years? Here $\frac{m-p}{pn} = \frac{822.875-567.5}{5107.5} = \frac{255.375}{5107.5} = .05$; and, therefore, the *intereſt* is 5 *per cent.*

Prob. V. The annual *intereſt* of any principal p at the rate r, is pr; i. e. multiply the principal by the rate: e. g. the *intereſt* of 75*l.* for one year at 3 *per cent.* is $75 \times .03 = 2.25 = 2l.$ 5*s.* The *intereſt* of 157*l.* 17*s.* 6*d.* at 5 *per cent.* is 157.875 (reducing the 17*s.* 6*d.* to DECIMALS of a pound) $\times .05 = 7.89375 = 7l.$ 17*s.* 10*d.*$\frac{3}{4}$. The *intereſt* of any principal p at the rate r for n years, is $pr \times n$ obtained by multiplying the principal rate, and number of years.

The daily *intereſt* is found by dividing the annual *intereſt* by 365; thus .05, being the *intereſt* of one pound one year at 5 *per cent.* divided by 365, the quotient will be .0001369, &c. which is the *intereſt* of one pound for one day, at the ſame rate. And $\frac{.03}{365} = .0000821$ is the *intereſt* of one pound for one day, at 3 *per cent per annum*. The *intereſt* for one day, at any rate, being thus found, that *intereſt* multiplied by 2, 3, 4, 5, 6, &c. gives the *intereſt* of one pound for any number of days: and thus the following table of ſimple *intereſt* for any number of days is eaſily made.

A TABLE of SIMPLE INTEREST.

The *intereſt* of one pound for any number of days, &c.

The Uſe of the preceding Table.

When the *interest* of any ſum of money is required for any number of days, look in the tables for the number of days, and even with that number, under the given rate of intereſt, will be found the intereſt of one pound, for that time, and at that rate; which intereſt, ſo found, being multiplied by the principal ſum, the product anſwers the queſtion.

EXAMPLE.

What is the intereſt of 462*l.* for 85 days, at 5 per cent. per annum?

In the table, even with 85 days, and under 5 per cent. you find the *intereſt* of 1*l.* to be 0.01 16438.

Which multiplied by the principal 462, the product will be 5*l.* 7*s.* 7*d.*

N. B. If the principal ſums contain ſhillings and pence, you muſt reduce them into decimal parts, and multiply accordingly.

When the *intereſt* of any ſum is required for a number of years and days together, as it frequently happens upon paying off a bond or mortgage, add the *intereſt* of one pound for the years at the end of the foregoing tables, to the intereſt of one pound for the odd days; multiply that by the principal ſum, and the product will anſwer the queſtion.

The following Table is much more compendious; and ſhews the *intereſt* of any ſum of money, from a million to a pound, for any number of days, at any rate of *intereſt*.

N°	*l.*	*s.*	*d.*	*q.*	N°	*l.*	*s.*	*d.*	*q.*
1000000	2739	14	0	0.99	1000	2	14	9	2.14
900000	2465	15	0	3.29	900	2	9	3	3.42
800000	2191	15	7	1.59	800	2	3	10	0.11
700000	1917	16	1	3.89	700	1	18	4	1.10
600000	1643	16	8	2.19	600	1	12	10	2.80
500000	1369	17	3	0.49	500	1	7	5	3.70

200000	574	18	10	3.40	200	0	10	11	2.30
100000	273	19	5	1.70	100	0	5	5	3.15
90000	246	11	6	0.96	90	0	4	11	0.73
80000	219	3	6	0.96	80	0	4	4	2.41
70000	191	15	7	1.59	70	0	3	10	0.11
60000	164	7	8	0.22	60	0	3	3	1.83
50000	136	19	8	2.85	50	0	2	8	0.51
40000	109	11	9	1.48	40	0	2	2	1.21
30000	82	3	10	0.11	30	0	1	7	2.90
20000	54	15	10	2.74	20	0	1	1	0.60
10000	27	7	11	1.37	10	0	0	6	2.30
9000	24	13	1	3.23	9	0	0	5	3.67
8000	21	18	4	1.10	8	0	0	5	1.40
7000	19	3	6	2.96	7	0	0	4	2.13
6000	16	8	9	0.82	6	0	0	3	3.76
5000	13	13	11	2.58	5	0	0	3	1.15
4000	10	19	2	0.53	4	0	0	2	2.52
3000	8	4	4	2.47	3	0	0	1	3.80
2000	5	9	7	0.27	2	0	0	1	1.26
1000	2	14	9	2.14	1	0	0	0	2.63

Multiply the ſum by the number of days, and the product thereof by the rate of *intereſt* per cent. then cut off the two laſt figures to the right hand, and enter the table with what remains to the left; againſt which numbers collected, you have the *intereſt* for the given ſum.

EXAMPLE.

What is the *intereſt* of 100*l.* at 5 per cent. for 365 days?

			l.	*s.*	*d.*	*q.*
N° of days 365	Then in the table

182500		5 -	0	0	3	1.15
		1825 anſ.	5	0	0	0.00

the *intereſt* required. Ferguſon's Tracts, p. 274.

For the method of calculating annuities, ſee ANNUITIES.

INTEREST, *compound*, is that which is counted both from the principal, and the *ſimple intereſt* forborne; called alſo *intereſt upon intereſt*.

Compound intereſt ariſes from the principal and its *intereſt* put together, as that *intereſt* becomes due. To find this, it is neceſſary to find the *new principal*, which is ſtill created by the increaſe of the growing money, at the ſeveral times when the payments of *intereſt* were due.

Although it be not lawful to lend money at compound *intereſt*, yet in purchaſing annuities, penſions, &c. and taking leaſes in reverſion, it is uſual to allow *compound intereſt* to the purchaſer for his ready money; and, therefore, it is very neceſſary to underſtand this ſubject. Let *p*, *r*, *n*, and *m*, be as before; and let *s* be equal to 1 + *r*, or the principal and *intereſt* of 1*l.* for any given time, at

any

any given rate. Then as one pound is to its amount for any given time, so is any proposed principal sum to its amount for the same time: i. e.

1*l*. : r :: p : $p \times r$ = 1st year's amount.
1*l*. : r :: $p \times r$: $p \times r^2$ = 2d year's amount.
1*l*. : r :: $p \times r^2$: $p \times r^3$ = 3d year's amount, &c.

Therefore $p \times r^n = m$ the amount of the n years, whence we deduce particular theorems for the solution of the following problems.

Prob. I. Given the principal p, rate r, and time n, to find the amount: $m = p \times r^n$, or log. p + log. $r \times n$; i. e. multiply the rate of 1*l*. added to unit into itself as often as unit is contained in the number of years, or raise it to a power whole index is n, and multiply this product by the given principal. Or, multiply the logarithm of the rate added to unit, found in tables of logarithms, by the number of years, and add the logarithm of the principal; the number answering to the sum of these logarithms will be the required amount. E. g. What sum will 450*l*. amount to in three years, at 5 *per cent. per annum*? Here $p = 450$, $n = 3$, and $r = 1.05$: and $p \times r^n = 450 \times 1.05^3 = 450 \times 1.157625 = 520$*l*. 18*s*. 7*d*. Otherwise, the log. of $450 = 2.653212$ and the log. of $1.05 = 0.0211893$, which multiplied by 3, gives .0635679; and $2.653212 + 0.0635679 = 2.7167804$, the number answering to which is 520.93, nearly. $= 520$*l*. 18*s*. 7*d*. Farther, what is the amount of one penny at 5 *per cent. compound interest*, in 1780 years? Here $p = 1d.$ $r = 1.05$, and $n = 1780$. The logarithm of 1.05, or 0.0211893 × 1780 = 37.7169540, the log. of the number of pence in the amount; and 37.7169540 − 2.3802112, the log. of 240, the number of pence in a pound, will give 35.3367428, the log. of the number of pounds in the amount. But this number is so large, that it will be necessary to compare it with some other measure: let this measure be the number of pounds sterling contained in a globe of gold equal in bulk to our earth; which may be easily determined by the following calculation.

3.954483 the log. of 9000, the diameter of the earth.
3 multiply by 3 for the cube of the diameter.
11.863449 the log. of the cube of the diameter.
Add. 6.758096 the log. of 5736. See Simpson's Geom. p. 186.
9.778586 the log. of 5280 or number of yards in a cubic mile.
1.461368 the log. of 29, the number of cubic feet in a cubic yard.
3.237147 the log. of 1728, the numb. of cub. inches in a solid foot.
25.1886201 the log. of the number of cubic inches in the earth.
Add. 1.561893 { the log. of 38.45, the number of pounds in a cubic inch, Troy-lb. of 5760 Troy ounces equal to a cubic inch of Guinea gold (*See Specific* GRAVITY), and 3*l*. 17*s*. 10½*d*. = 38.45, to be an ounce.
27.3005326 { the log. of the number of pounds sterling on the earth, supposing that it were solid gold.
From 35.3367428 the log. of the amount, above found.
Subtr. 8.3638102 the log. of 2304490000.
7.4029325 the log. of 2528500, the number of cubic inches of solid gold contained in the amount.

These calculations suppose that money doubles itself at 5 *per cent. compound interest*. In 14 years 73 days; but on the supposition that it doubles itself in 14 years, the calculation will be as follows: $\frac{1780}{14} = 127\frac{1}{2}$; and then 2 may be raised to the 127th power, thus:

.3010300 the log. of 2
Mult. 127
38.2708100 the amount in pence.
Subtract 7.3802112 the log. of 240.
35.8905988 the log. of the number of pounds.
Subtract 27.3005326 { the log. of the pounds sterling in an earth of solid gold.
8.4600812 the log. of 288490000, the number of earths of solid gold contained in the amount.

A shilling put out to 6 *per cent. compound interest*, would, in the same time, have increased to a greater sum in gold than the whole solar system could hold, supposing it a sphere equal in diameter to the diameter of Saturn's orbit; and the earth is to such a sphere nearly as half a square foot, or a quarter page, to the whole surface of the earth. Price on Reversionary Payments, p. 15. Pref. to first edition.

N. B. If the time in this problem is an aliquot part of a year, as $\frac{1}{2}$, $\frac{1}{4}$, or universally $\frac{1}{n}$th, take the amount of 1*l*. for one year, or r, and from it extract the nth root, i. e. the square root, if it be half a year, the cube root, if it be $\frac{1}{3}$, the biquadrate if it be $\frac{1}{4}$, &c. and that root is the amount sought. Thus the amount of 1*l*. for half a year is $1.05^{\frac{1}{2}} = 1.02469$, &c. The reason is obvious, because 1 : 1.05 :: 1.05 : 1.05; consequently 1.05 1*l*. or 1.02469, put out to *interest* for half a year, amounts to 1.05, according to the rate allowed for the first half year; which is 1.02469, the principal for the second half year. If the time is $\frac{1}{3}$ of a year, we must suppose two geometrical mean proportionals between 1 and r, the first of which will be equal to $\sqrt[3]{r}$; and in all cases, whatever number of terms n intervene between 1 and r, the first of them is such a root of r, whose denominator is the number of terms, as $r^{\frac{1}{n}}$; and $r^{\frac{1}{n}}$ is a principal which bearing compound *interest* at the given rate for the nth part of one year, will amount to r at the year's end. But if the time is not an aliquot part of the year, reduce it to days; and the 365th root of it will be the amount for one day, which is easily done by logarithms, when questions occur that render it necessary; then raise that amount to a power whose index is the number of days in the question for the amount sought. In this way, tables of compound *interest*, shewing the amount of 1*l*. in any number of days and years, are found. See ANNUITIES.

See also Smart's Tables of *Interest*, &c.

Prob. II. From the amount, rate, and time, to find the principal: by equal division from the theorem, $p = \frac{m}{r^n}$, or log. m − log. $r \times n$.

Rule. Divide the amount by the sum of the rate and unit raised to a power denominated by the number of years, &c. E. gr. What principal will amount to 520*l*. 18*s*. 7½*d*. or 520.93125, in three years, at 5 *per cent.*?

And $\frac{520.93125}{1.157625} = 450$*l*.

Prob. III. From the principal, amount, and rate, to find the time: $n^x = \frac{m}{p}$, and $x =$ to the number of divisions of n^x by n, till there be no remainder: or $x = \text{log. } n^x \div \text{log. } n$.

Rule. Divide the amount by the principal, and this quotient by the rate added to unit, and repeat the division of each new quotient till there be no remainder; and the number of divisions gives the number of years: Or divide the logarithm of the rate added to unit, and raised to the power expressed by the number of years, and divide by the logarithm of the rate added to unit. E. gr. In what time will 450*l*. amount to 520*l*. 18*s*. 7½*d*. or 520.93125, at 5 *per cent. per annum*? $\frac{m}{p} = \frac{520.93125}{450} = 1.15$ which divided by 1.05, till there be no remainder, require three divisions; and, therefore, the number of years is equal to 3.

Prob. IV. From the principal, amount, and time, to find the rate: $n^x = \frac{m}{p}$; therefore $x = \frac{m}{p} \cdot \frac{1}{n}$, or $x = \text{log. } m - \text{log. } p \div n$.

Rule. Divide the amount by the principal, and extract that root of the quotient which is denominated by the number of years. E. gr. At what rate *per cent.* will 450*l*. amount to 520*l*. 18*s*. 7½*d*. or 520.93125, in 3 years? $\frac{m}{p} = 1.157625$; and $\sqrt[3]{1.157625} = 1.05$: consequently, the answer is 5 *per cent.* See farther on this subject, Jones's Synopsis Palmariorum Matheseos, part i. § 3. cap. 10. Malcolm's Arithmetic, book vi. ch. 10. Gardiner's tables of Logarithms, p. 8. Phil. Trans. vol. li. art. 43. p. 508. See also ANNUITIES, DISCOUNT, LIFE-*Annuities*, REVERSIONS, &c.

INTEREST, *Interesse*, in *Law*, is commonly taken for a chattel real, as a lease for years, &c. and more particularly for a future term; in which sense it is said in pleading, that one is possessed *de interesse termini*: therefore an estate in lands, is better than a right or *interest* in them. But in legal understanding, an *interest* extends to estates, rights, and titles, that a man hath in or out of lands, &c. so as by grant of his whole *interest* in such lands, a reversion thereon, as well as possession in fee-simple, shall pass.

INTEREST *in legacies*. In case of a [illegible] immediately, and charged on land [illegible] which yield an immediate profit, [illegible] thereon from the testator's [illegible] the personal estate, which cannot [illegible] it shall carry *interest* only from the [illegible] the death of the testator. If a legacy be [illegible], and no certain time of payment mentioned, and the legatee be an infant, he shall have *interest* for the legacy from the expiration of one year after the testator's death; but if the legatee be of full age, he shall have no *interest* but from the time of the demand of the legacy. Where a legacy is payable at a day certain, it must be paid with *interest* from that day.

INTEREST, *summary*. See PUNITORY.

INTERFEMINEUM, a word used by some to express the perinæum.

INTERFERE, in the *Manage*. A horse *interferes*, when the

the side of one of the shoes strikes against and hurts one of the fetlocks. See CUTTING.

INTERJECTION, in *Grammar*, an expreſſion uſed to denote ſome ſudden motion or paſſion of the mind: as *oh! ah!*

As the greateſt part of the expreſſions uſed on theſe occaſions are taken from nature alone, the real *interjections* in all languages are monoſyllables; and as all nations agree in thoſe natural paſſions, ſo do they agree in the ſigns and indications of them; as of love, mirth, &c.

Some deny the *interjections* to be words, or any part of ſpeech; and make them mere natural ſigns of the motions and paſſions of the mind, expreſſed by theſe inarticulate ſounds, ſeveral whereof brutes have in common with us: but as theſe are paſſions, and muſt be repreſented in diſcourſe, *the interjection* has a good foundation in nature, and is a neceſſary part of ſpeech.

Mr. Harris obſerves, that *interjections* coincide with no part of ſpeech, but are either uttered alone, or elſe thrown into a ſentence, without altering its form, either in ſyntax or ſignification; and that they are not ſo properly parts of ſpeech, as adventitious ſounds; certain voices of nature rather than voices of art, expreſſing thoſe paſſions and natural emotions, which ſpontaneouſly ariſe in the human ſoul, upon the view or narration of intereſting events. Hermes, p. 289.

The Greeks confound their *interjections* with *adverbs*, and the Hebrews confound them with their *adverbs* and *prepoſitions*; calling them all by their general name *particle*.

INTERIM, a term borrowed from the Latin, ſignifying *in the mean time*. It was firſt brought into popular uſe by Charles V. in 1548, in order to compoſe the diſturbances of Germany.

The *interim* of that prince was a kind of ordinance, or regulation, to be obſerved in the empire, with regard to the articles of religion then controverted, till ſuch time as they ſhould be determined by a council; and therefore was called *interim*.

It was ſaid to have been drawn up by two catholics and a proteſtant; but as it retained moſt of the doctrines and ceremonies of the Romaniſts, though expreſſed for the moſt part in the ſofteſt words, or in ſcriptural phraſes, or in terms of ſtudied ambiguity, excepting that of marriage, which was allowed to prieſts, and communion, which was adminiſtered to the laity under both kinds, moſt of the proteſtants rejected it. Thoſe who admitted it were nick-named *Interimiſts*, or ADIAPHORISTS. Indeed the *interim* equally diſguſted the generality of both parties, the proteſtants and catholics.

Beſides this, there were two other *interims* made: the one called the *interim* of Leipſic, the other by the divines of Franconia, who, refuſing to accept the two former, made another for themſelves.

INTERIOR. See INTERNAL and INTERNUS.

INTERIOR *figure, angle of.* See ANGLE.

INTERIOR *polygon.* See POLYGON.

INTERIOR *ſtilus.* See TALUS.

INTERLINEATION, ſomething inſerted between two lines. See DEED.

INTERLOCUTORY *decree.* In a ſuit of equity, if any matter of fact be ſtrongly controverted, the fact is uſually directed to be tried at the bar of the court of king's bench, or at the aſſizes, upon a feigned iſſue. If a queſtion of mere law ariſes in the courſe of a cauſe, it is the practice of the court of chancery to refer it to the opinion of the judges of the court of king's bench, upon a caſe ſtated for that purpoſe. In ſuch caſes, *interlocutory* decrees or orders are made.

INTERLOCUTORY *judgments* are ſuch as are given in the middle of a cauſe, upon ſome plea, proceeding on default, which is only intermediate, and does not finally determine or complete the ſuit. But the *interlocutory* judgments muſt uſually be ſpoken of, are thoſe incomplete judgments, whereby the right of the plaintiff is eſtabliſhed, but the *quantum* of damages ſuſtained by him is not aſcertained, which is the province of a jury. In ſuch caſe a writ of enquiry iſſues to the ſheriff, who ſummons a jury, enquires of the damages, and returns to the court the inquiſition ſo taken, whereupon the plaintiff's attorney ſees rolls, and ſigns final judgment.

INTERLOCUTORY *order*, that which decides not the cauſe, but only ſettles ſome intervening matter relating to the cauſe.

As, where an order is made in chancery, for the plaintiff to have an injunction, to quit poſſeſſion till the hearing of the cauſe; this order, not being final, is called *interlocutory*.

INTERLOPING, the intercepting, or diſturbing, the traffic of a company; or the taking up a new trade or employment, to the prejudice of thoſe who were brought up in it.

INTERLOPERS are properly thoſe, who, without due authority, hinder the trade of a company, or corporation, lawfully eſtabliſhed, by dealing in the ſame way.

INTERLUCATION, in *Huſbandry*, the thinning of a wood, or letting in light between, by lopping or cutting away boughs.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play; to amuſe the ſpectators while the actors take breath, and ſhift their dreſs; or to give time for changing the ſcenes and decorations.

In the ancient tragedy, the chorus ſung the *interludes*, to ſhew the intervals between the acts.

Interludes, among us, uſually conſiſt of ſongs, dances, feats of activity, concerts of muſic, &c.

Ariſtotle and Horace give it for a rule, that the *interludes* ſhould conſiſt of ſongs built on the principal parts of the drama; but ſince the chorus has been laid down, dancers, buffoons, &c. ordinarily furniſh the *interludes*.

INTERLUNIUS *morbus*, a name by which ſome authors have called the EPILEPSY, a diſeaſe that has been ſaid to be often affected remarkably by the changes of the moon

INTERMEDIATE is uſually underſtood of the ſpace of time elapſed from any certain point to any other.

In *Chemiſtry*, thoſe ſubſtances are called *intermediate*, by means of which, other ſubſtances, incapable of uniting together of themſelves, may be united.

INTERMEWING, in *Falconry*, is a hawk's *mewing*, from the firſt change of her coat till ſhe turn white.

INTERMITTENT, a thing which ceaſes its action for ſome time; which time is called the *interval*.

Thus FEVERS which go off, and ſoon return again, are called *intermittents*, in oppoſition to thoſe which are always continued.

So a pulſe which after ſo many ſtrokes ſtops, or loſes one in its due time, is called an *intermitting* PULSE.

With regard to this it has been obſerved, that as often as the ſtomach is much inflated with wind, the nerves or plexus cardiacus at its orifice muſt ſuffer a contraction, which, being continued to the heart, will occaſion a twitching; and this, as it is more or leſs violent, will produce either only a ſimple *intermiſſion* of pulſe, or a real palpitation of the heart.

INTERNAL *angles* are all *angles* made by the ſides of any right-lined figure within. See *Internal* ANGLE.

In a triangle, as KLM *(Tab. III. Geometry, fig. 55.)* the angles L and M are particularly called *internal* and *oppoſite*, in reſpect of the external angle IKM, which is equal to them both.

INTERNAL *angle* is alſo applied to the two angles formed between two parallels by a line interſecting thoſe parallels, on each ſide the interſecting line.

Such are the angles *z* and *y*, and *x* and *v* *(Tab. III. Geometry, fig. 56.)* formed between the parallels OP and QR, on each ſide of the interſecting line ST.

The two *internal angles* are always equal to two right angles.

INTERNAL and *oppoſite angle* is alſo applied to the two angles *z* and *x*, formed by a line cutting two parallels.

Theſe are reſpectively equal to A and *u*, called the *external* and *oppoſite angles*.

INTERNAL *affection, denomination, ear, mode, orthography, place, ſenſe.* See the ſubſtantives.

INTERNODIUM, in *Botany*, the ſpace that is between two knots, or joints, of the ſtalk of a plant; e. gr. of the ſtalk or ſtraw of wheat, or other corn.

INTERNUS *brachiæus, rectus major capitis, rectus minor capitis, cubitæus, iliacus, orbiter, pterygoideus, ſuſpus.* See BRACHIÆUS, RECTUS, &c.

INTERNUS *malleï*, in *Anatomy*, a name given by ſome authors to one of the muſcles of the ear. It is the *muſculus internus auris* of Cowper, and is very properly called by Albinus *tenſor tympani*, from its uſe. Spigelius calls it ſimply the *internus*.

INTEROSSEI *minores*, the muſcles which move the fingers: thus called from their ſituation, as being contained *inter oſſa*, between the ſpaces of the bones of the metacarpus. Some reckon ſix of them, and others eight. One half lie between the ſpaces theſe bones leave towards the palm of the hand; theſe are called the *interoſſei interni*, ariſing from the upper part of the bones of the metacarpus next the carpus; and, being inſerted on the internal ſides of the firſt bones of the fingers with the lumbricales, ſerve as adductores digitorum, to bring the fingers to the thumb.

The other half, called *interoſſei externi*, are contained in the ſpaces that the bones of the metacarpus leave on the back of the hand; theſe riſe from the upper part of the bones of the metacarpus next the carpus, and are inſerted on the external ſides of the firſt bones of the fingers: theſe ſerve, as abductores digitorum, to draw the fingers from the thumb. See *Tab. Anat. (Myol.) fig. 6. n. 23. fig. 7. n. 9. 50.*

INTEROSSEI *pedis*, the muscles which move the toes; in number, use, origin, and insertion, they answer exactly to those of the hand.

INTEROSSEOUS *arteries*, are two arteries, derived from the cubital artery, where in its course between the heads of the radius and ulna it reaches the INTEROSSEOUS *ligament*: they are the internal and external. The internal artery runs close to the ligament, till it extends below the pronator teres, where it perforates the ligament, and passes to the convex side of the carpus, and back of the hand, where it communicates with the external *interosseous*, the radial, and the cubital arteries. The external *interosseous* artery pierces the ligament about three fingers breadth below the articulation, and sends off a branch towards the external condyle of the os humeri, under the ulnaris externus, and anconeus minimus, to which it is distributed, as also to the supinator brevis. Having reached the lower extremity of the ulna, it unites with a branch of the internal *interosseous* artery, and is distributed with it on the convex side of the carpus and back of the hand, communicating with the radial artery, and with a branch of the cubital. By these communications this artery forms an irregular arch, from whence branches are sent to the external *interosseous* muscles, and to the external lateral parts of the fingers.

INTEROSSEOUS *ligaments* in the fore-arm, are fixed by one edge along the sharp angle of each ulna, and by the other along that of the radius. They are chiefly made up of two very strong planes of fibres, which cross each other at oblique angles, and leave holes at different distances for the passage of blood-vessels. They serve to tie the two bones closely together, and the two planes serve for the insertion of several muscles. In the supination of the hands they are very tight; but in the pronation they are folded a little lengthways.

INTEROSSEUS, in *Anatomy*, a name given by Spigelius in his account of the muscles of the foot, to a muscle called by Albinus the *flexor brevis pollicis pedis*, and by Winslow the *flexor brevis*.

INTERPLEAD, or ENTERPLEAD. See ENTERPLEADER.

INTERPOLATION, a term used by critics in speaking of ancient writings and manuscripts, in which some spurious additions or alterations have been since made.

To establish or ascertain an *interpolation*, P. Ruinart gives us the five following rules. 1. That the piece supposed to be *interpolated* appear to have all the antiquity it pretends to. 2. That there be good proofs that it has been *interpolated*. 3. That the supposed *interpolations* agree to the time of the *interpolator*. 4. That the *interpolations* do not touch the foundation of the work; and that they be not too frequent, nor entirely disfigure the piece. 5. That the restitution made, agree perfectly to the rest of the work.

INTERPOLATION, in *Algebra*, is used for the finding an intermediate term of a series, its place in the series being given. This is also called *intercalation*.

The method of doing this is called the *method of interpolation*, or *interpolations*.

When the algebraic equation of the series is given, the term required, whether it be a primary or intermediate term, may be found by the resolution of affected equations; but when this equation is not given, as it often happens, the value of the term sought must be exhibited by a converging series, or by the quadrature of curves. See Stirling, Method. Different. p. 86, seq. Meyer, in Act. Petrop. tom. ii. p. 180, seq.

When the first, second, or other successive differences of the terms of a series become at last equal, the *interpolation* of any term of such a series may be found by sir Isaac Newton's DIFFERENTIAL *method*.

The method of *interpolation* was first invented by Mr. Brigg, Savilian professor of Geometry at Oxford, and applied by him to the calculation of logarithms. His principles were followed by Reginald and Mouton, in France. Sir Isaac Newton, in lemma 5. lib. iii. Phil. Princip. Mathem. gave a most elegant solution of the problem for drawing a curve line through the extremities of any number of given ordinates; and in the subsequent proposition applied to the solution of this problem to that of finding from certain observed places of a comet, the place of it at any given intermediate time. Dr. Waring, who adds, that a solution still more elegant, on some accounts, has been since discovered by Mess. Nicholi and Stirling, has also resolved the same problem and rendered it more general, without having recourse to finding the successive differences. Phil. Trans. vol. lxix. part 1. art. 7.

INTERPOSED *Aids*. See ATTIC.

INTERPOSITION, the situation of a body between two others, so as to hide them, or prevent their action.

The eclipse of the sun is occasioned by an *interposition* of the moon between the sun and us; and that of the moon by the *interposition* of the earth betwee the sun and moon.

INTERPRETER, a person who explains the thoughts, words, or writings, of some other, which before were unintelligible.

The word *interpres*, according to Isidore, is composed of the preposition *inter* and *pretium*, as signifying a person in the middle betwixt two parties, to make them mutually understand each other's thoughts. Others derive it from *inter* and *pres*, i. e. *fidejussor*; q. d. a person who is as security betwen two others, who do not understand one another.

There have been great debates about *interpreting* Scripture. The Romanists contend, that it belongs absolutely to the church; adding, that were she is silent, reason may be consulted; but, where she speaks, reason is to be disregarded. The Protestants generally allow reason to be the sovereign judge, or *interpreter*, though some among them have a strong regard to synods, and others to the authority of the primitive fathers. Lastly, others have recourse to the spirit within every person to *interpret* for them; which is what Bochart calls αυτοδιδακτα και αυτομαθεις.

INTERREGNUM, the time during which a throne is vacant, or a kingdom without a head.

In hereditary kingdoms, as England, there are propely no *interregnums*. In elective kingdoms, the *interregnums* are extremely liable to factions and disorders. In Germany, the emperors have left the greatest part of their dominions during the *interregnums*.

INTERREX, a magistrate who governs during an *interregnum*, or in the interval between the death of a monarch and the election or inauguration of his successor.

This magistrate was established in old Rome, and was almost as ancient as the city itself. After the death of Romulus there was an *interregnum* of a year, during which the senators were each *interrex* in their turn, five days a-piece.

After the establishment of consuls, and a commonwealth, though there were no kings, yet the name and function of *interrex* were still preserved; for when the magistrates were absent, or when there was any irregularity in their election, or they had abdicated, so that the comitia could not be held, provided they were unwilling to create a dictator, they made an *interrex*, whose office and authority were to last five days; after which they made another. To the *interrex* was delegated all the regal and consular authority, and he performed all their functions. He assembled the senate, held comitia, or courts, and took care the election of magistrates was according to the *rules*. Indeed, at first it was not the custom of the *interrex* to hold comitia; at least we have no instance of it in the ancient Roman history.

The patricians alone had the right of electing an *interrex*. This office fell with the republic, when the emperors made themselves masters of every thing.

INTERRMENT, INTERMENT, or ENTERMENT, the act of *interring*, i. e. burying, or laying a deceased person in the ground. See BURIAL.

The excommunicated are not to be *interred* in holy, i. e. in consecrated ground. The ancients did not *inter* their dead; they burnt them, as the Indians do at this day. See BURNING.

The Abyssinians in lieu of *interring* their dead, shut them up in the bodies of trees, dug hollow for this purpose.

Gardeners also *inter*, or earth up, celery, endive, and lettuce, to blanch, or whiten, and make them the tenderer.

To *inter* wild stocks in ditches, is what Columella calls *deponere semina forebitos*. There are some trees, as willows, olives, &c. which grow very well, by *interring* their truncheons, i. e. cutting a truncheon, or piece, off at both ends, and planting it in the ground; which is what the Latins call *inhumare talea*, *talea*.

INTERROGATE, a judiciary act [illegible] or commissioner deputed to exa[illegible] who first gives his oath, that he will [illegible] thing he is *interrogated*.

INTERROGATION, *Erotesis*, a figure [illegible] which the passion of the speaker [illegible] way of question, to make its truth [illegible] The *interrogation* is a kind of apostrophe [illegible] speaker makes to himself; and it must be owned, that this figure is suited to express most passions and emotions of the mind; it serves also to press and bear down an adversary, and generally adds an uncommon briskness, action, force, and variety, to discourse.

INTERROGATION, in *Grammar*, is a point which serves to distinguish such parts of a discourse, where the author speaks as if he were asking questions. Its form is this (?)

INTERROGATORIES, in *Law*, are particular queſtions demanded of witneſſes brought in to be examined in a cauſe, eſpecially in the court of chancery. And theſe *interrogatories* muſt be exhibited by the parties in ſuit on each ſide; which are either direct for the party that produces them, or counter, on behalf of the adverſe party; and generally both plaintiff and defendant may exhibit, direct, and counter, or croſs *interrogatories*. They are to be pertinent, and only to the points neceſſary; and either drawn or peruſed by counſel, to be ſigned by them.

INTERRUPTION, in *Matters of Proportion*, denotes the ſame with *diſjunction*.

It is noted thus (::), and ſignifies the breaking off of the ratio in the middle of four diſjunct or diſcrete proportionals: as A : B :: C : D; that is, as A is to B ſo is C to D. See RATIO, PROPORTION, &c.

INTERRUPTION is alſo a figure in *Rhetoric*, wherein a perſon breaks off his diſcourſe ſuddenly, to ſhew ſome paſſion.

INTERSCENDENT, in *Algebra*, is applied to quantities, when the exponents of their powers are radical quantities. Thus $Z^{\sqrt{\ }}$, $z^{\sqrt{\ }}$, &c. are *interſcendent* quantities. See FUNCTION.

INTERSECTION, in *Mathematics*, the cutting of one line or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual *interſection* of two planes is a right line. The centre of a circle is in the *interſection* of two diameters. The central point of a regular or irregular figure of four ſides, is the point of *interſection* of the two diagonals. The equinoxes happen when the ſun is in the *interſections* of the equator and ecliptic.

INTERSEPTUM, a word uſed by ſome writers to expreſs the uvula, and by others the ſeptum narium.

INTERSOILING, in *Huſbandry*, the laying one kind of ſoil, or mould, upon another; as clay on ſand, ſand on earth, &c.

INTERSPERSUM *vacuum*. See VACUUM.

INTERSPINALES *colli*, in *Anatomy*, the name of five pair of ſmall muſcles diſcovered by Mr. Cowper; and by him ſo called, from their poſition along the ſpina.

They ariſe from each double proceſs of the ſpine of the neck, and run from the upper one to the next below, into which they are inſerted.

They ſerve to draw together the vertebræ of the neck; and are more eſpecially proper to this part, as having both their origin and inſertion in it.

INTERSPINALES *dorſi*, in *Anatomy*, a name given by Albinus to certain muſcles of the back, not mentioned by the old writers in anatomy, but called by Winſlow and other of the modern French writers, *les petis epineux du dos*; as the *interſpinales* lumborum of the ſame author, are the *epineux des lombes*.

INTERSPINALES *lumborum*, in *Anatomy*, a name given by Albinus to ſome muſcles not mentioned by the generality of writers, but called by Winſlow the *epineux des lombes*, or *ſpinales lumborum*.

INTERSTELLAR, a word uſed by ſome authors to expreſs thoſe parts of the univerſe that are without, and beyond, the limits of our ſolar ſyſtem.

In the *Interſtellar* regions are ſuppoſed to be ſeveral other ſyſtems of planets moving round the fixed ſtars, as the centres of their reſpective motions; and if it be true, as it is not improbable, that each fixed ſtar is thus a ſun to ſome habitable orbs, that move round it, the *interſtellar* world will be infinitely the greateſt part of the univerſe.

INTERTIES, or INTERTIRES, in *Architecture*, thoſe ſmall pieces of timber which lie horizontally betwixt the ſummers, or betwixt them and the ſell, or raiſing plate.

INTERTRANSVERSALES *colli*, certain muſcles between the tranſverſe proceſſes of the vertebræ of the neck; ſerving for divers motions of the head: of the ſame ſize and figure with the *interſpinales*, and obſerved by the ſame author. See Phil. Tranſ. N° 251. p. 131.

INTERTRANSVERSARII *dorſi*, in *Anatomy*, a name given by Albinus and others of the late anatomiſts, to certain ſmall muſcles of the back, not obſerved by the old writers on theſe ſubjects, but called by the French *les petis tranſverſoires du dos*.

INTERTRANSVERSARII *lumborum*, in *Anatomy*, a name given by Albinus to thoſe muſcles of the loins, which Douglas alſo calls the *intertranſverſales*, and Winſlow, with the other French writers, *tranſverſoires des lombes*.

INTERTWISTED *future*. See SUTURE.

INTERVAL, the diſtance or ſpace between two extremes, either in time or place.

The word comes from the Latin *intervallum*, which, according to Iſidore, ſignifies the ſpace *inter ſuſſum & murum*, between the ditch and the wall: others note, that the ſtakes or piles, driven into the ground in the ancient Roman bulwarks, were called *valla*, and the interſtices or vacancy between them *intervalla*.

Angle of INTERVAL. See ANGLE.

Lucid INTERVALS. See LUCID.

INTERVAL, in *Muſic*, the difference between two ſounds, in reſpect of acute and grave: or that imaginary ſpace terminated with two ſounds differing in acuteneſs or gravity.

When two or more ſounds are compared in this relation, they are either equal or unequal in the degree of tune: ſuch as are equal are called *uniſons*, with regard to each other, as having one tune; the other, being at a diſtance from each other, conſtitute what we call an *interval* in muſic; which is properly the diſtance in tune between two ſounds.

Intervals are diſtinguiſhed into *ſimple* and *compound*.

Simple INTERVAL is that without parts, or diviſion: ſuch are the octave, and all that are within it; as the ſecond, third, fourth, fifth, ſixth, and ſeventh, with their varieties.

Compound INTERVAL conſiſts of ſeveral leſſer *intervals*: ſuch are all thoſe greater than the octave; as the ninth, tenth, eleventh, twelfth, &c. with their varieties.

But this diſtinction, it is to be obſerved, regards practice only, becauſe there is really no ſuch thing as a leaſt *interval*. Beſides, by a *ſimple interval* is not meant here the leaſt practiſed, but ſuch as though it were equal to two or more leſſer, which are in uſe, yet when we would make a ſound move ſo far up or down, we always paſs immediately from one of its terms to the other.—What is meant then by a *compound interval*, will be very plain: it is ſuch, whoſe terms are in practice taken either in immediate ſucceſſion, or ſuch where the ſound is made to riſe and fall from the one to the other, by touching ſome intermediate degree; ſo that the whole becomes a compoſition of all the *intervals* from one extreme to the other.

What we here call a *ſimple interval*, the ancients called a *diaſtem*, and the *compound* they called a *ſyſtem*.

Each of theſe had its differences; even of the *ſimple* there are ſome greater, and others leſs: but they are always diſcord; but of the *compound* or *ſyſtem*, ſome are concord, others diſcord. Uniſons, it is plain, cannot poſſibly have any variety; for where there is no difference, as in uniſonance, which ſtems from a relation of equality, it is plain there can be no diſtinction: uniſons therefore muſt all be concords. But an *interval* depending on a difference of tune, or a relation of inequality, admits of variety; and ſo the terms of every *interval*, according to their particular relation or differences, make either concord or diſcord. Some indeed have reſtrained the word *concord* to *intervals*, making it include a difference in tune: but this is precarious; for as the word *concord* ſignifies an agreement of ſounds, it is certainly applicable to uniſon in the firſt degree. *Intervals*, it is plain, may differ in magnitude, and there may be an infinite variety, according to the poſſible degrees of tune; for there is no difference ſo great or ſo little, but a greater or a leſs may poſſibly be conceived. It is true, with regard to practice, there are limits, which are the greateſt and leaſt *intervals* our ears are judges of, and which may be actually produced by voice or inſtrument.

The degrees of tune are proportional to the number of vibrations of the ſonorous body in a given time, or the velocity of their courſes and recourſes.—Now theſe differences in tune conſtitute, as has been already ſaid, the *intervals* in muſic; theſe therefore muſt be greater or leſs, as the differences are; and it is the quantity of theſe, which is the ſubject of the mathematical part of muſic. Thoſe *intervals* are meaſured, not in the ſimple differences, or in arithmetical ratios of the numbers expreſſing the lengths or vibrations, but in the geometric ratios; ſo that the ſame *interval* depends on the ſame geometrical ratio, and *vice verſa*. It is, however, to be obſerved, that in comparing the equality of *intervals*, the ratios expreſſing them muſt be all of one ſpecies; otherwiſe this abſurdity will follow, that the ſame two ſounds may make different *intervals*.—To deſcribe the particular methods of meaſuring the inequality of *intervals*, would be too tedious: this one rule may be obſerved, that, to determine in general which of two or more *intervals* are the greateſt, take all the ratios in proper fractions, and the leaſt fraction will be the greateſt *interval*.

The ancients were extremely divided about the manner of meaſuring *intervals*.—Pythagoras and his followers meaſured them by the ratios of numbers. They ſuppoſed the differences of gravity and acuteneſs to depend on the different velocities of the motion which cauſes ſound; and therefore concluded, that they could only be accurately meaſured by the ratios of thoſe velocities. Which ratios are ſaid to have been firſt inveſtigated by Pythagoras, on occaſion of his paſſing by a ſmith's ſhop, and obſerving a concordance betwixt the ſounds of hammers ſtriking on the anvil.

Ariſtoxenus oppoſed this. He thought reaſon and mathematics had nothing to do in this caſe, and that ſenſe was the only judge in the diſpute; the other being too ſubtile

lubtile to be of any uſe. He therefore determined the octave, fifth, and fourth, which are the moſt ſimple concords, by the ear; and by the difference of the fourth and fifth, he found out the tone; which once ſettled as an *interval* the ear could judge of, he pretended to meaſure every *interval* by various additions, and ſubtractions made of theſe mentioned one with another: but this method is inaccurate.

Ptolemy keeps a middle courſe betwixt the two: he finds fault with the one for deſpiſing reaſon, and with the other for excluding ſenſe; and ſhews how theſe two may mutually aſſiſt each other in this matter. Malcolm.

Intervals are founded on certain ratios or proportions expreſſible in numbers, which may all be analyſed into the prime-numbers 2, 3, and 5. And all *intervals* may be found from the octave, fifth and third major, which reſpectively correſpond to thoſe numbers. Theſe are the muſicians elements, from the various combinations of which all the agreeable variety of relations of ſounds reſults.

This is the modern ſyſtem, and a late author aſſures us, it may be looked on as the ſtandard of truth; and that every *interval* that occurs in muſic is good or bad, as it approaches to, or deviates from what it ought to be, on theſe principles. He obſerves, that the doctrine of ſome of the ancients ſeems different. Ptolemy for inſtance, introduces not only the primes 2, 3, 4, 5, but alſo 7 and 11, &c. Nay, he ſeems to think all fourths good, provided their component *intervals* may be expreſſed by ſuperparticular ratios. But theſe are juſtly exploded conceits; and it ſeems not improbable that the contradictions of different numerical hypotheſes, even in the age of Ariſtoxenus, and their inconſiſtency with experience, might lead him to reject numbers altogether.—Dr. Pepuſch ap. Phil. Tranſ. N° 421. p. 267, 268.

Mr. Euler defines an *interval*, the meaſure of the difference of an acute and grave ſound. Tentam. Nov. Theor. Muſic. p. 72, and p. 103.

Suppoſe three ſounds *a*, *b*, *c*, of which *c* is the acute, *a* the moſt grave, and *b* the intermediate ſound. From the preceding definition it appears, that the *interval* between the ſounds *a* and *c*, is the aggregate of the *intervals* between *a* and *b*, and between *b* and *c*. Therefore if the *interval* between *a* and *b*, be equal to that between *b* and *c*, which happens when $a : b :: b : c$, the *interval* between *a* to *c* will be double the *interval* *a* to *b*, or *b* to *c*. This being conſidered, it will appear that *intervals* ought to be expreſſed by the meaſures of the ratios, conſtituting the ſounds forming thoſe *intervals*. But ratios are meaſured by the logarithms of fractions, the numerators of which denote the acute ſounds, and the denominators the grave. Hence the *interval* between the ſounds *a* and *b*, will be expreſſed by the logarithm of the fraction $\frac{b}{a}$ which is uſually denoted by $l\frac{b}{a}$, or, which comes to the ſame $lb - la$. The *interval* therefore of equal ſounds, *a* to *a*, will be null, as $la - la = 0$. The *interval* called an octave or diapaſon, will be expreſſed by the logarithm of 2; and the *interval* of the fifth or diapente will be $l3 - l2$. From whence it appears, that theſe *intervals* are incommenſurable; ſo that no *interval*, however ſmall, can be an aliquot part, both of the octave and fifth. The like may be ſaid of the *intervals* $l\frac{3}{2}$ and $l\frac{4}{3}$, and others whoſe logarithms are diſſimilar. But *intervals* expounded by logarithms of numbers, which are powers of the ſame root, may be compared.—Thus, the *interval* of the ſounds 27:8, will be to the *interval* of the ſounds 9:4, as 3 is to 2: For $l\frac{27}{8} = 3l\frac{9}{4}$, and $3l\frac{9}{4} = 2l1$. Euler, ibid. p. 74.

But though the logarithms of numbers, which are not powers of the ſame root, be incommenſurable, yet an approximating ratio of ſuch may be found. Thus the meaſure of the octave is $l2 = 0.3010300$, and the meaſure of the fifth is $l3 - l2 = 0.1760913$. Hence the *interval* of the octave will be to that of the fifth, nearly as 3010300 to 1760913; which ratio being reduced to ſmaller terms, in the method explained under the head RATIO, will give us theſe ſimpler expreſſions for the ratio of the octave and fifth, 2 : 1, 3 : 2, 5 : 3, 7 : 4, 12 : 7, 17 : 10, 29 : 17, 41 : 24, 53 : 31, which laſt is very near the truth. Euler, ibid. p. 75.

In like manner *intervals* may be divided into any number of equal parts; for this purpoſe we need only divide the logarithm of the propoſed *interval* into the ſame number of parts, and then find its correſpondent numbers by the tables. The ratio of the number ſo found, to unity, will give the required ratio of the divided *interval* to its propoſed part. Thus let the third part of an octave be required; its logarithm will be $= 0.1003433 = \frac{1}{3}l2$. The ratio correſponding nearly to this will be 63 : 50, or leſs accurately, 29 : 23, or 5 : 4, which laſt expreſſes the third major: and this is by the leſs knowing taken for the third part of an octave, and ſeems to be ſuch on our harpſichords and organs, where from C to E is a third, from E to G♯ another, and from G♯ or A♭ to *c* another third. But the more intelligent know, that G♯ and A♭ ought not to be reputed the ſame ſound, ſince they differ by a dieſis enharmonica, which is nearly equal to two commas.

Mr. Euler has inſerted a table of *intervals* in his Tentamen Novæ Theoriæ Muſicæ: he ſuppoſes the logarithm or meaſure of the octave to be 1.000000, whence the logarithm of the fifth will be 0.584962, and the logarithm of the third major will be 0.321928; from theſe the meaſures of all other *intervals* may be found. But as it has been cuſtomary for muſicians to meaſure their *intervals* by commas, we ſhall here inſert a table of *intervals* with their meaſures in commas; where we ſuppoſe the logarithm or meaſure of the comma $\frac{81}{80}$ to be 1.00000: hence the logarithm of the octave $\frac{2}{1}$ will be 55.79763, that of the fifth 31.63952, and laſtly that of the third major 17.96282. From theſe all the other *intervals* may be found in the manner expreſſed in the table; where the firſt column ſhews the names of the ſeveral *intervals*; the ſecond, the proportions of ſounds forming theſe *intervals*; the third, the compoſition of thoſe proportions from the primes 2, 3, and 5. The ſmaller figures marked above, and ſomewhat to the right of the larger, indicate the power to which the number expreſſed by the larger figures is raiſed. Thus $\frac{2^{17}3}{5}$ ſhews that the ſeventeenth power of two multiplied by 3, and divided by the eighth power of 5, will produce $\frac{393216}{390625}$ in the ſecond column, and that this is the proportion expreſſing the *interval* called *eſchaton* in the firſt column. The fourth column of the table contains ſome ſimple ſigns of ſome of the *intervals*, as *b* for *hyperoche*, *d* for *dieſis*, &c. and the fifth column ſhews how the *intervals* ariſe from others: [illegible] over-againſt ſemitone major, I find in the fourth column *S*, which is here only an arbitrary mark for this ſemitone; and in the fifth column I find $1 + d = IV - III$, which ſignifies that the ſemitone major is equal to the ſum of the ſemitone minor and dieſis, or to the difference between the fourth and third major. Obſerve, that the comma is marked by a dot (.); when this is placed over the letter or other ſymbol, it ſignifies that the *interval* is ſuppoſed to be heightened by a comma; and on the contrary, when the point is placed below, it ſignifies that the *interval* muſt be diminiſhed by a comma. Thus $t = \dot{T}$ ſignifies that the tone-minor increaſed by a comma is equal to a tone major, and vice verſa, $\dot{T} = t$ ſhews that the tone-major diminiſhed by a comma is equal to the tone-minor. The ſigns +, −, =, are here taken in the ſame ſenſe as in algebra, to ſignify addition, ſubſtraction, and equality. So likewiſe the dot placed between two numbers, or between a number and the ſymbol of an *interval*, ſignifies that the *interval* is to be multiplied by the number. Thus 2. IV ſhews that the fourth is doubled; and thus $7^8 = VI + 8 = 2.IV = VIII - T$, ſhews that the leſſer flat ſeventh is equal to the ſixth major and ſemitone-major, or alſo to two fourths, or to the octave when the tone-major has been taken from it. Laſtly, the ſixth column of the table ſhews the meaſures, or logarithms of the ratios in the ſecond column. Theſe are not the common logarithms of the tables where 1.000000 is the logarithm of 10. 81. But here 1.00000 is aſſumed as the [illegible] of $\frac{81}{80}$ or of the comma, as before [illegible] logarithms are eaſily derived fr[illegible] larger tables of Vlacq, or Briggs[illegible] of 2, or the octave = 0.3010299[illegible] $\frac{3}{2}$, or of the fifth = 0.1760912[illegible] rith of $\frac{4}{3}$, or of the third major = 0[illegible] theſe logarithms being ſeverally divi[illegible] of $\frac{81}{80}$, or of the comma = 0.0052995[illegible] quotients will give the number of commas in an octave = 55.79763; in a fifth = 31.63952; and in a third major = 17.96282. Hence all the reſt may be found by addition and ſubſtraction only. Here follows the Table.

A TABLE of the Muſical *Intervals*, with their Meaſures.

Names of the *Intervals*.	Proportions expreſſing the *Intervals*.	Compoſition of the proportions from 2, 3, and 5.	Simple Signs.	Complex ſigns to ſhew the Compoſition of *Intervals*.	Meaſures by Commas.
Eſchaton	393216 / 390625	$2^{17}/5^8$		$t-b=2d-c=3^5-S$	0.53222
Diaſchiſma	2048 / 2025	$2^{11}/3^4 5^2$		f	0.90917
Comma	81 / 80	$3^4/2^4 5$		$T-t$	1.00000
Comma of Pythagoras	531441 / 524288	$3^{12}/2^{19}$		$6T-VIII$	1.09083
Hypercroche	3125 / 3072	$5^5/2^{10}3$	b	$t-d=S-2d$	1.37695
Enharmonic Dieſis, or diminiſhed ſecond	128 / 125	$2^7/5^3$	d	$S-t$	1.90917
Semi-tone Minor, or leaſt Chromatic Dieſis	25 / 24	$5^2/2^3 3$	s	$t-S=d+b=III-3^b$	3.28612
Limma of the Greek ſcale, or deficient Semi-tone Major	256 / 243	$2^8/3^5$		$S=IV-2t$	4.19529
Leſſer Limma, or redundant Semi-tone Minor	135 / 128	$3^3 5/2^7$		$s=T-S$	4.28612
Semi-tone Major	16 / 15	$2^4/3.5$	S	$s+d=IV-III$	5.19529
Apotome of the Greek ſcale	2187 / 2048	$3^7/2^{11}$		$T-S=s$	5.28612
Greater Limma, or redundant Semi-tone Major	27 / 25	$3^3/5^2$		$S=T-s$	6.19529
Double Semi-tone Minor	625 / 576	$5^4/2^6 3^2$		$2s=t-d$	6.57224
Greateſt Limma, or redundant double Semi-tone Minor	1125 / 1024	$3^2 5^3/2^{10}$		$s+s=T-d$	7.57224
Tone Minor	10 / 9	$2.5/3^2$	t	$S+s=T=IV-3^3=III-T$	8.48141
Tone Major	9 / 8	$3^2/2^3$	T	$t=V-IV$	9.48141
Diminiſhed Third	256 / 225	$2^8/3^2 5^2$		$s+d=2S$	10.39058
	144 / 125	$2^4 3^2/5^3$		$T+d=3^3-s$	11.39058
Superfluous Second	135 / 128	$3^3 5/2^7$		$s+t$	11.76753
	108 / 75	$2^2 3^3/3.5^2$		$T+t=3^3-d$	12.76753
Trihemitone of the Greek Scale, or deficient Third Minor	64 / 32	$2^6/2^5$		$s=t+S=IV-T$	13.67670
Third Minor	27 / 6	$3^3/2.3$	3^b	$T+S=V-III$	14.67670
Trihemitone Major	5 / 4096	$5/2^{12}$		$3S=T+S+d$	15.58587
Extreme diminiſhed Fourth	3375 / 768	$3^3 5^3/2^8 3$		$3^b+d=IV-2t$	16.58587
Third Major	625 / 512	$5^4/2^9$	III	$III=V-3^b$	17.96282
Ditonus of the Greek Scale, or redundant third Major	81 / 64	$3^4/2^6$		$III=2T$	18.96282
Diminiſhed Fourth	32 / 25	$2^5/5^2$		$III+d=IV-s$	19.87199
Superfluous Third	125 / 96	$5^3/2^5 3$		$III+s$	21.24894
Fourth	4 / 3	$2^2/3$	IV	$III+S=VIII-V$	23.15811
Redundant Fourth	27 / 20	$3^3/2^2 5$		$IV=3^3+T$	24.15811
Superfluous Fourth	25 / 18	$5^2/2.3^2$		$IV+s$	26.44423
Semidiapente of the Greek Scale	1024 / 729	$2^{10}/3^6$		$IV+S$	27.35340
Tritonus, or falſe Fourth	45 / 32	$3^2 5/2^5$		$IV+s=V-S$	27.44423
Semidiapente, or falſe Fifth	64 / 45	$2^6/3^2 5$		$IV+S=V-s$	28.35340
Tritonus of the Greek Scale	723 / 512	$3^6/2^9$		$3T=V-S=IV+s$	28.44423
Diminiſhed Fifth	36 / 25	$2^2 3^2/5^2$		$V-s=2.3^3$	29.35340
Deficient Fifth	40 / 27	$2^3 5/3^3$		$V=IV+s$	31.63952
Fifth	3 / 2	$3/2$	V	$IV+T=III+3^3$	32.63952

Names of the *Intervals*.	Proportions expreſſing the *Intervals*.	Compoſition of the proportions from 2, 3, and 5.	Simple Signs.	Complex ſigns to ſhew the Compoſition of *Intervals*.	Meaſures by Commas.
Superfluous Fifth	25/16	5²/2⁴		V+*i*=2.III.	35.92564
Sixth Minor	8/5	2³/5	6♭	V+S=VIII−III	37.83481
Sixth Major	5/3	5/3	VI	V+*i*=VIII−3♭	41.12093
	3	3		VI=V+T=VIII−3♭	42.12093
Hexachord of the Greek Scale, or redundant Sixth Major	27/16	3³/2⁴		6♭+S=2.IV−*i*=7♭−*s*	43.03010
	128/27	2⁷/3³		6♭+S=7♭−*s*	44.63010
Leſſer diminiſhed Seventh	75/128	3.5²/2⁷		VI+*s*	44.40705
Greater diminiſhed Seventh	225/128	3².5²/2⁷		V+*i*=VIII−2S	45.40705
Leſſer ſuperfluous Sixth	72/125	2³.3²/5³		VI+S=2.IV=VIII−T	46.31622

Diminiſhed Octave	48/25	2⁴.3/5²		VIII=V+IV	55.79763
Superfluous Seventh	125/64	5³/2⁶			
Octave	2/1	2	VIII		

The limma, apotome, tribemitone, ditonus, ſemidiapente, and tritonus, mentioned in this table, by the names of limma, apotome, &c. of the Greek ſcale, are ſuch as are either mentioned by the ancients, or at leaſt occur in their ſcale, where fourths are divided into two tones and a limma, and where the octave conſiſted of five tones and two limmas.

The term *redundant*, in the table, is applied to ſuch *intervals* as exceed the truth by a comma; and ſuch as fall ſhort of the truth by a like quantity, are called *deficient*. *Intervals* that exceed true diatonic *intervals*, by a ſemitone-minor, are ſaid to be *ſuperfluous*; and thoſe which fall ſhort by the ſame quantity are ſaid to be *diminiſhed*. Where an *interval* exceeds a true diatonic *interval* by the quantity of two ſemitones minor, we have called it an *extreme ſuperfluous interval*: And if it falls ſhort by the ſame quantity the appellation of *extreme diminiſhed interval* is given it. Thus, if from A to D aſcending be a true fourth, and from D to *a* a true fifth, then, if D be ſuppoſed raiſed by a comma, from A to D will be a redundant fourth, and from D to *a* a deficient fifth. From A to D ♯ will be a ſuperfluous fourth, and from D ♯ to *a* will be a diminiſhed fifth. In like manner, from A to D♭, will be a diminiſhed fourth; and from D♭ to *a* a ſuperfluous fifth. From A to D ♯♯ (D double ſharp) will be an extreme ſuperfluous fourth, and from A to D♭♭ (D double flat) will be an extreme diminiſhed fourth. In like manner from D ♯♯ to *a* will be an extreme diminiſhed and from D♭♭ to *a*, an extreme ſuperfluous fifth. Such *intervals* are not to be met with in the practice of muſic; but if the diviſion of the octave into 31 parts were once eſtabliſhed, as it ought for the perfection of muſic, ſuch *intervals* as theſe here mentioned will neceſſarily occur in the ſcale. Vide Phil. Tranſ. N° 481. p. 273, 274. See GENUS.

This table, among other uſes, will facilitate the examination of any propoſed ſcale, or *interval*. Suppoſe, for inſtance, it were required to examine ſome of Ptolemy's diviſions of the fourth, as his diatunicum molle, which he makes 5+12+21=38. Take the logarithm of $\frac{4}{3}$ from the common tables and diviſe it by the logarithm of $\frac{38}{31}$, the quotient will be 10.75, which gives the meaſure or number of commas, and its parts contained in an *interval* expreſſed by $\frac{38}{31}$. Look for the neareſt meaſure of *intervals* to 10.75 in the table, it will be found to be 10.79058, which anſwers to the *interval* of two ſemitones major, or of the diminiſhed third, as practitioners call it. But Ptolemy's exceeds this by 0.36, or about $\frac{1}{3}$ of a comma. The next *interval* in Ptolemy's diviſion is $\frac{43}{38}$, which is a true tone-minor. The third is $\frac{31}{27}$, which will be found to be 3.93 commas, that is a ſemi-tone minor and 0.64 of a comma, or a ſemi-tone minor redundant by near $\frac{2}{3}$ of a comma. But this is much out of tune. In the common, and in Huygens's temperatures, the ſemitone minor is increaſed only by about $\frac{1}{3}$ of a comma. Vide Ptolemy's Harmon. p. 92. apud Wallis Opera, tom. v.

Concinnous INTERVALS, in *Muſic*. Diſcords are diſtinguiſhed into *concinnous* and *inconcinnous intervals*: the *concinnous* are ſuch as are fit for muſic, next to, and in combination with concords; being neither very agreeable nor diſagreeable in themſelves; but having a good effect, as by their oppoſition they heighten the more eſſential principles of pleaſure; or as by their mixture and combination with them, they produce a variety neceſſary to our being better pleaſed.

The other diſcords that are never uſed in muſic, are called *inconcinnous*.

INTERVAL, *Diminiſhed*, in *Muſic*, is a defective *interval* or an interval which is ſhort of its juſt quantity by a leſſer ſemitone. Thus from C ♮ to E being a third minor, if E be lowered by a ſemi-tone minor, we ſhall have E b, and then from C ♮ to E b is called a *diminiſhed* third, in the language of practical muſicians, and occurs frequently in their works. But ſtrictly ſpeaking, in this caſe, the note E muſt be lowered more than a ſemi-tone minor.

INTERVAL, *Harmonical*, in *Muſic*, is an *interval*, or difference of two ſounds which are agreeable to the ear, whether in conſonance or ſucceſſion.

Harmonical Intervals, therefore, are the ſame with *concords*. They are thus called, as being the only eſſential ingredients of harmony.

INTERVALS, in the *New Method of Huſbandry*, denote the wide ſpaces, commonly about five feet, which are left between any two of the double, treble or quadruple rows. See HUSBANDRY.

INTERVALS, in the *Military Art*, are the ſpaces left between each regiment in CAMP, and likewiſe between each tent.

INTERVERTEBRALES *Muſculi*, are muſcles [illegible] from the body of one vertebra laterally, and aſcending, after an oblique progreſs, into the back part of the next vertebra, immediately above it. They draw the vertebræ nearer to one another, and a little to one ſide.

INTESTATE, a perſon who dies without making a will.

An heir *ab inteſtato*, is a perſon who inherits an eſtate by ſome other right, than that of will or teſtament.

Heretofore, thoſe who died *inteſtate*, were held infamous, and accuſed; in regard, by the canons of ſeveral councils, every perſon was injoined to bequeath a part of his eſtate (and Matthew Paris ſays it was at leaſt to be a tenth part) to the church, for the ſafety of his ſoul; which a perſon who neglected to make a will, and to leave this legacy to the church, was judged to have

abandoned.—Several councils took on them to command the priests to ſolicit dying perſons to be charitable to the church; and this they did ſo earneſtly, that abſolution and the viaticum were denied to thoſe whom they could not prevail on; ſo that they made no difference between theſe *inteſtates* and ſelf-murderers; and they were alike denied Chriſtian burial.—Du-Cange adds, that all who died without abſolution, without receiving the viaticum, and without leaving alms to the church (even though they died ſuddenly), had their effects ſeized, and confiſcated to the uſe of the church, biſhop, *&c.*

In the Engliſh law there are two kinds of *inteſtates*: the one *de facto*, which are thoſe who make no will at all; the other *de jure*, called alſo *quaſi inteſtati*, which are thoſe who make a will; but ſuch an one as is null and void, either from the executors refuſing to act, or from ſome other cauſe: in which caſe they are judged to die as *inteſtate*, *quaſi inteſtati*.

And the 22 and 23 Car. II. c. 10. commonly called the ſtatute of diſtribution, appoints a diſtribution of *inteſtates'* eſtates, after debts and funeral expences are paid, among the wife and children of the deceaſed; or for want of ſuch, among the next of kin, &c. and the act of parliament doth immediately upon the death of the *inteſtate* veſt an intereſt in the perſons entitled: ſo that if any one dies before the diſtribution, though within the year, his ſhare ſhall go to his executors and adminiſtrators; and not to the ſurviours or next of kin to the *inteſtate*. 1 Lil. Abr. 487. See ADMINISTRATION. The brothers and ſiſters of the *inteſtate* ſhall have equal ſhares with the mother. 1 Jac. II. c. 17. See CUSTOM *of* LONDON. By the ſame ſtatute it is enacted, that one third part of the ſurpluſage of the eſtate of any perſon dying *inteſtate*, ſhall be diſtributed to his wife, and the reſidue amongſt his children by equal portions, or amongſt ſuch perſons as legally repreſent his children, in caſe any of them be then dead, excepting ſuch child or children (not being heir at law) who ſhall have any eſtate by the ſettlement of the *inteſtate*, or ſhall be advanced by the *inteſtate* in his life-time, by portion or portions equal to the ſhare which ſhall by ſuch diſtribution be allotted to the other children, and in caſe their portions have not been equal, they ſhall be made ſo as nearly as poſſible out of the ſaid ſurpluſage. But the heir at law is to have an equal part in the diſtribution with the reſt of the children, without any conſideration of the value of the land which he hath by deſcent or otherwiſe from the *inteſtate*. In caſe there be no children nor legal repreſentatives, one moiety of the ſaid eſtate ſhall be allotted to the wife of the *inteſtate*, and the reſidue diſtributed equally to every of the next kindred of the *inteſtate*, who are in equal degree, and thoſe who legally repreſent them; provided that there be no repreſentations admitted among collaterals, after brothers and ſiſters children: and if there be no wife, the ſaid eſtate ſhall be wholly diſtributed in equal ſhares among the children; or if there be no child, to the next of kindred in equal degree, and their legal repreſentatives. But no ſuch diſtribution of the goods of an *inteſtate* ſhould be made till after one year be fully expired after his death, and thoſe to whom diſtribution is made, are required to give bonds with ſufficient ſureties, to refund in caſe of debts.

INTESTINA, in the *Linnæan Syſtem*, a genus of worms; the characters of which are that they are ſimple naked animals without limbs: ſome are pierced with a lateral hole or a kind of pore; and others are imperforated and have no lateral pore. The ſubordinate genera of this diviſion of worms are the *gordius*, *aſcaris*, *lumbricus*, *faſciola*, *ſpanculus*, *hirudo*, and *myxine*, comprehending twenty-four different ſpecies deſcribed by Linnæus. Syſtem. Nat. tom. i. pars 2. p. 1075, &c. Ed. 1767.

INTESTINE *motion*. See MOTION.

INTESTINE *war*. See WAR.

INTESTINES, INTESTINA, in *anatomy*, the *guts* or *bowels*; thoſe hollow membranous, cylindrical parts, extended from the right orifice of the ſtomach to the anus; by which the chyle is conveyed to the lacteals, and the excrements are voided.

The *inteſtines* ſeem to be nothing but a continuation of the ſtomach; as conſiſting of the ſame number of coats, and fabricated in the ſame manner; they are protended with various circumvolutions and inflexions to the anus, through which they diſcharge the excrementitious parts of their contents out of the body.

They are, when ſeparated from the meſentery, to which they are all along connected, of a very great length; ordinarily about ſix or ſeven times as long as the perſon's height whoſe they were. And though they ſeem to be but one continued channel or fiſtula, yet becauſe in ſeveral parts their magnitude, figure, and thickneſs, are different, they are in general divided into the *thick* and *ſmall*; and theſe are again each of them ſubdivided into three; the three ſmall are called *duodenum*, *jejunum*, and *ileum*; and the thick, *cæcum*, *colon*, and *rectum*. They have all of them, in common, a kind of vermicular motion, which, beginning at the ſtomach, is propagated downwards, and is called the *periſtaltic motion*. To facilitate that, they are generally lubricated with a great deal of fat, eſpecially the thick ones, whoſe ſurface being ſomewhat more uneven, and the contents leſs fluid than thoſe of the ſmall, they need ſomewhat more to make them ſlide eaſy.—See *Tab. Anat. (Splanch.) Fig.* 3. *lit. nn*, *Fig.* 6. *lit. a*, *b*, *i*, *Fig.* 7. *d*, *e*. See PERISTALTIC.

INTESTINA *tenuia*, *the ſmall guts*.—The firſt is called *duodenum*, and reaches from the right orifice of the ſtomach, as far as the vertebræ of the back on the left-ſide, where, at the firſt angle made by the *inteſtines*, it ends; which is about twelve inches; from which meaſure it ſeems to have taken its name. This meaſure, however, is far from being very exact, as being much too largely computed. Into this gut the gall-duct and pancreatic duct empty themſelves, and their ſeveral liquors here mix with the chyle. See DUODENUM.

The next *inteſtine* to the *jejunum*, ſo called, becauſe it is generally found more empty than the reſt; which may be occaſioned partly by the fluidity of the chyle, which is greater in this *inteſtine* than in any of thoſe that follow it; and partly by its capacity, being ſomewhat larger than that of the duodenum, and therefore it gives a freer paſſage; and perhaps alſo the irritation of this gut through the acrimony of the bile, which is diſcharged into the *inteſtinet* a little before the beginning of this gut, may contribute ſomething towards accelerating the paſſage of the contents. However, it may ſeem ſufficient, that through the great number of lacteals, with which this gut abounds more than any other, the deſcent of the contents, which are here deprived of their moſt fluid parts, ſhould in the reſt be more ſluggiſh, by reaſon of their great conſiſtence,—This *inteſtine* is allowed to poſſeſs almoſt the whole umbilical region, and its length is generally computed to be about twelve or thirteen hands breadth.

The *ileum*, which is the third *inteſtine*, is ſituated below the navel, and fills the ilia with numerous folds and convolutions.—It is much the longeſt of all the *inteſtines*, being eſteemed to be one-and-twenty hands long: but theſe eſtimates are ſomewhat arbitrary, becauſe it is not exactly ſettled among anatomiſts, where the jejunum ends, or the ileum begins; neither is it eaſy or neceſſary to do it.—In both this and the preceding *inteſtine*, the inner tunic is much corrugated, the looſe folds of which have been thought to do, in ſome meaſure, the office of valves, and have therefore by authors been called *valvulæ conniventes*; which are framed, as in the ſtomach, only by the inner coat being larger than the outward.

INTESTINA *craſſa*, *the thick guts*.—The firſt is called the COECUM, which has a lateral inſertion into the upper end of the colon; and is not perforated at its other extremity, but hangs to it like the finger of a glove; and is about three or four inches long. The true uſe of this part is not yet determined, and ſome late anatomiſts have thought, that the name likewiſe is miſtaken, not allowing this to be the *cæcum* of the ancients, which they imagined to be that thick globous part of the colon, which is immediately appended to the ileum; and therefore they have given this part the name of *appendicula vermiformis*. This cæcum, or appendix, is proportionably bigger in infants than in adults, and in many other animals even ſmaller than in men; and is, at the unperforated extremity, ſlightly connected to the right kidney.

The next of the thick *inteſtines* is the COLON, which is much the largeſt and moſt capacious of them all. It has a great many cellulæ, or, as it were, diſtinct cavities, framed by a coarctation of the gut by two ligaments, or bundles of membranous fleſhy fibres, about half a finger broad, each running on either ſide the gut oppoſite to each other, the whole length of it; and as it were girding it in at certain diſtances, thereby making it reſemble a glaſs incorporator, uſed in mixing oil and vinegar.—The laſt of the *inteſtines* is the *rectum*, which reaches from the os ſacrum to the anus, and is plain, without cells. It is faſt tied to the os ſacrum and os coccygis, by means of the peritonæum, and in men to the neck of the bladder of urine, in women to the vagina uteri, to which it is ſo ſtrongly connected by a membranous ſubſtance, that the ſubſtance of the vagina and *inteſtine* are hardly diſtinguiſhable from one another. The length of this gut is ordinarily about a hand's breadth and a half, and its capacity about the thickneſs of three fingers; its lower end, the anus, is furniſhed with three muſcles, viz. the *ſphincter ani*, and two *levatores ani*, which ſee.

There are alſo in the *inteſtines* a great number of glands, which in the *inteſtina tenuia*, are gathered together in heaps,

heaps, as it were like bunches of grapes. In these *intestines* they are very small, and were it not for their concerva-tions, would be scarce visible. But in the *intestina crassa* they are much larger, not gathered like the others, but dispersed; and though very numerous, they come under the denomination of *solitary glands*. The glands discharge a liquor into the *intestines*, whether ordinarily for any thing more than the lubrication of the *intestines*, and diluting their contents, is not certain; though through these seems the greatest part of the discharge to be made, which, either upon extraordinary fluxes, or upon the administration of cathartics, we have frequent occasions to observe.

The *intestines*, in general, are furnished with blood from the mesenteric arteries, which is returned by the mesenteric veins; but the duodenum receives a branch of an artery from the cœliac, which is called the *duodenal*; to which answers a vein of the same name that likewise returns the blood to the porta; the rectum receives others, which are called *hæmorrhoids*; the internal from the inferior mesenteric, and the external from the hypogastric, with veins corresponding of the same name, that also go to the porta. These vessels spread the *intestines* with abundance of ramifications, and are frequently diversified in several subjects of the same species; much less are they to be depended upon for an uniform appearance in animals of different kinds. The nerves of the *intestines* come some of them from those of the stomach, and some from the great mesenteric plexus, which distributes branches to all the *intestines*. The remaining vessels of the *intestines* are the lymphæducts and venæ lacteæ.

The use of the smaller guts is to promote the formation of the chyle, to perfect its secretions, and to propel the remaining faces to the larger. The office of the larger guts is to receive and collect the matter of the faces, and at a proper time to expel it. See Miscellaneous Remarks on the *Intestines*, by Dr. Monro. Edinb. Ess. vol. iv. art. 12.

INTESTINES, *Wounds of the.* When a large wound is made in the cavity of the abdomen which not only lets out the *intestines*, but also divides some part of them, the wounded part of the intestines is always to be stitched up before they are returned, by which means the wound heals the more readily; and the discharge of the chyle and faeces into the cavity of the abdomen is prevented, from which dangerous symptoms would otherwise have ensued. And although wounds of the *intestines*, especially of the small gute, admit of little or no hopes of a cure; yet as the great guts sometimes admit of the future with advantage, it is better to use a doubtful remedy than none. Small wounds of the intestines, however, or such as do not exceed the diameter of a goose-quill, are by no means to be stitched, but left to nature; by which means there is much greater hope of success than from irritating them with the future; but large wounds of the *intestines* though they seldom admit of cure, yet this is always to be attempted by means of the glover's future, before the *intestine* is returned. To perform this, you are to be provided with a small needle threaded with silk; an assistant should take hold of one part of the gut by a fine piece of linen well aired, while the surgeon should hold the other part in his left-hand, and sew up the whole wound after the glover's manner, leaving very small spaces, not more than the twelfth of an inch between each of the stitches. The last stitch in this operation must be fastened with a knot, but the other end must hang about a foot out of the abdomen, by means of which the silk may be drawn out when the *intestine* is healed. After this is performed the wound of the abdomen is next to be taken care of, and stitched up, keeping the lower or depending part of the wound open with a tent, till all the preternatural fluids are discharged out of the cavity of the abdomen, and till the union of the wound in the *intestine* shall give leave to draw away the silk with which the future was performed on it.

As the modern surgeons, however, have found that few are saved who have received any large wound in the *intestines*, and that in those few who do recover, the wounded parts from the fineness of the coat of the gut do not properly unite, but rather adhere to the inner part of the peritoneum, or to the omentum, or to some other of the *intestines*, they rather choose now to let alone the operation of the future of the gut, and substitute a gentler method of cure. They pass a waxed thread through a fine needle, and with this they fasten the wounded part of the *intestine* to the internal orifice of the wound in the abdomen. The thread that is this case hangs out of the abdomen, is to be firmly fixed by the application of sticking plasters to the wound, that the *intestine* cannot recede from that part to which it is fastened, nor can it evacuate any of its contents into the cavity of the abdomen. When this operation is well performed, the *intestine* easily adheres to the internal part of the abdomen, and the patient suffers infinitely less pain and hazard than from the former way of making the future. The same method of cure also is the proper one for wounds of the stomach, when they are within the reach of the hand, and it is sometimes crowned with success. Heister's Surgery, p. 56. See GASTRORAPHY.

Loss of substance in the INTESTINES. Where any part of the *intestines* is carried away, the case is plainly desperate, and it is indeed wonderful that persons thus wounded have not all died upon the spot, or in the operation of making the future, till some of the late eminent surgeons observed that the lips of the *intestines* so wounded, would sometimes unexpectedly adhere to the wound in the abdomen, and took this hint from nature towards a cure in such desperate cases. Whenever a surgeon therefore is called in a case of this kind, after diligently examining the state of the upper part of the *intestine* which has suffered the loss of substance, he should stitch it to the external wound; for by this means the patient may not only be saved from instant death, but there have been instances where the wounded *intestine* has been so far healed that the faeces which used to be voided by the anus, have been voided by the wound in the abdomen. And this though from the necessity of wearing a tin or silver pipe, or keeping cloths constantly upon the part to receive the excrement, may seem to be very troublesome; yet it is surely far better to part with one of the conveniencies of life than to part with life itself: besides the excrements that are voided by this passage, are not so offensive in smell as those voided per anum.

The same method of cure may conveniently also be put in practice, where any part of the *intestine* is mortified, by having been thrust out of the abdomen; for in this case if you tie up the mesenteric arteries, the corrupted or mortified part of the *intestine* may be cut off, and the remaining sound part made to adhere to the wound of the abdomen. And it is surely better to try this method and save if it be only a few by it, than to leave all in this unhappy situation to perish without help. Heister. p. 69.

We have instances of mortified pieces of the *intestines* in the HERNIA cut away, and a cure made by keeping the extremities of the gut near to each other, and near to the rings of the muscles, with a stitch through the mesentery. The ends of the *intestines* grew to the peritoneum, new flesh was extended along this membrane, and joined the extremities together. The soldered part of the gut is always straightened, and therefore those who are cured in this case ought to guard against too full meals and indigestion. See Memoires de l'Academie de Chirurg. tom. i.

INTESTINES, *Falling out of the.* See HERNIA.

INTESTINES, *Inflammation of the.* See ILIAC *Passion*.

INTESTINES *of fish.* The guts in fishes are very different in the several kinds in length, proportion, and figure; in some fish the *intestine* is straight and simple, and is carried directly from the stomach to the anus, as in the conger, syngnathus and petromyzon; in others it is only once returned upward, as in the cyprini, salmons, pearch, and many others. In others it is variously contorted and revoluted, in the same manner as in land animals: we have instances of this in the sparus, dolphin, mullet, and sword-fish.

In length there are many very eminent differences. In the petromyza, &c. the whole *intestinal* canal is not so long as the body of the fish. In the cyprini of many kinds it is about the same length with the body of the fish; and in others it is greatly longer, as in the spari, mullets, *&c.*

INTESTINAL *Fever.* See FEVER.

INTESTINAL *to Sphincter*, in *Anatomy*, a name given by Winslow to a muscle of the anus, called by Albinus *sphincter internus ani*. It is called by Riolan, and others, *sphincter cutaneus*, and *sphincter superficialis*.

INTESTINUM *cæcum*. The fish kinds have in general a great number of these *cæca*; they are called by the ichthyologists *intestinula cæca*, and *appendices pylori*. They are always placed about the pylorus, and the beginning of the *intestinal* canal, and seem by their number and appearance to contribute not a little to the digestion of food. They are very different in the several kinds of fish, in number, figure, and proportion. In some fish there are none of them. The cetaceous fishes in general are without them, and the cartilaginous of many kinds also want them. In the ammodytes or sand-eel there is only one *cæcum*, and this seems the only fish that has it single. In many of the pleuronecti they are two in number, and very short. The pearch, spari, *&c.* have five, six, or seven of them, and all considerably large ones. In some fish there are eight, ten, or twelve of them, as in the cotti, and some of the ligyri. In the herring and anchovy there

there are ſeventeen or eighteen of them. Some, but not many fiſh, have twenty or more, not arriving at thirty. The gadi, and ſome other fiſh have thirty; and the corregones and ſalmons, at leaſt ſixty of them. The clupea or thriſſa of authors has at leaſt eighty of them; and the ſword-fiſh, the tunny, the mackrel, and many others have more than an hundred of them, or have them indeed without number. Their differences in figure are alſo very great. In ſome fiſh they are long and narrow, as in the ſalmons, gadi, and clupeæ. In others, they are very ſhort and thick, as in the pleuronecti, and oſmeri. In the greateſt part of fiſhes they are much ſmaller than the reſt of the guts; but in the mullet and ſand-eel, they are nearly as large as the *inteſtine* itſelf. It is remarkable, that theſe appendices to the pylorus, or *inteſtini*, are not only found in fiſhes, but in ſome inſects. Dr. Tyſon found three or four of them in that ſpecies of inſect called the *blatta*.

INTIRE *Tenancy*. See ENTIRE *Tenancy*.

INTRADA, in the *Italian Muſic*, is uſed to denote an *entry*, and is much the ſame as *prelude* or *overture*.

INTRANSITIVE *Verbs*, in *Grammar*, ſuch whoſe action does not (*tranſire*) paſs on an object, or ſubject. See VERB *Neuter*.

INTRENCHMENT, *in the Art of War*, all ſorts of works made to fortify a poſt againſt an enemy. See RETRENCHMENT.

They uſually conſiſt only of a bank of earth and a ditch, and are of two ſorts; ſuch as the trenches carried on in a ſiege, where the bank is between the ditch and the enemy or town; and where the earth is thrown up againſt the town; and ſuch as ſerve to incloſe a town or camp, ſecure a paſs, cover the entrance into a country or other places, &c. In theſe the ditch is between the bank and the enemy. The firſt ſort are uſually called TRENCHES or APPROACHES; and the ſecond are generally called LINES.

It was a maxim amongſt the Romans, that even in their moſt haſty marches they *intrenched* every night.

INTRIGUE, or INTRIGUE, an aſſemblage of events, or circumſtances occurring in an affair, and perplexing the perſons concerned in it.

The word is French, *intrigue*, formed from the Latin *intricare*; which, according to Nonius, comes from *trica, entanglements*; and that from the Greek τριχες, *hairs*: *quod pilis gallinaceis involvuntur & impedimur capilli*. Which conjecture is adopted by Tripaud, who will have the word *intrigue* to be primarily and properly underſtood of chickens, which have the feet entangled in hair; and to be derived from the Greek θρ, and θριξ, *hair*.

INTRIGUE is more particularly uſed to ſignify the plot of a play, or romance; or that point wherein the principal characters are the moſt embarraſſed, through the artifice and oppoſition of certain perſons, or the unfortunate falling out of certain accidents and circumſtances.

In a tragedy, comedy, or epic poem, there are always two deſigns; the firſt and principal is that of the hero of the piece; the ſecond contains the deſigns of all thoſe who oppoſe him. Theſe oppoſite cauſes produce oppoſite effects, to wit, the efforts of the hero for the execution of his deſign, and the efforts of thoſe who thwart it. As thoſe cauſes and deſigns are the beginning of the action, ſo thoſe efforts are in the middle, and there form a knot or difficulty, which we call an *intrigue*, that makes the greateſt part of the poem. It laſts as long as the mind of the reader or hearer is ſuſpended about the event of thoſe oppoſite efforts: the ſolution or cataſtrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The *intrigue* or plot of the Iliad is two-fold, the firſt comprehends the three days fighting in Achilles's abſence, and conſiſts, on the one ſide, in the reſiſtance of Agamemnon and the Greeks, and on the other, in the inexorable temper of Achilles. The death of Patroclus unravels this *intrigue*, and makes the beginning of a ſecond. Achilles, reſolves to be revenged, but Hector oppoſes his deſign; and this forms the ſecond *intrigue*, which is the laſt day's battle.

In the Æneid there are alſo two *intrigues*: the firſt is taken up in the voyage and landing of Æneas in Italy; the ſecond in his eſtabliſhment there. The oppoſition he met with from Juno, in both theſe undertakings, forms the *intrigue*.

As to the choice of the *intrigue*, and the manner of unravelling it, it is certain they ought both to ſpring naturally from the ground and ſubject of the poem.—Boſſu gives us three manners of forming the *intrigue* of a poem; the firſt is that already mentioned; the ſecond is taken from the fable, and deſign of the poet; in the third, the *intrigue* is ſo laid, as that the ſolution follows from it of courſe.

INTRIGUE in common language is uſed to denote a plot; a private tranſaction in which ſeveral parties are engaged, and uſually an affair of love. Johnſon.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, &c. of any thing; in oppoſition to their *extrinſic*, apparent, or popular values, &c. See EXTRINSIC.

INTRITA, a name given by ſome authors to the *malcha*, a liquid bitumen uſed by the anciens inſtead of mortar in building.

INTRODUCTION, in *Rhetoric*, is the firſt part of an oration or diſcourſe, deſigned to prepare the minds of the hearers for a ſuitable reception of the ſucceeding parts: and for this purpoſe it is neceſſary that the orator gain the good opinion of his hearers, ſecure their attention, and give them ſome general notion of his ſubject. In order to gain the good opinion of his hearers, the orator, when he introduces the diſcourſe with his own perſon, will be careful to do it with modeſty, and ſeem rather to extenuate his virtues and abilities than to magnify them: when he ſets out with the perſons of thoſe to whom the diſcourſe is addreſſed, it is not unuſual to commend them for their virtues, and thoſe eſpecially which have a more immediate relation to the preſent ſubject. The other topics which are to be inſiſted upon for gaining eſteem, are principally taken from the ſubject, as its juſtice, importance, advantage, or pleaſure. In ſpeaking of gaining the attention of hearers, Cicero ſays, we ſhall be heard attentively by one of theſe three things; if we propoſe what is great, neceſſary, or for the intereſt of thoſe to whom the diſcourſe is addreſſed. Some account of the ſubject ſhould always make a part of the *introduction*. As to the compoſition of this part of a diſcourſe, it ſhould appear eaſy and natural, and connected with the reſt of the diſcourſe: it ſhould be ſuited to its length: the language of it ſhould be juſt, eaſy, and pleaſant: it ought neither to be wholly without paſſion, nor too violent and impetuous. It ought not to be too general. The *introduction*, however, is not an eſſential part of a diſcourſe, and is ſometimes omitted by the beſt orators. Ward's Or. vol. i. ſect. 12.

INTRODUCTOR, in *Antiquity*, was particularly uſed for an officer, who introduced the athletæ to the ſtadium, or place where they were to contend.

INTRONATI, the name of an academy at Sienna, in Italy.

The members of this academy, contented themſelves, at their firſt inſtitution, with eſtabliſhing the following ſix ſhort laws: 1. To pray. 2. To ſtudy. 3. To be merry. 4. To offend nobody. 5. Not to credit too lightly. 6. To let the world talk.

INTRUSION, in the *Canon Law*, ſignifies the enjoyment of a benefice, or exerciſe of an office, without a good title to it. See ENTRUSION.

The word is derived from *intruders*, to *thruſt in*, or *enter by force*.

Intruſion diſqualifies the party from ever holding the benefice.

INTRUSIONE, a writ brought againſt an *intruder*, by him that hath fee-ſimple, &c.

INTUITION, among *Logicians*, the act whereby the mind perceives the agreement or diſagreement of two ideas, immediately by themſelves, without the intervention of any other: in which caſe the mind perceives the truth, as the eye doth the light, only by being directed toward it. Thus the mind perceives that white is not black, that three are more than two, and equal to one and two. See IDEA.

This part of knowledge, ſays Mr. Locke, is irreſiſtible, and like the ſunſhine forces itſelf immediately to be perceived, as ſoon as the mind turns its view that way. It is on this *intuition* that all the certainty and evidence of our other knowledge depends: this certainty every one finds to be ſo great, that he cannot imagine, and therefore cannot require, a greater. See JUDGMENT, KNOWLEDGE, DEMONSTRATION, &c.

INTUITIVE *Evidence*, is that which reſults from INTUITION. Dr. Campbell diſtinguiſhes different ſorts of *intuitive* evidence: one reſulting purely from reflection, or that faculty which others have called intuition; another kind riſing from conſciouſneſs; and a third ſort from that new-named faculty, *common ſenſe*, which this ingenious writer as well as ſeveral others contend to be a diſtinct original ſource of knowledge; whilſt others refer its ſuppoſed office to the *intuitive* power of the underſtanding. Campbell's Rhetoric, vol. i. book i. chap. 5.

IN-TURN, among *Wreſtlers*, is when one puts his thigh between thoſe of his adverſary, and lifts up his thigh.

INVADIATUS, in our *Old Writers*, a perſon accuſed of any crime, which not being fully proved, he was put *ſub debita fide juſſione*, and called *invadiatus*.

INVALID, a perſon wounded, maimed, or diſabled for action by age.

At Chelſea and Greenwich are magnificent HOSPITALS or rather colleges, built for the reception and accommodation of *invalids*, or ſoldiers and ſeamen worn out in the ſervice.

We have alſo twenty independent companies of *invalids*, diſperſed in the ſeveral forts and garriſons.

At Paris is a college of the ſame kind, called *les Invalides*, which is accounted one of the fineſt buildings in that city.

INVECTED, in *Heraldry*, denotes a thing ſtated, or furrowed.

Invected is the juſt reverſe of *engrailed*, in which the points are turned outward to the field: whereas in *invected* they are turned inward to the ordinary. Vol. II. *Heraldry*, fig. 70.

INVECTIVE, in *Rhetoric*, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the perſon reproved; whereas *invective* is the work of an enemy, and entirely deſigned to vex and give uneaſineſs to the perſon againſt whom it is directed.

INVENTION denotes the act of finding any thing new; or even the thing thus found.

Thus we ſay, the *invention* of gunpowder, of printing, &c. The alcove is a modern *invention* owing to the Moors.

The Doric, Ionic, and Corinthian orders are of Greek *invention*; the Tuſcan and Compoſite of Latin *invention*. Janſon ab Almeloveen has written an Onomaſticon of *inventions*, wherein are ſhewn, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made.—Pancirollus has a treatiſe of old *inventions* that are loſt, and new ones that have been made; Polydore Virgil has alſo publiſhed eight books of the *inventors* of things. *De Inventoribus Rerum*.

INVENTION is alſo uſed for the diſcovery of a thing hidden.

The Romiſh church celebrates a feaſt on the fourth of May, under the title of, *Invention of the Holy Croſs*.

INVENTION is alſo uſed for ſubtilty of mind, or ſomewhat peculiar to a man's genius, which leads him to a diſcovery of things new.

In which ſenſe we ſay a man of *invention*: Wolfius has made ſome eſſays towards an art of *invention*.

INVENTION, in *Painting*, is the choice which the painter makes of the objects that are to enter the compoſition of his piece.

M. Felibien gives the general name *invention* to every thing that depends on the genius of the painter, as the ordonnance, the diſpoſition of the ſubject, and even the ſubject itſelf, when it is new.

In another place, that author diſtinguiſhes *invention* into two kinds; to wit, that which ariſes immediately from the mind of the painter, and that which he borrows from ſome other. The firſt is, when he abſolutely invents the ſubject himſelf; and the ſecond, when he borrows it from hiſtory, fable, &c.

De Piles obſerves, that *invention* is diſtinct from *diſpoſition*, and that theſe two things together form *compoſition*: for after having made a good choice of objects proper for the ſubject, they muſt be diſpoſed; and then, though the *invention* be ever ſo good, the diſpoſition or ordonnance will be faulty, and the piece will diſpleaſe.

Of all the parts of painting, *invention*, doubtleſs, is that which gives the painter the faireſt occaſions of ſhewing his genius, his imagination, and his good ſenſe.

INVENTION, in *Poetry*, is applied to whatever the poet adds to the hiſtory of the ſubject he has choſen; as well as to the new turn he gives it.

INVENTION, in *Rhetoric*, ſignifies the finding out, and cheoſing of certain arguments which the orator is to uſe for the proving or illuſtrating his point, moving their paſſions, or conciliating the minds of his hearers.

Invention, according to Cicero, is the principal part of oratory: he wrote four books *De Inventione*, whereof we have but two remaining.

This *invention* of the orators cannot, according to lord Bacon, be properly called *invention*; to ſpeak, is to diſcover things not yet known, not to recollect thoſe that are; whereas the uſe and office of this rhetorical *invention*, is only, out of the ſtock of knowlege laid up in the mind, to ſelect ſuch articles as make for the purpoſe.

The ſame author divides this faculty of *invention* into two parts, the one *topical*, the other promptuary: the firſt points out the way in which we are to purſue the argument; the latter only lays up and diſpoſes things, for which we have frequent occaſion, in the mind.

Invention furniſhes the orator with thoſe different kinds of arguments and motives which are adapted to the various purpoſes he has in view. The helps of *invention* are a lively imagination and readineſs of thought, great learning and extenſive knowledge, previous conſideration, and clear enlarged apprehenſions of the ſubject. See ARGUMENTS, COMMON PLACES, and TOPICS, &c.

INVENTORY, in *Law*, a catalogue, or account drawn up and made of all a deceaſed perſons goods and chattels, at the time of his death, with their value as prized by indifferent perſons, which every executor or adminiſtrator is obliged to exhibit to the ordinary at ſuch time as he ſhall appoint.

By 21 Hen. VIII. c. 5. Executors and adminiſtrators are to deliver in upon oath to the ordinary, indented *inventories*, one part of which is to remain with the ordinary, and the other part with the executor or adminiſtrator; this is required for the benefit of the creditors and legatees, that the executor or adminiſtrator may not conceal any part of the perſonal eſtate from them. The ſtatute ordains that the *inventory* ſhall be exhibited within three months after the perſon's deceaſe; yet it may be done afterwards, for the ordinary may diſpenſe with the time, and even with its being ever exhibited, as in caſes where the creditors are paid, and the will is executed.

The uſe of the *inventory* is borrowed from the civil law: for whereas by the law of the ancient Romans the heir was obliged to anſwer all the teſtator's debts; by which means, inheritance ſometimes became rather prejudicial than profitable; to obviate this inconvenience, Juſtinian ordained, that if the heir would firſt exhibit a true *inventory* of all the teſtator's effects, he ſhould be no farther charged than to the value of the *inventory*.

INVENTORY, in *Trade*, is a bill, or particular valuation of goods, &c. See VALUE, APPRAISEMENT, &c.

INVERSE, is applied to a manner of working the rule of three, or proportion, which ſeems to go backwards, or contrarily to the order of the common and direct rule.

In the rule of three direct, the firſt term is to the ſecond as the third is to the fourth; that is, if the ſecond be greater than the third, or leſs than the firſt, in any proportion, the fourth is leſs than the third in the ſame proportion.—But in the *inverſe* rule, the fourth term is as much greater than the third, as the ſecond is leſs than the firſt.

In the *inverſe* rule, therefore, the proportion is not as the firſt is to the ſecond ſo is the third to the fourth; but as the fourth is to the firſt, ſo is the ſecond to the third. For inſtance, in the direct rule we ſay, If three yards of tapeſtry coſt twenty pounds, how much will ſix coſt? The anſwer is, forty. In the *inverſe* rule we ſay, If twenty working men make ten yards in four days, in how many days will forty do it? The anſwer to this, is in two days. See RULE *of Three*.

INVERSE *Method of Fluxions*. See FLUXIONS.

INVERSE *Planting*. See PLANTING.

INVERSE *Proportion*. See PROPORTION.

INVERSION, the act whereby any thing is inverted, or turned backwards.

Problems in geometry and arithmetic are often proved by *inverſion*; that is, by a contrary rule, or operation.

INVERSION, in *Grammar*, is where the words of a phraſe are ranged in a manner not ſo natural as they might be. For an inſtance: 'Of all vices, the moſt abominable, 'and that which leaſt becomes a man, is impurity.'—Here is an *inverſion*; the natural order being this: Impurity is the moſt abominable of all vices, and that which leaſt becomes a man.

An *inverſion* is not always diſagreeable, but ſometimes has a good effect.

INVERTED *Cyclans, Point, Volt*. See the ſubſtantives.

INVESTIGATION properly denotes the ſearching or finding any thing out, by the tracks, or prints of the feet.

Hence, mathematicians, ſchoolmen, and grammarians, came to uſe them in their reſpective reſearches.

INVESTIGATION *of a Theme*, is the art, method, or manner of finding the themes of verbs, that is, the primitive tenſe, mood, and perſon, of any verb, far removed from its ſource. To underſtand a Greek author, it is abſolutely neceſſary to be well acquainted with the method of *inveſtigating* a theme. This theme, in the Greek tongue, is the preſent tenſe of the indicative mood.

Clenard was the firſt who introduced this term into grammar: he gives the title *inveſtigatio themutis* to that part where he teaches the manner of finding whence any perſon, or tenſe, or verb, proceeds, and of reducing it to its primitive word, or finding its indicative.

INVESTING, the act of conferring on any one the right or property, of a fee, dignity, or office, or of ratifying and confirming what has been obtained elſewhere.

The emperor pretends to a right of *inveſting* ſeveral princes, both in Germany and Italy. There was formerly a particular ceremony for the *inveſting* of biſhops. After the election of a knight of the GARTER, he is *inveſted*

inveſted by the ſovereign with the two principal enſigns of the order, the Garter and George.—Before his inſtallation he is alſo *inveſted* with the habit of the order.

INVESTING, in the *Military Art*, ſignifies the opening a ſiege, and the encamping of an army round the place; to block up its avenues, and prevent all ingreſs and egreſs.

It is the cavalry that always begins to *inveſt* a place.

INVESTING, in *Common Law*, ſignifies the putting in poſſeſſion. A tenant is *inveſted* by giving him a verge, or rod, into his hands, and adminiſtering an oath.

Others define it thus: *Inveſtire eſt in ſuum jus aliquem introducere*, to give livery of ſeiſin, or poſſeſſion. See LIVERY, and SEISIN.

INVESTITURE is uſed both for the right, and the act, of inveſting a tenant, or vaſſal; that is, of receiving the faith and homage by which a vaſſal becomes ſeiſed, and poſſeſſed of a fee, by his lord.

Inveſtiture was anciently performed by rehearſing a formula of words; afterwards by the delivery of ſuch things as had the neareſt reſemblance to what was tranſferred. Thus, land paſſed by the delivery of a turf; and to ſhew the trees were tranſferred at the ſame time, a bough was cut and delivered along with it.

In after-times, the things by which *inveſtitures* were made were not ſo ſtrictly obſerved.—Many were inveſted by the delivery of a ſtaff, a glove, a knife, a piece of a cloak, of a ſtrap, and a girdle: or by pricking the thumb, by giving the keys, a ſpit, a blow, a ring, a turf, a bough, a ſtraw, &c. The *inveſtiture* of a kingdom or biſhop, was performed by a ſtandard, a banner, a cap, a ſword, a book, arrows, ſpurs, &c.

The ſymbols were ſometimes preſerved in the repoſitories of the houſes, and were annexed to the titles.

INVESTITURES were alſo uſed with reſpect to ſpiritual benefices. Theſe were frequently performed by delivering the croſier and paſtoral ring.

The kings of England and France, the emperors of Germany, &c. had formerly this right; ſo that on the death of a prelate, his clergy ſent the croſier, &c. to their ſovereign, to be uſed at the ceremony of *inveſting* his ſucceſſor. It is not certain when this cuſtom began; Cardinal Humbert places the commencement of it in the reign of Otho the Great: and it appears, that in the ninth century, the greater part of the European princes made no oppoſition to the right of electing the BISHOPS, which was both claimed and exerciſed by the clergy and the people. The firſt who diſputed this privilege with the emperors and ſovereign princes, was Gregory VII. he excommunicated the emperor Henry IV. and forbad all eccleſiaſtics, under pain of *excommunication*, to receive *inveſtiture* at the hands of ſecular princes. This occaſioned a long and bloody war; the civil and eccleſiaſtical powers being divided into two great factions, of which one maintained the rights of the emperor, while the other ſeconded the ambitious views of the pontif. The laws of Gregory for the abolition of *inveſtitures* were confirmed and renewed by Victor III. and Urban II. the laſt of whom not only confirmed the laws and anathemas of Gregory, in a council aſſembled at Placentia in the year 1095; but publiſhed alſo a prohibitory law in the council of Clermont, forbidding the biſhops and the reſt of the clergy to take the oath of allegiance to their reſpective ſovereigns. Paſcal II in a council aſſembled at Rome, A. D. 1102, renewed the decrees of his predeceſſors againſt *inveſtitures* and the excommunications, they had thundered out againſt Henry IV. Paſcal, however, was obliged in 1111, to confirm Henry V. in the right of giving *inveſtitures*; but repenting what he had done, he aſſembled a council in the church at Lateran, in 1112, which ſolemnly annulled his treaty with the emperor, who was excommunicated in many ſynods and councils, both in France and Germany. At length, however, Caliſtus II. engaged him to renounce *inveſtitures* on certain conditions, and peace was concluded between the emperor and pope's legates, at a general diet held at Worms, A. D. 1122. This convention was confirmed the following year in the general council of Lateran, and remains ſtill in force.

INULA, in *Botany*. See ELECAMPANE.

INVOCATION, in *Theology*, an act whereby we adore God, and call on him for his aſſiſtance.

The Romaniſts alſo practiſe *invocation* of ſaints, begging them to intercede with God in their behalf. This is one of the grand articles of diſpute between the Romaniſts and the Reformed.

INVOCATION, in *Poetry*, an addreſs at the beginning of a poem, wherein the poet calls for the aſſiſtance of ſome god, particularly of his Muſe, or the deity of poetry. See MUSES.

This part is abſolutely neceſſary in an EPIC poem, becauſe the poet relates things which he could not be ſuppoſed to know, unleſs ſome deity inſpired him. Beſides this ſerves his readers as an example of piety and devotion, which ought to be the foundation of his whole work. To theſe it may be added, that the gods themſelves are to have a part in the action; and it is not decent he ſhould ſet them to work, without firſt aſking them leave.

Indeed, in the courſe of an epic poem there are uſually ſeveral *invocations*; particularly where any thing extraordinary, or miraculous, comes to be related; as that when Virgil deſcribes the metamorphoſis of Æneas's fleet into ſea nymphs: but the firſt *invocation* is always the moſt conſiderable.

In the *invocation* Boſſu conſiders two things: the firſt is, what the poet requeſts; the ſecond, to what deity he addreſſes his requeſt. As to the firſt, Homer has joined the *invocation* ſo cloſely to the propoſition, that he ſeems to *invoke* his muſe for the whole work.—But Virgil, on the contrary, only requeſts his Muſe to furniſh him with a part of his ſubject; and even mentions what particular part it is he deſires.—After propoſing his matter in all its extent, he begs the Muſe to acquaint him with the cauſe of it. See PROPOSITION.

As to the deity *invoked*, the ſame author obſerves, that it muſt always be, either the divinity that preſides over poetry in general, or that which preſides over the particular ſubject of the work. Ovid's *invocation*, in his Metamorphoſes, is of the latter kind; and ſo is that of Lucretius: thoſe of Homer and Virgil are of the former kind; they only invoke the Muſes; and thus they diſtinguiſh between the divinities who preſide over poetry, and thoſe who preſide over the actions of the poem, and have parts in it.

By the way, it may be obſerved, that the deities *invoked* are not looked on, even by the poets themſelves, as divine perſonages from whom they expect any real aſſiſtance. Under the name of Muſe they wiſh for the genius of poetry, and for all the qualities neceſſary for the execution of their deſign. Theſe are mere allegories, or manners of expreſſing themſelves poetically; juſt as when they perſonify and make gods of ſleep, of reſt, fame, and other natural and moral things. And thus the Muſes come to be of all ages, countries, and religions; there are Pagan, Chriſtian, Greek, Latin, and Engliſh Muſes.

INVOICE, or INVOYCE, a liſt, or account, of commodities, with their value, cuſtoms, proviſion, charges, &c. ſent by a merchant to his factor, or correſpondent, in another country.

INVOICE, *book of*. See BOOK.

INVOLUCRUM, among *Botaniſts*, expreſſes that ſort of cup which ſurrounds a number of flowers together, every one of which has beſide this general cup its own particular periantium. The *involucrum* conſiſts of a multitude of little leaves diſpoſed in a radiated manner. See CALYX.

INVOLUNTARY *motion*. See MOTION.

INVOLUTE *curve*, in the *Higher Geometry*. See EVOLUTE.

INVOLUTION, in *Algebra*, the raiſing any quantity from its root, to any height, or POWER, aſſigned.

Any quantity multiplied by itſelf, the product is the ſquare of that quantity; the ſquare being again multiplied by the quantity, produces its cube. See SQUARE and CUBE.

Thus if $a + b$ were to be raiſed to its ſecond power, it will produce $aa + 2ab + bb$.

And if it be *involved* again, or if that ſquare be multiplied by the root, the cube or third power, will be produced; viz. $aaa + 3aab + 3abb$, &c. ſo that the *involution* of any compound quantity is performed by a continual multiplication of it by itſelf: if the powers of $a - b$ are required, they will be found the ſame as thoſe of $a + b$, except that the terms in which the exponent of b is an *odd* number will be negative, becauſe an odd number of multiplications of a negative produce a negative: or, in general, the terms of any power of $a - b$ are poſitive and negative by turns. See BINOMIAL *Theorem*.

If a quantity conſiſting of three or more terms is to be involved, it may be diſtinguiſhed into two parts, which are to be raiſed to any power in the ſame manner as a binomial; and then by the ſame rules, the value of theſe compound parts may be ſubſtituted in their ſtead: thus $\overline{a+b+c}^2 = \overline{a+b}+c^2 = a+b^2 + 2c\times a+b+c^2 = a^2 + 2ab + b^2 + 2ac + 2bc + c^2$.

And $\overline{a+b+c}^3 = a+b^3 + 3c\times\overline{a+b}^2 + 3c^2\times\overline{a+b} + c^3 = a^3 + 3a^2b + 3ab^2 + b^3 + 3a^2c + 6abc + 3b^2c + 3ac^2 + 3bc^2 + c^3$. The reverſe of *involution* is called EVOLUTION. See EXTRACTION of ROOTS, and ROOT.

INWARD *Sanding Angle*, in *Fortification*; see ANGLE.

JOA *moschata*, in *Botany*, a name used by some authors for the chamæpitys, or ground-pine.

JOACHIMITES, in *Ecclesiastical History*, the name of a sect, the followers of one Joachim, abbot of Flora, in Calabria, who was esteemed a prophet while he lived, and left, at his death, several books of prophecies, contained in his Everlasting Gospel, commonly called the Book of Joachim, besides other works; which were condemned, in 1215, by the council of Lateran; and by the council of Arles, in 1260.

One of the spiritual friars, named Gerhard, belonging to the order of FRANCISCANS, undertook to explain the Everlasting Gospel of Joachim, in a book published in 1250, entitled the Introduction to the Everlasting Gospel. In this work St. Francis is declared to be the angel mentioned in the Revelation xiv. 6. who had promulgated the true and everlasting gospel of God: it is also asserted, that the gospel of Christ was to be abrogated in 1260, and this new gospel to be published in its room; and that the ministers of this signal reformation were to be humble and bare-footed friars, destitute of all worldly emolument. This absurd book was suppressed by order of pope Alexander IV. in 1255, and at length publicly committed to the flames.

The *Joachimites* were particularly fond of certain ternaries: the Father, said they, operated from the beginning till the coming of the Son; the Son from that time to theirs, viz. the year 1260; and the Holy Spirit then took it up, and was to operate in his turn.—Hence they divided every thing that related to men, time, doctrine, and manner of living, into three classes, or states, according to the three persons in the Trinity; every one of which states either had already, or was hereafter to succeed in its turn; and hence they called their divisions *ternaries*.

The explication given by Joachim, of the Trinity, in opposition to Peter Lombard, which was considered by many as differing little from the Arian system, procured the damnatory sentence of his doctrine by Innocent III. in the council of Lateran: but, notwithstanding this papal sentence, Joachim has still a considerable number of adherents and defenders, more especially among those of the Franciscans, who are called Observants, or FRIARS *observant*.

JOB, *or the Book of* JOB, a canonical book of the Old Testament, containing the narrative of a series of misfortunes, which happened to a man whose name was *Job*, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes: and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend, that this relation is altogether a fiction; others think it a simple narrative of a matter of fact, just as it happened; while a third sort of critics own the ground-work of the story to be true, but that it is wrote in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

See an express dissertation on the book of *Job*, in the bishop of Gloucester's Divine Legation of Moses, vol. ii.

The bishop is of opinion that this book is a dramatic poem, written by Ezra, some time between the return of the Jews from the captivity of Babylon, and their thorough settlement in their own country, and adapted to the circumstances of their times, by being made allegorical as well as dramatic: that, Job, who is supposed to have been a real person, that lived a generation or two before Moses, is designed to personate the Jewish people; his three friends, the three great enemies of the Jews, Sanballat, Tobiah, and Gethem, who, upon their return from the captivity, vexed and obstructed them in rebuilding their city and temple; Job's wife was intended by the poet to represent the idolatrous wives which many of the Jews had taken, contrary to the law, and for which they are reproved by the prophet Nehemiah. Le Clerc also supposes that the book of *Job* was written after the Jews were carried into Babylon, and urges, in proof of this, the frequent Chaldaisms that occur in it.

The learned Grotius apprehends that this book contains a true history, treated in a poetical manner; that the events recorded in it happened in Arabia, whilst the Hebrews wandered in the desert; and that the writer, who was a Hebrew, lived before the time of Ezekiel, but after David and Solomon; and that it was written for the use of the Edomites, transported to Babylon, to confirm them in the worship of the true God, and to teach them patience in adversity. Schultens ascribes the poetical, or dialogue part of this book, the style of which, he says, has all the marks of the most venerable and remote antiquity, to *Job* himself; the rest he supposes to be the work of some Hebrew collector. Most of the Jewish doctors believe, that Moses was the writer of this book; and M. Huet supposes that it was written by Moses in his exile in the land of Midian: nor is it improbable that it was designed to prepare the Israelites for their exodus from Egypt, and the hardships of their future peregrination.

JOB's *tears*, *Gör*, in *Botany*, a genus of the *monœcia triandria* class. Its characters are these: it hath male and female flowers on the same plant, and the male flowers are disposed in a loose spike; the chaff of these have valves, inclosing two flowers; the petal has two oval valves, these have each three hairy filaments, terminated by oblong four-cornered summits; there are a few female flowers situated at the base of the male spike in the same plant, having a bivalvular chaff; the petal hath two oval valves, and they have a small oval germen, supporting a style divided into two parts, which becomes a hard roundish smooth seed. There are two species, the first of which grows naturally in the islands of the Archipelago, and is frequently cultivated in Spain and Portugal, where the poor inhabitants make a coarse sort of bread of the grain.

JOBBER, a person who undertakes *jobs*, or small pieces of work.

In some statutes, *jobber* is used for a person who buys and sells cattle for others. See BROKER.

JOBENT *nails*. See NAILS.

JOCKEY, in the management of horses; the person who trims up, and rides about horses for sale.

JOCKLET, or JOCKET, a term used in some parts of Kent, for a little farm which requires but one yoke of oxen to till it.

JOEL, or *the Prophet of* JOEL, a canonical book of the Old Testament. *Joel* was the son of Pethuel, and the second of the twelve lesser prophets. The style of this prophet is figurative, strong, and expressive. He upbraids the Israelites for their idolatry, and foretels the calamities they should suffer as the punishment of that sin: but he endeavours to support them with the comfort that their miseries should have an end upon their reformation and repentance. Some writers, inferring the order of time in which the minor prophets lived from the order in which they are placed in the Hebrew copies, conclude that *Joel* prophesied before Amos, who was contemporary with Uzziah, king of Judah. Archbishop Usher makes this inference from *Joel*'s foretelling that drought, chap. i. which Amos mentions as having happened, chap. iv. 7, 8, 9. If we consider the main design of *Joel*'s prophecy, we shall be apt to conclude, that it was uttered after the captivity of the ten tribes; for he directs his discourse only to Judah, and speaks distinctly of the sacrifices and oblations that were daily made in the temple. *Lowth.*

JOGHIES, a sect of heathen religionists in the East Indies, who never marry, nor hold any thing in private property; but live on alms, and practise strange severities on themselves.

They are subject to a general, who sends them from one country to another to preach: they are, properly, a kind of penitent pilgrims; and are supposed to be a branch of the ancient Gymnosophists.

They frequent, principally, such places as are consecrated by the devotion of the people, and pretend to live several days together without eating or *drinking*. After having gone through a course of discipline for a certain time, they look upon themselves as impeccable, and [illegible] to do any thing upon which they give [illegible] passions, and run into all manner of debauch[illegible]

JOHN, *Christians of* ST. JOHN. See CHRISTIANS.

St. JOHN *Baptist, hermits of*. See HERMITS.

JOHN, *Presbyter*. See PRESBYTER.

JOHN, *the Gospel of St.* JOHN, a canonical book of the New Testament, containing a recital of the life, doctrine, and death of our Saviour, Jesus Christ, written by St. JOHN, the apostle and evangelist. See GOSPEL.

St. *John*, according to Mill, Fabricius, and Le Clerc, wrote his Gospel at Ephesus, after his return from the isle of Patmos, A. D. 97, at the desire of the Christians of Asia. Wetstein thought that this Gospel might be writ about the year 32, after our Lord's ascension: Basnage and Lampe suppose that it was writ before the destruction of Jerusalem: Dr. Lardner adopts this opinion, and assigns the date of it to the year of Christ 68. This period brings it nearer to that of the three other gospels, which was about the year 64 or 65, and the Gospel itself, the leading design of which was to shew how inexcusable the Jews were in not receiving Jesus as the Christ, and to vindicate the providence of God in the calamities already befallen, or now coming upon them, was suitable to the circumstances of the Jews at this period. The ancients

ancients aſſign two reaſons for this undertaking: the firſt is, becauſe in the other three Goſpels, there was wanting the hiſtory of the beginning of Jeſus Chriſt's preaching, until the impriſonment of John the Baptiſt, which therefore he applied himſelf particularly to relate: the ſecond reaſon was, in order to remove the errors of the Cerinthians, Ebionites, and other ſects. But Mr. Lampe and Dr. Lardner have urged ſeveral reaſons to ſhew that St. *John* did not write againſt Cerinthus or any other heretics in his Goſpel. Lamp. Prolegom. in Johan. lib. ii. cap. 3. Lardner's Credibility, vol. xv. ch. 9.

St. JOHN's *bread*, ſee CAROB.

Sweet JOHNS, ſee PINK.

JOHN's *wort*, or *St.* JOHN's *wort*, *hypericum*, in *Botany*, a genus of the *polyadelphia polyandria* claſs. Its characters are theſe: the flower has a permanent empalement, divided into five oval concave ſegments, and has five oblong oval petals, with a great number of hairy ſtamina, joined at their baſe in five diſtinct bodies: it has in the centre a roundiſh germen ſupporting one, three, or five ſtyles; the germen afterward becomes a roundiſh capſule, having the ſame number of cells as there are ſtyles in the flower, which are filled with oblong ſeeds. There are many ſpecies.

Hypericum is a good vulnerary, detergent, and nervous medicine: it is given with ſucceſs in ſpitting of blood, or voiding it by urine; it reſolves coagulated blood, promotes the menſes and urine, deſtroys worms, and ſtands recommended in all nervous caſes. A tincture of the flowers in oil olive, made by macerating four ounces of the full blown flowers, freſh gathered, and freed from the cups, in a quart of oil, till the oil is ſufficiently coloured, is kept for external purpoſes in the ſhops, under the name of *oleum hyperici*, but rarely uſed.

The ſeed of the baſtard *St. John's wort*, provokes urine and the menſes; and taken in wine is good againſt the bite of the phalangium (a poiſonous ſpider), and for that ſpecies of convulſion called *opiſthotonus*. Oil alſo impregnated with this plant, is good for the laſt mentioned diſorder, applied externally.

JOHNSONIA, *calliocarpa*, in *Botany*, a genus of the *tetrandria monogynia* claſs. Its characters are theſe: the flower has an empalement of one leaf, cut at the brim into four ſhort ſegments; it has one tubulous petal, divided into four parts at the brim, and four ſtender ſtamina, which are longer than the petal. In the centre is ſituated a roundiſh germen, which afterward becomes a ſmooth globular berry, including four hard oblong ſeeds. Miller reckons only one ſpecies, a native of South Carolina; but Linnæus enumerates two. The leaves of the American plant were uſed by Dr. Dale in dropſical caſes with ſucceſs.

JOINDER, or JOYNDER; is the coupling, or joining, two perſons in one action, or ſuit, againſt another.

JOINERY, ſee JOYNERY.

JOINING *of iſſue*, ſee ISSUE.

JOINT, the juncture, articulation, or aſſemblage, of two or more things. See ARTICULATION.

JOINTS, in *Anatomy*. The ſuppleneſs which the *joints* may be brought to by long practice from the time of infancy, is ſurpriſing. Every common poſture-maſter at a country fair ſhews us a great deal of this; but the moſt wonderful inſtance we have ever had of it, was in the perſon famous in London ſeveral years ago, whoſe name was Clark, and commonly called Clark the poſture-maſter. This man had found the way, by long practice, to diſtort many of the bones, which nobody before had ever thought it practicable to alter the poſition of; and had ſuch an abſolute command of the muſcles and *joints*, that he could almoſt diſjoint his whole body: ſo that he once impoſed on the famous Mullens by his diſtortions, ſo far that he refuſed to undertake his cure, as ſuppoſing him beyond relief. But, to his amazement, he had no ſooner given him over, than the man reſtored himſelf to the figure and condition of a proper man, with no diſtortion about him. See Phil. Tranſ. N° 242. p. 262.

JOINT-*cartilage*, or ARTICULATING-*cartilage*. An *articulating cartilage* is an elaſtic ſubſtance, uniformly compact, of a white colour and ſomewhat diaphanous, having a ſmooth poliſhed ſurface covered with a membrane, harder and more brittle than a ligament, but ſofter and more pliable than a bone.

When a *joint-cartilage is* well prepared by the anatomiſt, it feels ſoft, and yields to the touch; but, as ſoon as the preſſure is taken off, reſtores itſelf to its former equality of ſurface. Its ſuperficies, examined by a glaſs, appears like a piece of velvet. If we endeavour to peel off the matter of the cartilage in ſeveral lamellæ, we find it impracticable; but if we uſe a certain degree of force, it ſeparates from the bone in ſmall pieces, and we never find the edge of the remaining part oblique, but always perpendicular to the ſubjacent ſurface of the bone. If we view this edge through a microſcope, it appears like the edge of a piece of velvet: that is, it is ſeen to be a maſs of ſhort and nearly parallel fibres, riſing from the bone and terminating at the ſurface of the cartilage; and the ſurface of the bone is planed out into a number of ſmall circular dimples, in which the bundles of theſe fibres are fixed. Thus we may very aptly compare the ſubſtance of the cartilage to the pile of velvet, and the ſurface of the bone to the web of ſilk which is the baſis of it.

In both ſubſtances the ſhort threads or filaments ſink in waves on being preſſed, but by the power of elaſticity they both recover their perpendicular direction as ſoon as they are no longer ſubjected to a compreſſing force. Theſe perpendicular fibres, doubtleſs, make the greateſt part of the ſubſtance of the cartilage in its natural ſtate. In the beſt preparations they ſeem to make up the whole; but it is probable, that in the recent ſtate there were a number of tranſverſe fibrils ſerving to connect theſe erect ones together, and form the whole into a ſolid body; and that theſe periſh in making the preparation.

We are told by anatomiſts, that cartilages are covered with a membrane called perichondrium. If they mean the cartilages of the ribs, larynx, ear, &c. there indeed ſuch a membrane is very conſpicuous; but the perichondrium of the ſmooth *articulating cartilages* is ſo delicately thin, and ſo firmly braced upon the ſurface, that there is great room to doubt, whether it has been rightly underſtood, or demonſtrated.

This membrane has, however, been raiſed by ſome late anatomiſts in pretty large pieces, after macerating, and it is found to be a continuation of that fine ſmooth membrane which lines the capſular ligament folded over the end of the bone; for when that ligament is inſerted on the neck of the bone, or between the inſertion of the ligament and the border of the cartilage, it is very conſpicuous, and may be pulled up with a pair of pincers; but where it covers the cartilage, it is connected ſo cloſe, that it is not to be traced while recent, without the greateſt care and delicacy. In this particular it reſembles that membrane which is common to the eye-lids and the ſore part of the ball of the eye, and which is looſely connected with the albuginea, but ſtrongly attached to the cornea. From this deſcription it is plain, that every *joint* of the human body is inveſted with a membrane, which forms a complete bag, and gives a covering to every thing within the articulation, in the ſame manner as the peritonæum inveſts not only the parietes, but all the contents of the abdomen.

The blood-veſſels of the cartilages are ſo ſmall, that they do not admit the red globules of the blood, and conſequently they remained unknown till they were diſcovered by the modern method of injections, by which the whole vaſcular ſyſtem is filled with a liquid wax, coloured ſo as to be diſtinguiſhed from all other things: nor even by this method are we able to demonſtrate the veſſels of the true cartilaginous ſubſtance in adult ſubjects. But the fat, the glands, and the ligaments will be red with injected veſſels, while not one coloured ſpeck appears on the cartilage itſelf. Yet it is evident, that there are veſſels there, ſince in very young ſubjects after a ſubtile injection, they become ſufficiently obvious. By this means their courſe is alſo diſcovered, and is found to be as follows.

All round the neck of the bone there are a great number of arteries and veins which ramify into ſmaller branches, and communicate with one another by frequent anaſtomoſes like thoſe of the meſentery. This might be called the *circulus articuli vaſculoſus*, the vaſcular body of the *joint*. The ſmall branches of the veſſels divide into ſtill ſmaller ones upon the adjoining ſurface in their progreſs to the centre of the cartilage; and we are very ſeldom able to trace them into its ſubſtance, becauſe they terminate abruptly at the edge of the cartilage in the ſame manner with the veſſels of the albuginea of the eye, when they arrive at the cornea. The larger veſſels which compoſe the vaſcular circle plunge in by a great number of holes, and diſperſe themſelves into branches between the cartilage and the bone. From theſe again there ariſes a crop of ſhort twigs, which ſhoot towards the outward ſurface. Whether theſe ſerve for nourihment only to the part, or whether they do not pour forth a dewy moiſture, of ſervice to the functions of the part, is not eaſily determined. It is to be obſerved, however, that the diſtribution of the blood-veſſels to the articulating cartilages, is very peculiar, and ſeems calculated for the obviating of great inconveniencies. Had they run to the outer ſurface, the preſſure and motion of the two cartilages muſt infallibly have occaſioned frequent obſtructions and inflammations, which would ſoon have rendered our motions painful, and at laſt have deprived us of them; but by creeping round the cartilaginous brim where there

is little friction, or under the cartilage where there is none, they are perfectly well defended from these accidents.

It would be very happy, if we could trace the nerves of the cartilages; but in relation to these organs we are obliged to be satisfied by mere conjecture, as to their existence here, as well as in many other parts of the body. And though from the great insensibility of cartilages some persons have supposed, that they were furnished with no nerves at all, yet when we consider that these vessels seem necessary to the growth and preservation of any part, we must be forced to acknowledge their existence in this, though we can neither see them, nor be sensible of their effects.

The articulating cartilages are most happily contrived to all the purposes of motion in the parts. By their uniform surface they move upon one another with ease; by their softness, smoothness and slipperiness, their abrasion is prevented, which else must have happened from such frequent use. By their flexibility, the contiguous surfaces are always nicely adapted to one another, and the friction diffused equally over the whole; by their elasticity the violence of any shock which may happen from running, jumping, or other violent motions, is broken and gradually spent; and as the course of the cartilaginous fibres appears calculated chiefly for this last advantage, we need only, to illustrate it, to reflect upon the difference of riding a chamber-horse of wood, and a real one, whose motions are softened in all respects by the cartilages placed in the *joint*.

The insensibility of the articulating cartilages is wisely contrived by the great Author of our frame, since it is wholly owing to this that the necessary motions of the body are performed without pain.

An ulcerated cartilage is generally allowed, by the best chirurgical writers from Hippocrates to the present time, to be a very troublesome disease, and one that is more difficult to cure than a caries of the bones; and that when a cartilage is destroyed, it is never to be recovered again, is also a generally established opinion. Hildanus in particular, in treating of the diseases of these parts, has observed, that where a cartilage is by any means destroyed, nature usually supplies its place by a callus thrown out from the bone, and that thus a bony anchylosis, or immoveable continuity, is produced in the place of a moveable *joint*. In examining the diseased *joints*, either after death or amputation, Mr. Hunter observes, that he usually found, according to the nature and stage of the disease, the cartilages in some parts reddish and lax, and in others soft and spongy; or that they were raised up in blisters from the bone, or quite eroded, and perhaps the extremities of the bone carious; and finally, sometimes a bony anchylosis formed, as Hildanus reports; but that he never saw, or indeed heard of, an exfoliation from the surface of the cartilage. Now if we compare the texture of the cartilages, and their morbid appearances together, all these diseased states will admit of as rational a solution, as these of perhaps any other part of the vitiated œconomy. Phil. Trans. N° 469. p. 521.

It appears from macerating of the cartilages, that their transverse fibrils are extremely tender and dissoluble, and that the cohesion of the parts of the straight fibres is stronger than their cohesion with the bone. When a cartilage, therefore, is inflamed, and soaked in purulent matter, the transverse, or connecting fibres, will soonest give way, and the cartilage will become more or less red and soft. If the disorder goes on a little longer, the cartilage does not throw off a slough, but separates from the bone where the force of the cohesion is least, and where the disease soon arrives, by reason of the thinness of the cartilage. When the bone is thus exposed, the matter of the ulcer, or motion of the *joint*, corrodes or abrades the bony fibres, and if the constitution is good, these will shoot out a callus, which either cements together the opposite bones of the articulation, or fills up the cavity of the *joint*, and for the future prevents all motion: but if unfortunately the patient labours under a bad habit of body at the time, the malignancy having got root in the bone, will gain ground every day, and the caries will spread, till at last the only relief will be found the cutting off the limb.

JOINTS, in *Architecture*, denote the separations between the stones; which are filled with mortar, plaster, or cement.

JOINT, in *Carpentry*, &c. is applied to several manners of assembling, or fitting, pieces of wood together. Thus we say, *a dove-tail joint*, &c. See MORTISE, DOVE-TAIL, &c.

JOINT, *universal*, in *Mechanics*, an excellent invention of Dr. Hook, adapted to all kinds of motions and flexures; of which he has given a large account in his Cutlerian Lectures, printed in 1678. This seems to have given occasion to the GIMBOLS used in suspending the sea compass, the mechanism of which is the same with that of Desaguliers's *rolling* LAMP.

JOINT-*action*, in *Law*, in personal actions several wrongs may be *joined* in one writ; but actions founded upon a tort, and on a contract, cannot be *joined*; for they require different pleas and different process.

JOINT-*battery*. See BATTERY.

JOINT-*executors*, in *Law*, are two or more persons appointed such by will: in which case they are accounted but as one single person, so that the actions done by one of them are taken to be the acts of all, because they all represent the person of the testator: thus, where two *joint*-executors are possessed of a lease for years, in right of their testator, one of them may sell the term without the other's joining: and in like manner, where one *joint*-executor gives a release, the others are bound by it, each having an authority over the whole estate; but a *joint*-executor is not charged with the acts of his companion any further than he is actually possessed of the goods of the testator: however, if *joint*-executors enter into an agreement, that each shall intermeddle with particular parts of the testator's estate, in that case each becomes chargeable for the whole by agreement. It has been held, that two *joint*-executors cannot urge separate pleas, because their testator, if living, on an action brought against him, could have been allowed but one plea; and that if all the executors are not named in any action brought by *joint*-executors, the action will abate. As to legacies, the receipt of one EXECUTOR charges not the other.

JOINT-*lives*, in *Law*, denote lives that continue during the same time, or that exist together. See LIFE-*annuities*.

JOINT-*rule*. *See carpenter's joint* RULE.

JOINTENANTS, or JOINT-TENANTS, in *Law*, those who come to, and hold, lands and tenements by one title, *pro indiviso*, or without partition.

These are distinguished from *sole*, or several tenants, from *parceners*, and from *tenants in common*. Anciently they were called *participes*, and not *haredes*. See SOLE *tenant*.

Joint-tenants must jointly plead, and be jointly impleaded and sued by others; which is common to them and COPARCENERS. But *joint-tenants* have a peculiar quality of *survivorship*, which coparceners have not; so that if there be two or three *joint-tenants*, and one hath issue, and dies, he, or those *joint-tenants* that survive, shall have the whole by survivorship.

JOINT-*water*, a term used by our farriers, for what the old writers in medicine have called hydarthros; a running of a clear ichor from the *joints*, when they are either wounded or ulcerated; it is common in the diseases of horses.

JOINTEE. in the *Manege*. See HANDFUL.

JOINTRESS, or JOINTURESS, she that hath an estate settled upon her by the husband, to hold during her life, if she survives him.

JOINTURE, in *Law*, a covenant whereby the husband, or some friend in his behalf, makes over to his wife, on condition of marriage, certain lands and tenements for term of her life, or otherwise, in lieu of DOWER.

Others define *jointure* a bargain and contract of livelihood, adjoined to the contract of marriage; being a competent provision of freehold lands or tenements, &c. for the wife, to take effect after the death of the husband, if she herself is not the cause of the extinguishment or forfeiture of it.

And to make a perfect *jointure* within the [illegible] Hen. VIII. c. 10. to bar dower, several things are observed. 1. It must be made to take effect [illegible] of the wife in possession or profit, presently [illegible] cease of her husband. 2. It must be for the [illegible] own life, or a greater estate; but it may be limited to continue no longer than she remains a widow, &c. 3. It must be made for herself, and to none other, in trust for her. 4. It is to be expressed to be in satisfaction of her whole dower, and not a part of it. 5. It may be made before or after marriage: if it be made before, the wife cannot waive it, and claim her dower at common law; but if it be made after marriage, she may, at the husband's death; unless the *jointure* be made by act of parliament. After the death of the husband, the wife may enter into her *jointure*, and is not driven to a real action, as she is to recover dower by the common law; and upon a lawful eviction of her *jointure*, she shall be endowed according to the rate of her husband's lands, wherein she was dowable at common law.

A wife's *jointure* shall not be forfeited by the treason of the husband: but feme-coverts committing treason, or felony, may forfeit their *jointures*, and being convict of [illegible]

recusancy, they shall forfeit two parts in three of their *jointures* and dower, by 3 Jac. I. c. 4.

JOISTS, or JOYSTS, in *Architecture*, those pieces of timber framed into the girders and summers on which the boards of floors are laid.

Joists are from six to eight inches square, and ought seldom to lie at a greater distance from each other than ten or twelve inches; nor ought they ever to bear at a greater length than ten feet; or to lie less into the wall than eight inches. See CHIMNEY.

Sometimes the carpenters furr their *joists*, as they call it; that is, they lay two rows of *joists*, one over the other.

JOKES. See JESTING.

JON, in *Natural History*, the name of a gem described by Pliny, and said to be brought from the East Indies; he describes it as being of a purple or violet colour, but rarely very deep in the tinge. It seems to have been a species of amethyst.

JONÆ *pisces*, the *Jonas-fish*, a name given by many authors to the common shark, the *canis carcharias* of authors.

It has this name from an opinion that it was the fish which swallowed up the prophet of that name. But there are many objections to such an opinion.

JONAH, *or the Prophecy of* JONAH, a canonical book of the Old Testament, in which is related, that Jonah was ordered to go and prophefy the destruction of the Ninevites; but that disobediently attempting a voyage another way, he was discovered by the rising of a sudden tempest, and cast into the sea, where he was swallowed up by a whale. Having lodged three days and three nights in the whale's belly, he was disgorged upon the shore: wherenpon, being sensible of his past danger, and surprising deliverance, he betook himself to the journey and embassy to which he was appointed. Arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open to the inhabitants their sins and miscarriages, and proclaimed their sudden overthrow; upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin. *Jonah* was the most ancient of all the prophets whose writings are preserved in the Scripture canon. Some have supposed that he prophesied in the latter end of Jehu's or the beginning of Jehoahaz's reign, at which time the kingdom of Israel was brought very low by the oppressions of Hazael king of Syria. 2 Kings xiii. 22.

JONCTURE, or JOINTURE, the same with JOINT.

IONIC, in *Architecture*, the name of one of the five orders of columns. See *Tab. Archit. fig.* 26.

The first idea of the *Ionic* was given by the people of Ionia; who, according to Vitruvius, formed it on the model of a young woman, dressed in her hair, and of an easy, elegant shape: whereas, the Doric had been formed on the model of a strong robust man.

The *Ionic* column is the third in order, and is distinguished from the Composite, in that it has none of the leaves of acanthus in its capital; and from the Tuscan, Doric, and Corinthian, by the volutes or rams-horns, which adorn its capital; and from the Tuscan and Doric too, by the channels, or *fluting*, in its shaft.

This column is a medium between the massive and the delicate orders, the simple and the rich. Its height is eighteen modules, or nine diameters of the column taken at the bottom. When it was first invented, its height was but sixteen modules; but the ancients, to render it still more beautiful than the Doric, augmented its height, by adding a base to it, which was unknown in the Doric.

M. le Clerc makes its entablature to be four modules, and ten minutes, and its pedestal six entire modules; so that the whole order makes twenty-eight modules ten minutes.

It is said, the temple of Diana, at Ephesus, the most celebrated edifice of all antiquity, was of this order. At present, it is properly used in churches, and religious houses, and in courts of justice, and other places of tranquillity and devotion.

This order has one advantage above any of the rest; and it consists in this, that the fore and hind parts of its capital are different from the sides; but this is attended with an inconvenience, when the ordonnance is to turn from the front of the building to the side; to obviate which, the capital may be made angular, as is done in the temple of Fortuna Virilis. Scamozzi, and some other modern architects, have introduced the upper part of the Composite capital, in lieu of the *Ionic*, imitating that of the temple of Concord, whose four sides are alike: to render it more beautiful, the volute may be made a little oval and inclining. For the measures of the several parts of the *Ionic*, see COLUMN.

IONIC *architrave, base, capital, cornice, entablature, frieze, pedestal.* See the substantives.

IONIC *dialect*, in *Grammar*, a manner of speaking peculiar to the people of *Ionia*.

At first, it was the same with the ancient Attic; but passing into Asia, it did not arrive at that delicacy and perfection to which the Athenians attained: instead of that, it rather degenerated in Asia Minor; being corrupted by the admission of foreign idioms.

In this dialect it was, that Herodotus, Hippocrates, and Galen, wrote.

IONIC *sect* was the first of the ancient sects of philosophers.

The founder of this sect was Thales, who, being a native of Miletus, in Ionia, occasioned his followers to assume the appellation of *Ionic*.

It was the distinguishing tenet of this sect, that water was the principle of all natural things.

This is what Pindar alludes to in the beginning of his first *Olympic Ode*.

IONIC *transmigration* was heretofore a celebrated epocha, which took its rise from the retreat of the Athenian colonies; who, upon the death of Codrus, put themselves under the command of his son Neleus, and established the twelve cities of Ionia in Asia.

Those colonies, according to Eratosthenes, were established fifty years *after* the return of the Heraclidæ; and, according to Marsham, seventy-seven years after the taking of Troy.

IONKS, or JONQUES, in *Ship-building*, vessels very common in the East Indies, about the bignels of our fly-boats, but differing in form of building, according to the various methods of the nations in those parts.

JONQUIL, in *Botany*; see NARCISSUS.

JONTHLASPI, in *Botany*; see CLYPEOLA.

IO PÆAN, among the ancients, an exclamation used on account of a victory, or some prosperous event. Hoffman thinks that *Io Pæan* is a contraction of the Hebrew *Jeo*, from *Jehovah*, and הוֹדוּ, *refpexit*; and was the same with *Jehovah Pæneh*, i. e. *Domino refpicient in nos*. Something like this exclamation still remains among the Symeroners, a people of the West Indies, who on any joyful occasion frequently cry out *Ye Pake*.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts; the first of which is a history of the conquest of the land of Canaan; the second, which begins at the twelfth chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of seventeen, or, according to others, of twenty-seven years.

JOVIALE *arcanum*. See ARCANUM.

JOVIALE *hexaedrum*. See BEZOARDICUM.

JOURNAL, a day-book, register, or account of what passes daily. See DIARY.

JOURNAL, in *Merchants Accounts*, is a book into which every particular article is posted out of the waste BOOK, and made debtor. This is to be very clearly worded, and fairly engrossed. See *Journal* BOOK.

JOURNAL, in *Sea Affairs*, is a register kept by the pilot, and others, wherein notice is taken of every thing that happens to the ship from day to day, and from hour to hour, with regard to the winds, the rhumbs, the lake, soundings, &c. in order to enable him to adjust the reckoning, and determine the place where the ship is.

In all sea *journals*, the day, or what is called the twenty-four hours, begins at noon, and is counted thence twenty-four hours to the next noon: the first twelve hours, from noon to midnight, are marked with P. M. signifying after mid-day; and the second twelve hours from midnight to noon are marked with A. M. signifying after midnight: so that the ship account is twelve hours earlier than the shore account of time. There are various ways of keeping *journals*, according to the different notions of mariners concerning the articles that are to be entered. Some writers direct the keeping such a kind of *journal* as is only an abstract of each day's transactions, specifying the weather, what ships or lands were seen, accidents on board, the latitude, longitude, meridional distance, course, and run. These particulars are to be drawn from the ship's LOG-*book*, or from that kept by the person himself. Other authors recommend the keeping only of one account, including the log-book, and all the work of each day, with the deductions drawn from it. The form of this latter kind of *journal*, with an example of the work of a single day, is as follows:

Journal

Abſtract of a *Journal* from England towards Madeira.

Remarks on board.

M. 13th October.

Theſe twenty-four hours hard gales, and cloudy weather, accompanied with hard rains.

Handed fore-top ſails.

At 10 P. M. heard a gun at a diſtance.

At 2 A. M. ſaw to the N N E. ¼ E. the flaſh of a gun, and after fifty-ſix beats of the pulſe at the wriſt we heard the ſound, by which we judged the diſtance to be about eleven miles and a ſhip in diſtreſs. Bore away to ſpeak with her.

At ſix, having greatly over-run the diſtance, and finding nothing, concluded ſhe was gone down, ſo hauled our wind, and ſtood to the S W.

No obſervation this day.

Variation 1¾ point weſt.

JOURNAL is now become a common name for news-papers, which detail the daily tranſactions of Europe.

JOURNAL is alſo uſed for the title of ſeveral books which come out at ſtated times; and give abſtracts, accounts, &c. of the new books that are publiſhed, and the new improvements daily made in arts and ſciences.

The firſt *journal* of this kind was, the *Journal* des Sçavans, printed at Paris; the deſign was ſet on foot for the eaſe of ſuch as are too buſy or too lazy, to read the entire books themſelves. It ſeems an excellent way of ſatisfying a man's curioſity, and becoming learned upon eaſy terms; and ſo uſeful has it been found, that it has been executed in moſt other countries, though under a great variety of titles.

Of this kind are the Acta Eruditorum of Leipſic; the Nouvelles de la Republiques des Lettres of Mr. Bayle, &c. the Bibliotheque Univerſelle, Choiſie, et Ancienne et Moderne, of M. le Clerc; the Memoirs de Trevoux, &c. In 1692, Juncker printed, in Latin, an Hiſtorical Treatiſe of the Journals of the Learned, publiſhed in the ſeveral parts of Europe; and Wolfius, Struvius, Morhoff, Fabricius, &c. have done ſomething of the ſame kind.

The Philoſophical Tranſactions of London, the Memoirs of the Royal Academy of Sciences; thoſe of the Academy des Belles Lettres; the Miſcellanea Naturæ Curioſorum; the experiments of the Academy del Cimento; the Acta Philo-exoticorum Naturæ et Artis, which appeared from March 1686, to April 1687, and which are a hiſtory of the Academy of Breſlæ; the Miſcellanea Berolinenſia, or Memoirs of the Academy of Berlin; the Commentaries of the Academy of Peterſburgh, the Memoirs of the Inſtitute at Bologna, the Acta Literaria Sueciæ, the Memoirs of the Royal Academy of Stockholm, begun in 1740, the Commentarii Societatis Regiæ Gottingenſis, begun in 1750, &c. &c. are not ſo properly *Journals*, though they are frequently ranked in the number. Juncker and Wolfius give the honour of the firſt invention of *Journals* to Photius. His Bibliotheca, however, is not altogether of the ſame nature with the modern *Journals*; nor was his deſign the ſame. It conſiſts of abridgments, and extracts of books which he had read during his embaſſy in Perſia. M Salo firſt began the *Journal* des Sçavans at Paris, in 1665, under the name of the Sieur de Hedouville; but his death ſoon after interrupted the work. The Abbé Gallois then took it up, and he, in the year 1674, gave way to the abbé de la Roque, who continued it nine years, and was ſucceeded by M. Couſin, who carried it on till the year 1702, when the abbé Bignon inſtituted a new ſociety, and committed the care of continuing the *Journal* to them, who improved and publiſhed it under a new form. This ſociety is ſtill continued, and M. de Voyer has had the inſpection of the *Journal*; which is no longer the work of any ſingle author, but of a great number.

The other French *Journals* are the Memoirs and Conferences of Arts and Sciences; by M. Dennis, during the years 1672, 1673, and 1674; New Diſcoveries in all the parts of Phyſic, by M. de Blegny: the *Journal* of Phyſic, begun in 1684, and ſome others, diſcontinued almoſt as ſoon as begun.

Roziere's *Journal de* Phyſique, begun in July 1771, and continued to the preſent time 1780, in 19 vols. quarto.

The Nouvelles de la Republiques des Lettres, News from the Republic of Letters, were begun by M. Bayle in 1684, and carried on by him till the year 1687, when M. Bayle being diſabled by ſickneſs, his friends, M. Bernard and M. de la Roque, took them up, and continued them till 1699. After an interruption of nine years, M. Bernard reſumed the work, and continued it till the year 1710. The Hiſtory of the works of the Learned, by M. Baſnage, was begun in the year 1686, and ended in 1710. The Univerſal Hiſtorical Library, by M. le Clerc, was continued to the year 1693, and contained twenty-five volumes. The Bibliotheque Choiſie of the ſame author, began in 1703. The Mercury of France is one of the moſt ancient *Journals* of that country, and is continued by different hands: the Memoirs, or Hiſtory of Sciences and Arts, uſually called the *Journal* des Trevoux, from the place where they were firſt began in 1701. The Eſſays of Literature, which run to a twelfth volume in 1702, 1703, and 1704, only take notice of ancient authors. The Journal Literaire, by Eſther Hoge, began and ended in 1705. At Humburgh, they have made two attempts for a French Journal, but the deſign failed: an Ephemerides Sçavantes has alſo been undertaken, but that ſoon diſappeared. A *Journal* des Sçavans, by M. Dartis, appeared in 1694, and was dropt the year following. That of M. Chauvin, begun at Berlin in 1696, held out three years; and an eſſay of the ſame kind was made at Geneva. To theſe may be added, the *Journal* Literaire, begun at the Hague in 1715, and that of Verdun, and the Memoires Literaires de la Grande Bretagne, by M. de la Roche; the Bibliotheque Angloiſe, and *Journal* Britannique, which are confined to Engliſh books alone. The Italian *Journals* are, that of abbot Nazari, which laſted from 1668, to 1681, and was printed at Rome. That of Venice began in 1671, and ended at the ſame time with the other: the authors were Peter Moretti, and Francis Milletti. The *Journal* of Parma, by Roberti and Father Bacchini, was dropped in 1690, and reſumed again in 1692. The *Journal* of Ferrara, by the abbé

de la Torre, began and ended in 1691. La Galerio di Minerva, began in 1696. is the work of a society of men of letters. Seignior Apostolo Zeno, secretary to that society, began another *Journal* in 1710, under the protection of the grand-duke: it was printed at Venice, and several persons of distinction had a hand in it. The Fasti Eruditi della Bibliotheca Volante, were published at Parma. There has appeared since, in Italy, the Giornale dei Letterari.

The principal among the Latin *Journals* is that of Leipsic, kept under the title of Acta Eruditorum, begun in 1682: P. P. Manzani began another at Parma. The Nova Literaria Maris Balthici, lasted from 1698, to 1708. The Nova Literaria Germaniæ, collected at Hamburgh, began in 1703. The Acta Literaria ex Manuscriptis, and the Bibliotheca curiosa, begun in 1705, and ended in 1707, are the work of Struvius. Mess. Kuster and Sike, in 1697, began a Bibliotheca novorum Librorum, and continued it for two years. Since that time there have been many Latin *Journals*; such, besides others, is the Commentarii de Rebus in Scientia Naturali et Medicina gestis, by M. Ludwig. The Swiss *Journal*, called Nova Literaria Helvetiæ, was begun in 1702, by M. Sheuchzer; and the Acta Medica Hafniensia, published by T. Bartholin, make five volumes from the year 1673 to 1679.

There are two Low-Dutch *Journals*; the one under the title of Boockzal van Europe; it was begun at Rotterdam in 1692, by Peter Rabbus; and continued from 1702 to 1708, by Sewel and Gavern: the other is done by a physician, called Ruiter, who began in 1710.

The German *Journals* of best note are, the Monathlichen Unterredungen, which held from 1689 to 1698. The Bibliotheca curiosa, begun in 1704, and ended in 1707, both by M. Tenzel. The Magasin d'Hambourg, begun in 1748: the Physicaliche Belustigunzen, or Philosophical Amusements, begun at Berlin in 1731. The *Journal* of Hanover began in 1700, and continued for two years by M. Eccard, under the direction of M. Leibnitz, and afterwards carried on by others. The Theological *Journal*, published by M. Loescher, under the title of Altes & Neues, that is, Old and New. A third at Leipsic and Frankfort, the authors Mess. Walterck, Krause, and Grofchulius; and a fourth at Hall, by M. Turk.

The English *Journals* are, the History of the Works of the Learned, begun at London 1699. Censura Temporum, in 1708. About the same time there appeared two new ones, the one under the title of, Memoirs of Literature, containing little more than an English translation of some articles in the foreign *Journals*, by M. de la Roche; the other a collection of loose tracts; entitled, Bibliotheca curiosa, or a Miscellany. These, however, with some others, are now no more; but are succeeded by the Monthly Review, which began in the year 1749, and gives a character of all English literary publications, with the most considerable of the foreign ones: the Critical Review, which began in 1756, and is nearly on the same plan: besides these, we have several monthly pamphlets, called Magazines, which, together with a chronological series of occurrences, contain letters from correspondents, communicating extraordinary discoveries in nature and art, with controversial pieces on all subjects. Of these, the principal are those called, the Gentleman's Magazine, and the London Magazine, which both began about the year 1730.

JOURNCHOPPERS, in our *Old Writers*, regrators of yarn; which formerly, perhaps, was called *journ*. They are mentioned in the stat. 8 Hen. VI. c. 5.

JOURNEY, *Sabbath Day's*. See SABBATH.

JOURNEY-MAN, formed from the French *journée*, a day's work: anciently signified a person who wrought with another by the day; though now, by the statute, it extends to those likewise who covenant to work with another in their occupation or trade by the year.

JOULOPPED, in *Heraldry*, a term applied to the pills of a cock, when borne of a different tincture from his head.

JOY, in *Ethics*, is that passion which is produced by love, regarding its object as present, either immediately, or in prospect; in reality, or imagination. This passion has been found to increase the PERSPIRATION and urine of human bodies. See PLEASURE, and PAIN.

JOYNERS *Press*. See PRESS.

JOYNERY, the art of working in wood, and of fitting or joining various parts or members of it together.

The French call it *menuiserie*, from *minutaria*, small work; by which it is distinguished from *carpentry*, which is conversant in the larger and less curious work.

JOYNERY, *Column of*. See COLUMN.

JOZO, in *Ichthyology*, the name of a small sea-fish, of the sea-gudgeon, or rock-fish kind, common in the Medi-

terranean, and called *gobius albus* by some authors. It is brought to market at Rome and Venice.

IPECACUANHA, or IPECACOANHA, in *Pharmacy*, a little wrinkled root, about the thickness of a moderate quill, brought hither from several parts of the West-Indies; much used as an emetic, and against diarrhœas and dysenteries.

The first European who brought this root into use, was an apothecary of Brasil, whose name was Michael Tristaon. The book which this author published on this subject falling into the hands of the English, is translated into our language, and stands, among a number of like accounts, among Purchas's Pilgrims.

He says it is an excellent remedy against dysenteries and fluxes of all kinds. He says also, in its description, that the stalks are a quarter of a yard long, and the roots nearly as much; and that the leaves grow only four or five upon a plant.

This agrees very well with all that we have since discovered of this plant: and the method of using it at that time, we find, was not as a vomit; but they bruised the fresh root, and steeped it about twelve hours in water, at the end of which time the patient drank the water early in the morning: it operated by stool; but after its operation, the natural purging and voiding of blood ceased. This seems the original account we have of this drug. De Laet from this compiled his account; which is almost a literal translation of this into Latin: from his hint Piso and Marggrave enquired after it more carefully upon the spot, and from them came the first accurate accounts we had of it; so that all seems, *ab origine*, deduced from Michael Tristaon's account of it. Miller apprehends that the plant which furnishes the true *ipecacuanha* belongs to the genus of *trifolium*, or *faisle ipecacuanha*.

There are four kinds of *ipecacuanha*; viz. a *brown*, a *black*, a *grey*, and a *white* one: though only two, viz. the grey or ash-coloured and brown are met with in the shops. The grey is most esteemed in physic; though the brown is that the most used, as being easiest had:—this latter is firm, twisted, difficult to break, of a sharp bitter taste, and grows plentifully not far from Carthagena.—The root of the grey *ipecacuanha* is longer than any of the other sorts; it is also more violent in its operation: it comes from Peru, by the way of Porto-Bello. The Spaniards call it *ferruginho*.—The white *ipecacuanha* differs from the others, not only in colour but in figure too, being less twisted or rugged than they; and more resembling the root of white dittany. This grows in Brasil and Martinico.

There are divers false species of *ipecacuanha*, or roots, which, on account of their external appearance, bear the denomination of *ipecacuanha*, and are sometimes sold for it. Dr. Douglas mentions two: the one *white*, resembling the true white, only larger in size, straiter, and softer to the touch; the other *brown*, of a deeper colour than the true brown, and sometimes mixed with red, whence it has also been called *red ipecacuanha*.—These are both produced in Maryland and Virginia, where they are used as vomitives by the lower sort. Sir Hans Sloane has discovered, that the latter is no other than the root of a poisonous apocynum, described by him in his Natural History of Jamaica. See Phil. Trans. N° 410.

The genuine *ipecacuanha* has scarcely any smell, unless during its pulverization or infusion in liquors, when it emits a faint nauseous one. Geoffroy observes, that in pulverizing considerable quantities, the finer powder that flies off, is apt to affect the operator with difficulty of breathing, a spitting of blood, a bleeding at the nose, or a swelling and inflammation of the eyes and face, and sometimes of the throat; which symptoms go off in a few days, spontaneously, or by the aid of venæsection.

This root is the mildest and safest emetic that has yet been discovered. The common dose is from ten grains to a scruple, and upwards; though many instances occur of constitutions, on which two or three grains operated sufficiently. Where it fails as an emetic, it commonly purges; and fifteen grains of jalap, with two or three of *ipecacuanha*, have been found to purge more than twice the quantity of jalap by itself. This medicine has great efficacy in dysenteries, not only when used as an emetic, but when taken in such small doses as scarce to affect the grosser emunctories. In common cases it soon performs a cure, by bringing on a free diaphoresis or plentiful sweat, after the patient has taken a puke or two, and is covered up warm in bed. In putrid or malignant dysenteries, it requires to be continued for several days, and repeated as an evacuant, with the assistance of rhubarb, cordial antiseptics, and mild opiates or astringents. In cases requiring plentiful evacuation, or

when the offending matter is lodged deep, Sir John Pringle recommends it to be given in small doſes, and repeated at proper intervals, till vomiting or purging comes on. Pref.

The bark of *ipecacuanha* is ſaid to be preferable to its root, as an emetic; acting equally well, and with equal ſafety, in a ſmaller doſe, either in powder, or infuſion. Six grains of the bark, infuſed for a night in an ounce and a half of old Rhenith, proves a good emetic. See Phil. Tranſ. N° 476. ſect. 10.

The brown *ipecacuanha* yields, by diſtillation, a ſmaller quantity of oil than the grey; and the laſt portion of the ſpirit which comes over with the oil, on urging the fire to the greateſt violence, though it be conſiderably acid to the taſte, yet does not ſeem to contain leſs, but rather more volatile particles than the ſpirit drawn in the ſame manner from the grey. On mixing the ſpirits of both kinds alſo with ſalt of tartar, the volatile parts of that from the brown, eſcape with more rapidity than thoſe from the ſpirit of the grey, and affect the noſe more ſenſibly. It is rational to conclude from hence, that if the brown *ipecacuanha* contains leſs oil than the grey, it alſo contains leſs reſin; and that as this laſt portion of ſpirit contained more volatile parts, it muſt naturally be expected that it ſhould prove more violent in its operation than the grey. This obſervation alſo, which is countenanced by fact, may in ſome degree favour the opinion of thoſe who aſſirm, that the purgative virtues of medicines are excited by a volatile ſalt, and that they are more or leſs violent, as they contain more or leſs of this ſalt.

The brown *ipecacuanha*, as well as the grey, will afford two ſorts of extracts, a reſinous and a ſaline one; but both theſe are yielded in a ſmaller quantity from the brown than from the grey, and conſequently the *reſiduum* is always greater from the brown. Eight ounces of the grey *ipecacuanha* yield, with ſpirit of wine, ten drams of the reſinous extract; the ſame quantity of the brown treated in the ſame manner, yields only ſix drams. From the reſiduum of this quantity of the grey kind, thus diveſted only of its reſin by the ſpirit, there may be procured, by a watery ſolvent, two ounces of a ſaline extract; but the reſidue of the ſame quantity of the brown will yield only five or ſix drams of this extract, by the ſame treatment. The reſidue of the grey, thus diveſted of its reſinous and ſaline parts, will weigh four ounces; and the reſidue of the brown, after the ſame treatment, will weigh near ſix ounces. Hence it is very evident, that the active principles are much more abundant in the grey than in the brown kind of this uſeful root.

Neumann ſays, that ſixteen ounces of good *ipecacuanha*, will yield three ounces of reſinous matter, in which its virtue conſiſts, by means of ſpirit of wine; and from the ſame quantity, by means of water, five ounces of gummy matter were extracted.

If the proceſs of this analyſis be varied, and the watery menſtruum uſed firſt, the proportion of the ſaline extract will be greatly increaſed by it, and that of the reſinous greatly diminiſhed: eight ounces of the grey *ipecacuanha*, thus treated, yielding three ounces and a half of ſaline extract, and only thirty-ſix grains of the reſinous one afterwards by ſpirit of wine; and the ſame quantity of the brown yielding one ounce and three drams of the ſaline extract, and only twenty-four grains of the reſinous one, by means of ſpirit of wine afterwards uſed. From all this it is eaſy to perceive, that the brown *ipecacuanha* contains much leſs of the active parts, and much more of the terreſtrial than the grey; and yet it is equally certain from trial, that the brown is much more violent in its operation than the grey.

This ſeems a perplexing ſort of paradox; but to explain it we muſt remember, that the virtues of medicines are not to be meaſured by their bulk nor their weight, the moſt powerful of all acting in the ſmalleſt quantities. It has been obſerved, that the laſt portion of ſpirit drawn from the brown is more pungent and ſtrong than that from the grey; and probably this part of the root has as much power to irritate the internal parts of the inteſtines as the reſinous parts.

Small doſes of *ipecacuanha* are recommended in diarrhœas of a more ſimple kind, as well as in dyſenteries; and in the ſtout albus, we hardly know a better medicine. See Ulterius *Haemorrhoges*.

The beſt menſtruum for extracting the entire virtue of the root, appears to be a mixture of one part of pure ſpirit, with two or three parts of water. In the ſhops, wine is employed: an ounce of the root is macerated or digeſted in a pint of Canary or mountain, to which ſome add a quarter of an ounce of dried orange peel. Theſe tinctures, in doſes of from half an ounce, or leſs, to an ounce and upwards, prove mildly emetic. Lewis Mat. Med.

IPECACUANHA, *baſtard*, in *Botany*, is a ſpecies of ASCLEPIAS, or SWALOW-*wort*.

IPECACUANHA, *falſe*, or Dr. Tinkar's weed, *trioſteum*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower has a permanent empalement of one leaf, cut into five ſegments; it has a tubulous flower of one petal, with a ſhort brim, cut into five parts, which ſtand erect; and five ſlender ſtamina, the length of the tube, terminated by oblong ſummits; with a roundiſh germen, ſupporting a cylindrical ſtyle, crowned by a thick ſtigma; the germen afterward becomes an oval berry with three cells, each including one hard, three-cornered, obtuſe ſeed. There are two ſpecies.

Both theſe plants are natives of Virginia, and ſome other northern parts of America, where their roots have been frequently uſed as an emetic, and are commonly called *ipecacuanha*. One of the firſt perſons who brought the roots into uſe was Dr. Tinkar, from whence many of the inhabitants have called them by the name of Dr. Tinkar's weed. The leaves of the firſt ſort greatly reſemble thoſe of the true *ipecacuanha*, but the roots are of a different form. Miller.

IPECA GUACA, in *Ornithology*, the name of a Braſilian ſpecies of duck. It is of a middle ſize between the duck and gooſe and is kept tame there for breeding and eating. It will ſatten as well on dry land as when it has the uſe of water, and lays a vaſt number of eggs.

IPECATI *apoa*, in *Ornithology*, the name of a Braſilian ſpecies of duck called *pato* by the Portugueſe; the word in that language expreſſing gooſe. It is nearly of the ſize of the gooſe, but is exactly of the ſhape and figure of the common duck. It is very common in the Braſilian rivers, and is fleſhy and well taſted.

IPECU, in *Ornithology*, the name of a Braſilian bird of the wood-pecker kind, called by Mr. Ray, *picus varius Braſilienſis*. It is of the ſize of a common pigeon. Its beak is ſtraight, and very hard and ſharp, and it pierces the bark and wood of trees with it, in the ſame manner as the European kinds.

IPERAQUIBA, in *Ichthyology*, a name by which ſome have called the *remora*, or ſucking-fiſh, called alſo by the Portugueſe, *pixe pegador*, and *pixe piolho*.

IPOMOEA, ſee QUAMOCLIT.

IPPO, in *Natural Hiſtory*. See MACASSAR *Piſſon*.

IPPOSELINUM, or HIPPOSELINUM, in *Botany*, a name given by the ancients to the plant from the roots of which the fineſt myrrh was obtained by inciſion. Some alſo have called this plant *ſmyrnium*; but it is evident, that it could not be the ſame with the *hippoſelinum* or *ſmyrnium* of our authors, which is the herb Alexanders, ſince the juices of this plant have no reſemblance to myrrh. Dioſcorides calls the plant *ſmyrna*, and diſtinguiſhes it from the *ſmyrnium* of thoſe times; but others have made the *ſmyrna* and *ſmyrnium* the ſame.

IRACUNDUS *muſculus*, in *Anatomy*, a name given by ſome authors to one of the muſcles of the eye, called alſo the *rectus exterior* and *abducens*. It is one of the *quatuor recti* recti of Albinus, and is called by him and Douglas, as well as many others, the ABDUCTOR.

IRASCIBLE, in the *Old Philoſophy*, a term applied to an appetite, or a part of the ſoul, where anger, and the other paſſions, which animate us againſt things difficult, or odious, were ſuppoſed to reſide.

Of the eleven kinds of paſſions attributed to the ſoul, philoſophers aſcribe five to the *irascible* appetite; viz. wrath, boldneſs, fear, hope, and deſpair: the other ſix are charged on the concupiſcible appetite; viz. pleaſure, pain, deſire, averſion, love, and hatred.

Plato divided the ſoul into three parts; the reaſonable, *irascible*, and concupiſcible parts. The two [illegible] according to that philoſopher, are the corporeal [illegible] parts of the ſoul, which give riſe to our pa[illegible]. Plato fixes the ſeat of the *irascible* appetite [illegible] and of the concupiſcible in the liver; as the [illegible] of blood and ſpirits, which alone affect the [illegible].

IRENARCHA, ειρηναρχης, compoſed of ειρηνη, *peace*, from αρχω, *command*, a military [illegible] in the Greek empire, whoſe buſineſs was to provide for the peace, ſecurity, and tranquillity, of the provinces. In Juſtinian's code it is mentioned, that *irenarchæ* are ſent into the provinces to maintain the public peace, by puniſhing crimes, and putting the laws in execution.

Beſides this, there was another *irenarcha* in the cities, to whom belong the preſerving of peace, and quelling ſedition among the citizens. This officer was ſometimes called *præfectus urbis*.

The emperors Theodoſius and Honorius ſuppreſſed the office of *irenarcha*, on account of their abuſing their truſt, and diſtreſſing and perſecuting the people, inſtead of maintaining peace among them.

IRINGIUM, a name given by ſome of the old writers on the materia medica, to a root called *ſeſeli* by the Arabians, and which, from the ſimilitude of the Latin name with the word *eryngium*, many have ſuppoſed to be the ſame root which was well known to the Greeks and

and Romans in medicine; and ſtill is in great repute with us on the ſame occaſions.

It is poſſible that the *iringium* may be the ſame with the *ginging* or GINSENG, ſo famous in the Eaſt as this time for the ſame virtues.

IRIS, *rainbow*, in *Phyſiology*. The word is Greek, ιρις, ſuppoſed by ſome to be derived from ιρω, *I ſpeak*, *I tell*, as being a meteor that is ſuppoſed to foretel, or rather to declare, RAIN. See RAINBOW.

IRIS, in *Anatomy*, a ſtriped variegated circle round the pupil of the eye, formed of a duplicature of the uvea.

The *iris*, in different ſubjects, is of ſeveral very different colours, whence the eye is denominated *grey*, *black* &c. in its middle is a perforation, through which appears a little black ſpeck, called the *ſight*, *pupil*, or *apple of the eye*, round which the *iris* forms a *ring*.

When the aqueous humour of the eye is evacuated at a wound or ulcer of the cornea, there is danger of the *iris* growing to it. To prevent this, the patient is to be expoſed to the light from time to time, till the cornea is again raiſed by the aqueous humour. The light occaſions a motion in the *iris*, which may prevent its adheſion.

IRIS is alſo applied to thoſe changeable colours which ſometimes appear in the glaſſes of teleſcopes, microſcopes, &c. ſo called from their ſimilitude to a rainbow. The ſame appellation is alſo given to that coloured ſpectrum, which a triangular priſmatic glaſs will project on a wall, when placed at a due angle in the ſun-beams.

IRIS, *the flower de luce*, in *Botany*, a genus of the *triandria monogynia* claſs. Its characters are theſe: the flowers are incloſed in ſpathæ (or theaths), which are permanent; the flowers are divided into ſix parts, the three outer oblong, obtuſe, and reflected; the three inner erect, and ending in acute points; they have three awl-ſhaped ſtamina, which lie upon the reflected petals; under the flower is ſituated an oblong germen, which becomes an oblong angular capſule with three cells, filled with large ſeeds. There are nineteen ſpecies.

The Florentine dry *iris*, or orrice-root, is an expectorant and attenuant. It is given with ſucceſs in aſthmas, and many other diſorders of the breaſt and lungs. The doſe is from ten to fifteen grains in powder. It is uſed alſo in perfumes; in ſternutatory powders, and for communicating a grateful flavour, reſembling that of raſpberries, to wines and ſpirits. The juice of the freſh root of our *iris*, is an excellent medicine in dropſies; and the beſt way of giving it is with white wine, in doſes from one or two drams to three or four ounces, which muſt be taken every two or three days: is is a ſtrong irritating cathartic, works both by vomit and ſtool, and diſcharges a very great quantity of phlegm. The bluiſh expreſſed juice of the flowers changes, with the addition of a little lime-water, into a fine green; and it is thus directed in foreign pharmacopœias for tinging ſome of the unctuous compoſitions called odoriferous or apopleƈtic balſams.

We have a great many ſpecies of this plant preſerved in gardens, and moſt of them are very beautiful; their roots are tuberous and increaſe very faſt, and all the ſpecies are eaſily propagated by parting them. The beſt ſeaſon for doing which, is in Auguſt, when their flower-leaves are decayed, and the whole plant begins to change colour; but this ſhould always be done when the weather is moiſt, ſo that if the month of Auguſt ſhould prove very dry, it ſhould be deferred till September, though it is beſt to do it ſooner if it can be. They all love a ſhady and moiſt place. If too much dung is uſed to the ground, it rots their roots; and if they ſtand expoſed to the ſun, their flowers are but of very ſhort duration. They ſhould be taken up once in two years, to prevent their extending their roots too far, for they are apt to ſpread, and to harbour all ſorts of vermin.

The curious may raiſe the ſeveral ſpecies from their ſeeds; which if taken from the choiceſt flowers, and cultivated with care, uſually afford a fine variety in the flowers of the plants they produce. They ſhould be ſown ſoon after they are ripe, on an eaſt border: they will come up in ſpring, and the year following will flower. Miller.

Bulbous IRIS, *xiphion*, in *Botany*; this is a ſpecies of *Iris* in the Linnæan ſyſtem. Its characters are theſe: the flowers have each a permanent ſpatha or ſheath, and have ſix petals, the three outer broad, obtuſe, and reflexed, and the inner erect, pointed, and joined to the other at their baſe; they have three awl-ſhaped ſtamina, which lie upon the reflexed petals, and are terminated by oblong depreſſed ſummits; and an oblong germen under the flower, ſupporting a ſhort ſtyle, crowned by a tripartite ſtigma. The germen becomes an oblong angular capſula with three cells filled with roundiſh ſeeds.

We have ſeveral ſpecies of this beautiful plant cultivated in our gardens, where they are called *bulbous iriſes*; and beſides theſe, a vaſt number of varieties or new flowers, as the floriſts call them. The culture of theſe being the ſame with that of ſeveral other plants of the ſame ſort, which are much valued for their flowers, it may not be amiſs to give it at large.

There ſhould be great care to ſave the ſeeds of the fineſt and ſtrongeſt flowers, and in September ſome ſhallow pans or boxes muſt be placed with holes at their bottoms to let out the moiſture, and then filled with light and fine earth. On this the ſeeds muſt be ſown pretty thick, and as evenly as may be; half an inch of the ſame earth muſt be ſifted on theſe, and the boxes muſt then be ſet where they may have the morning ſun; and if the weather proves very dry, they muſt be gently watered at times. They muſt remain in this ſituation till October, and then muſt be removed to a place where they may have the benefit of the ſun as great a part of the day as may be; here they muſt ſtand the winter, keeping the boxes very carefully clear from weeds.

In the ſpring the young plants will appear, and they ſhould then be removed to their firſt ſituation, where they may have only the morning ſun; and if the weather be dry, they muſt be watered at times. In June their leaves will decay, and they muſt then have half an inch of freſh earth ſifted over them, and be left in their ſituation till October, when they muſt be removed to the ſame place as before for the winter.

In the ſpring the leaves will appear again, and when they are again periſhed, the earth muſt be taken out of the boxes, and ſifted to ſeparate the roots, which muſt then be planted at three inches diſtance on a bed of the ſame light earth; they muſt be buried three inches deep, and in the ſpring following muſt have about half an inch of freſh earth ſifted over them; the leaves will this year appear and decay as before; and the following year, in June, they will moſt of them flower, when the fineſt flowers ſhould be marked, that their roots may be taken particular care of. The following year the remainder, which did not flower at firſt, will produce their flowers; ſuch of theſe as are finer than the reſt, ſhould be marked in the ſame manner, and the roots of theſe choice kinds be preſerved with particular care. Whatever fine or new flower is thus raiſed from ſeed, may be afterward propagated by off-ſets from roots, which being planted out, will flower the ſecond year, and often produce even finer flowers than the mother-root.

The roots of theſe flowers ſhould be taken out of the earth only every other year; this ſhould be done juſt when the leaves are decayed, and they ſhould not be kept out of the earth above a fortnight.

The earth in which theſe flowers thrive beſt, is a light ſandy loam; and if it be taken up with the turf and the graſs rotted among it before it is uſed, it will be ſo much the better. They do not delight in a rich dunged ſoil, nor ſhould they be placed where they are too much expoſed to the ſun; for beſides that the flowers ſoon fade in theſe places, the roots are alſo always found to decay: but in an eaſt border, where they may have the ſun till eleven o'clock, and where the ground is not too moiſt, nor over dry, they will ſtand a long time in flower, and thrive extremely well.

IRIS *lutea paluſtris*, the *yellow flag-flower*, is a ſpecies of *iris* which grows naturally in ditches and moiſt places, in moſt parts of this country. The common people of Scotland have found out an uſe of this plant, which has eſcaped the moſt accurate writers on botany. In that country the common ink is made of it. They cut ſome of theſe roots into thin ſlices, and either boil or infuſe them in water till the liquor is highly tinged with them; they then pour it clear off; and then putting into it the blade of a knife, or any other piece of iron, they rub it hard with a rough white pebble, common there, and by degrees the liquor becomes black; they continue rubbing it till it is as deep a black as they require, and it is a tolerable good ink. Phil. Tranſ. N° 117.

The juice of this plant mixed with ſyrup of buckthorn, is reckoned an effectual hydragogue. See Med. Eſſ. Edinb. vol. v. art. 8.

The root of this plant is recommended by Brookes as a remedy for the tooth-ach.

IRIS is alſo a name given by ſome authors to a peculiar ſpecies of ſprig cryſtal, remarkable for its giving the rainbow colours in reflection. This, however, being a property more or leſs found in all the kinds of ſprig cryſtal, and theſe much reſembling one another, it became applied to ſprig cryſtal in general; and *iris*, inſtead of being the name of a peculiar ſpecies, was underſtood as a ſynonymous term for common cryſtal.

IRIS *marina*, the *ſea-rainbow*. This elegant appearance is generally ſeen after a violent ſtorm, in which the ſea-water has been in vaſt emotions. The celeſtial rainbow has great advantage over the marine one in the brightneſs and variety of the colours, and in their diſtinƈtneſs

one

one from the other; for in the sea-rainbow there are scarce any other colours than a dusky yellow on the part toward the sun, and a pale green on the opposite side. The other colours are not so bright or so distinct as to be well determined, but the sea-rainbows are more frequent and more numerous than the others. It is not uncommon to see twenty or thirty of them at a time at noonday. Observ. sur l'Afie, p. 292.

IRISH *Terms*. See TERMS.

IRON, in *Natural History*, a hard, fusible, and malleable metal, of a grey ish colour, of great use in the affairs of life.

Iron, like other metals, is said to consist of earth, PHLOGISTON, and a metallic or mercurial principle. This metal has, next to GOLD, the greatest tenacity of parts: an *iron* wire, the diameter of which is 1-10th of an inch, being capable of sustaining 450 lb. without being broken.

It is the lightest of all metals, except tin, being between seven and eight times specifically heavier than water. See *Specific* GRAVITY. It is also the hardest, most elastic, and, except PLATINA, and MANGANESE, the most difficult to melt, of all metallic substances.

Though *iron* grows red-hot much sooner than any other metal, it is not fusible by the heat of ordinary furnaces, nor without an intense white heat. When perfectly malleable, it is said not to be fusible at all, without additions, or the immediate contact of the burning fuel; and when melted, to lose its malleability: but M. Reaumur found, that forged *iron*, which could not be made to melt in a crucible without addition, was brought into fusion by surrounding it with GYPSUM or plaster of Paris; and Dr. Lewis found that *iron*, thus melted, proved very malleable, though some have thought that forged *iron*, brought into fusion, is of the same nature with common cast *iron*. *Iron* expands the least of the metals by heat; and in the act of fusion, instead of continuing to expand, like the other metals, it shrinks; and in its return to a consistent state, instead of shrinking, like the other metals, it expands or dilates into a large volume; and one of the marks of this dilatation is, the convexity of its surface, in circumstances wherein that of other metals is depressed. This property of *iron*, first discovered by M. Reaumur, excellently fits it for receiving impressions from moulds: but Dr. Lewis observes, that platina seems to destroy this power in *iron*. He also observes, that platina, melted with cast *iron*, contributes to render it tough, probably by throwing out and consuming that sulphureous matter, to which the brittleness of this kind of *iron* is chiefly owing, and which is separated in the process by which *iron* is made malleable: and, therefore, he conjectures, that platina, for certain purposes, may prove a valuable addition to this most useful metal, to which the workmen cannot communicate the hardness that is often required, without imparting at the same time brittleness and intractability. *Iron*, exposed to a white heat insufficient for its fusion, is calcined first into blackish scales, and afterwards into a dark reddish powder, called CROCUS *martis aftringens*, which is nothing but the proper earth of *iron*, deprived of the greatest part of its phlogiston by calcination. When strongly heated, the surface of *iron* appears covered with a soft vitreous matter, like varnish; in this state, pieces of it cohere and on being hammered together, weld or unite without discovering a juncture. As *iron* is the only metal which exhibits this appearance in the fire, it is likewise the only one capable of being welded. *Iron* heated as much as possible, or till it becomes of a shining white colour, and is just beginning to fuse, has the appearance of a combustible body; penetrated by a bright and vivid flame; and the inflammable principle of this metal thus heated, really burns in a sensible manner; a number of shining sparks shooting out from it, and burning with a kind of decrepitation. *Iron* appears to be a combustible substance, from the great loss or waste of quantity observable in it, when exposed to a red, and especially to a white heat: and this COMBUSTION is excited and maintained like that of other combustible substances, by contact of air. The sparks produced by the collision of steel with FLINT, appear to be globular particles of *iron*, which have been fused, and imperfectly fcorified or vitrified. The ignition, light, and fusion of the sparks, are occasioned by the heat excited by the combustion of their own inflammable matter, and continued in these particles during their passage through the air, and not merely by the heat communicated by the collision; for by an experiment of Mr. Hawkbee, it appears, that these sparks struck by collision, are not visible, that is, they are not ignited, and do not deflagrate in an exhausted receiver: the air being necessary to maintain and excite their deflagration and combustion. *Iron*, like other calcinable metals, acquires an increase of weight by CALCINATION: and, by complete calcination, it is said to receive an augmentation of one third of its weight. *Iron* may be softened by heating it often in the fire, hammering it, and letting it cool of itself; and it is hardened by extinguishing it in water.

It may be rendered white by cooling it in sal ammoniac and quicklime. The strongest temper of *iron* is said to be that which it takes in the juice of earthworms.

The furface of *iron* is quickly corrofible by moift air, and foon converted into a reddifh yellow ruft, or calx, deprived of all its phlogiston, and which cannot recover its metallic properties, without being again combined with its inflammable principle. Many methods have been ufed to preferve *iron* unfullied from ruft; as animal fats, oils, boiled oil mixed with melted lead, &c. Homberg's falve for this purpofe, confifts of two pounds of hog's lard, an ounce of camphor, and as much black lead as will render the mixture of an *iron* colour: when this is ufed, the *iron* muft be previoufly heated. M. Reaumur has difcovered a better compofition for this purpofe: it is oil, infpiffated by being expofed to the air in flat fhallow veffels, fo as juft to cover the bottom, mixed with a folution of copal in fpirit of wine; this forms an elegant hard varnifh, which, rubbed on polifhed *iron*, made a little hotter than the hand can bear, will cover it with a folid, thin, tranfparent coat, without any injury to its colour or appearance. *Iron* is foluble in all acids, from which it precipitates all the common metallic bodies except zinc, and the femi-metals, regulus of cobalt and nickel: with the marine acid it yields a yellow: with the nitrous, a dark red, forming with thefe acids, feparately or conjointly, falts with metallic bafes, of a deliquefcent nature; and with the vitriolic, a pale green folution, that forms a vitriolic falt with a metallic bafe, coagulated by evaporation and cooling into green rhomboidal cryftals, and which is changed to an inky blacknefs by the addition of a fmall quantity of galls, and by moft of the other vegetable aftringents; and to a reddifh or purple, by a mixture of aftringents with a minute proportion of any alkaline falt. Each of thefe acids deprives the *iron*, in the folution, of a confiderable part of its phlogiston, or inflammable principle. During the folution in vitriolic acid, an inflammable vapour arifes; which is permanent and elaftic, and which has a great analogy to the inflammable DAMPS in mines. All the folutions of *iron*, by whatever acid effected, on the addition of a lixivium of alkaline falts that have been calcined and fully impregnated with animal coals, are changed to a deep blue, and on ftanding depofit the *iron* in form of a powder of the fame colour. By thefe characters, a moft minute portion of *iron* may be difcovered in liquors. *Iron* has a greater affinity than any other metal with fulphur; and, therefore, may be employed to feparate moft metals from fulphur by fufion; and fulphur, thus united with *iron*, confiderably augments its fufibility. If a bar of *iron* be heated till it becomes white, and a roll of fulphur be applied to one of its extremities thus heated, the fulphur uniting with the *iron*, makes it fufe fo as to run down in red-hot drops. See *Artificial* EARTHQUAKES.

Iron has a great conformity with copper; and the two are not eafily feparated, when foldered together: whence arifes that uncommon friendfhip which the poets feign between Mars and Venus.

Gold is alfo particularly difpofed to unite with *iron*, of which, if the *iron* be pure, it diffolves twice or thrice its own weight in a degree of heat far lefs than that in which *iron* melts. In virtue of this property, gold proves an excellent folder for the finer kinds of [illegible] fteel inftruments; a fmall thin plate of gold [illegible] pod round the parts to be joined, the gold [illegible] to melt by a blow-pipe, and ftrongly unites [illegible] together. *Iron* and fteel, in very fmall proportion [illegible] der gold hard and eager; fome of thefe mixtures [illegible] fuch a degree of hardnefs and clofenefs, as adapt [illegible] for receiving a fine edge, and it is faid they have been formed into razors. For the method of gilding *iron*, fee GILDING.

Iron is diffolved by all the metals made fluid by fufficient heat, except lead, on which it floats diftinct, as oil upon water. Among the femi-metallic bodies, it is averfe to any union with mercury; no method has been hitherto difcovered of amalgamating *iron*; though quickfilver, in certain circumftances, feems in fome fmall degree to act upon it: a plate of rough *iron*, kept immerfed in mercury for fome days, becomes brittle; and mercury has been obferved to adhere to, and coat the heads of *iron* peftles ufed in triturating certain amalgams with faline liquors. *Iron* filings may be amalgamated with mercury when the folution of green vitriol is added. See AMALGAMATION *of iron*. For the affinities of *iron* with different fubftances, fee Tables of AFFINITY.

It

It has a great conformity alſo with the loadſtone, being attracted by magnets. Robault obſerves that it is itſelf an imperfect loadſtone; and that if it be a long time expoſed in a certain ſituation, it becomes a real loadſtone; and mentions the *iron* in the ſteeple of Notre Dame at Chartres as an inſtance.

By this property, it may be diſcovered in mixtures, where by other methods it could ſcarcely be perceived, and may be even ſeparated when it is only interſperſed betwixt other bodies, and not adherent to them. It preſerves this property, although it be allayed with ſome other metals. However, Gellert affirms, that this quality is deſtroyed by allaying *iron* with regulus of antimony.

It is obſervable, that ſeveral of the hard ores of *iron*, which are not affected in the leaſt by the magnet in their natural ſtate, are vigorouſly attracted by it when moderately roaſted, though without the contact of any inflammable, and without ſeeming to loſe any ſulphureous matter; and that the calces of *iron*, by ſlight roaſting with inflammable additions, are made to obey the loadſtone, and revived into their metallic form, each particle appearing now to be perfect *iron*; whilſt the calces of other metals are in no degree revived without being brought into fuſion.

The ſeveral calces of *iron*, fuſed with large proportions of vitreous matters, impart different ſhades of yellow, reddiſh, green, and blue: and the colour, ſays Dr. Lewis, ſeems to be influenced more by the degree and continuance of the fire, and other circumſtances in the proceſs, than by the particular manner in which the *iron* is prepared.

Moreover, *iron* is capable of being combined either by fuſion, or by cementation, with a more abundant quantity of phlogiſton; and of being thus converted into a more perfect *iron*, called STEEL, which is capable of acquiring, by ſudden cooling or tempering, a very great hardneſs, that renders it uſeful for many neceſſary purpoſes.

It would ſcarce have been believed, till experiments confirmed it, that *iron* makes a part of almoſt all ſorts of ſubſtances. So that it is truly an univerſal metal, being found in all the mineral earths and ſtones that have been examined, in the ores of all other metals, and even in the aſhes of all vegetables and animals. Mr. Geoffroy attempting to produce *iron* by chemiſtry out of ſeveral ingredients, into which it may be decompoſed, wanted firſt to find ſuch as in themſelves contained no *iron*. He found that the aſhes of all vegetable bodies whatever, contained more or leſs of that metal; and Mr. Lemery afterwards, in his analyſis of honey, found *iron* in the calcined caput mortuum of that ſubſtance, many particles of it adhering to a knife that had been touched on a magnet.

This had much puzzled the thoughts of the chemiſts, when Mr. Lemery at length attempted to account for it in this manner. All earth is impregnated with a ferruginous and vitriolic matter, and this therefore muſt be received into the roots of plants in their growth, and make a part of their ſubſtances. It is however, in too ſmall a quantity, and in particles too much diſſeminated, to ſhew itſelf in the ſtalks or leaves of the plant; but when the whole has been calcined, the fire collecting together its ſeparated particles, they then form ſmall maſſes which act as *iron*, and apply themſelves to the magnet.

Beſides, particles of *iron* are diſcovered by the magnet, not only in all vegetable aſhes, but in animal ones; the aſhes of caſtor have been found by the younger Lemery to contain alſo *iron* in as large a proportion as thoſe of honey and of vegetables.

To try whether theſe particles attracted by the magnet in the aſhes of vegetables were really *iron*, this author collected a ſmall quantity of them together by means of a knife touched on the magnet, and expoſing them to the focus of the great burning glaſs belonging to the then duke of Orleans, they were found to be melted by that heat in the ſame manner as common *iron*, and to be attended with all the ſame circumſtances in the ſeveral ſtates of fuſion and diſſipation. It ſparkled greatly while ſoft, and finally was reduced to a ferruginous earth or bole, in all reſpects the ſame with that ſeparated by the ſame means from filings of *iron*, or from the magnet. When this matter is thus proved to be real *iron*, the doubt how it is able to get into the minute veſſels of plants, is cleared, by conſidering that *iron* is not only preſent in all earth, but is alſo very eaſily diſſolved by all ſorts of ſalts, and takes different forms with every one, according to its peculiar nature. When it is found in earths which contain an acid analogous to that of vitriol, ſulphur, or alum, it becomes converted into a ſalt known by the name of vitriol; and what objection can there be againſt the ſuppoſing that this ſalt, when diſſolved in a ſufficient quantity of water, is received into the veſſels of plants growing in the earth where it abounds; and we cannot doubt the diviſibility of the particles of *iron* in the ſtate of this ſalt, being great enough to make it capable of paſſing even into the moſt minute veſſels of plants, when we conſider that a grain of vitriol diſſolved in nine thouſand times its own weight of water, is capable of giving colour to the whole, and with it a ſenſible taſte of the metal from which it had its origin.

The ſpecific gravity of *iron* has been by ſome ſuppoſed to be a reaſon againſt the believing its aſcent in the veſſels of plants; but this appears of no weight, when we conſider that all flowers are found, on a chemical analyſis, to contain earth, and that earth is heavier than *iron* in the ſtate of vitriol; and that the metals in the ſtate of vitriols, do often riſe in vapour, and that without any great heat, in plain from this experiment, that if blue, green, and white vitriol be put together into a box, and covered down, the natural evaporations of each falling conſtantly on the others, will change the colour of every one on their upper ſurface, while that which touches the bottom of the box remains unaltered. If vitriol be put into an earthen veſſel, and water poured on it in ſmall quantity only to moiſten it, the *iron* loaded with its acids, will be found in a little time to aſcend up the ſides of the pot to the top. This is a ſecond proof that *iron* in the ſtate of vitriol is to be raiſed or ſublimed with great eaſe. There is, however, beſides theſe, yet another more convincing.

When ſpirit of nitre is poured upon filings of *iron*, there ariſes an ebullition attended with ſo great heat that the hand can ſcarcely be held upon the outſide of the veſſel. After the ebullition the liquor becomes red, and greatly loaded with the diſſolved *iron*. If oil of tartar be added to this liquor, there is raiſed a moderate ebullition, and the mixture ſwells greatly. After this there are found a number of branches very beautifully arranged on the ſides of the veſſel, and theſe continue to form themſelves under the eye, while there is no fermentation nor ebullition in the liquor. Theſe curious figures at length cover the whole ſurface of the veſſel, and riſing over the rim of it, fall on the outſide, and cover that alſo. This beautiful vegetation may be varied a great many ways by the different proportions of the ingredients; but in every proceſs it ſhews how very eaſily *iron* may be made to aſcend upwards, and that to great heights; and when we conſider the power of the heat of the ſun, and of the ſuction of the roots of plants, which are in a manner ſo many ſyphons acting together upon the juices of an earth, among which there are particles of *iron* thus diſſolved; we are not to wonder that *iron* is conveyed into the veſſels of the plant, or found afterwards in its aſhes. The wonder would be that there ſhould be any vegetable aſhes which did not afford *iron*, but that does not appear yet to have been found in regard to any. Mem. Acad. Par. 1706.

The qualities of *iron*, with regard to hardneſs, brittleneſs, malleability, &c. are different according to the nature of the ore from which it is obtained, and the operation it has undergone. The *iron* run from ſome of the German ores, when forged only to a certain point, is found to be good ſteel; whilſt that of many others, taken in the ſame intermediate ſtate, betwixt caſt and completely forged *iron*, cannot be worked either as ſteel or *iron*. The Swediſh, and ſome of our own ores, yield an excellent tough *iron*; whilſt others give a brittle metal, that cannot by any forging be made perfectly malleable, and hence employed only for ſome kinds of nails and heavy works. The inferior ores are ſaid to be meliorated by mixing two or three different ſorts together. The Swediſh *iron* has generally been preferred on many accounts, and particularly for making of ſteel; but the Engliſh *iron*, properly manufactured, has been found not inferior to it. The German *iron*, commonly called among us, *Dort-ſquare*, becauſe it is brought hither from Dort, and wrought into bars of three quarters of an inch ſquare, is a coarſe *iron*, and only fit for ordinary uſes. That ſort which is uſed for the making of WIRE, is the ſofteſt and tougheſt of all, and acquires theſe qualities from being refined to a higher degree than is neceſſary for ordinary purpoſes.

Generally ſpeaking, the beſt *iron* is that which is ſofteſt and tougheſt, and which, when it breaks, is of an even greyiſh colour, without any glittering ſpecks, or any flaws or diviſions like thoſe ſeen in broken antimony.

IRON, *bar*. See BARS of *Iron* and ANCONY.

IRON, *caſt*, is that which is run from the ore, and which, on account of a mixture of crude earth, not reduced to a metallic form, proves hard, ſo as generally not to yield in the leaſt to the file or chiſſel; and brittle, both whilſt cold and when ignited. When caſt into thin plates, it cracks on being haſtily cooled, like glaſs; and

when broke, appears of a dull white colour, approaching to that of unpolished silver, and of a smooth uniform texture, composed of plates laid so close together, as scarce to be distinguishable, even by a microscope. The more impure sorts are less hard to the file, but not less brittle under the hammer; their colour is much darker, and their texture often granulated. When they are melted, a quantity of glassy scoria arises on the surface, and leaves the remaining metal pure and white like the foregoing sort. Pure cast *iron*, surrounded with animal ashes, and exposed to a fire not sufficient to melt it, becomes by degrees so soft, that utensils or ornaments made of it may be easily cut and filed. During this cementation, it undergoes several remarkable changes, observed by M. Reaumur, and recited by Dr. Lewis in his notes to Newmann's Chemistry, p. 79.

IRON, *forged*, is produced from cast *iron*, heated till it is ready to melt, and compressed by repeated blows of large hammers; by which a quantity of vitreous matter is forced out and thrown off; its parts are more regularly arranged; the plates rendered smaller, and more distinct, by degrees changed into grains, and at length into fibres. Fine plates regularly arranged, small grains or fibres like those which appear on the fracture of wood, are marks of tough *iron*, provided it be not sulphurated; but large and irregular plated *iron* is universally short and brittle, and the colour of the fracture is usually whitish, and considerably bright. Pure well-forged *iron* is malleable both when cold and *hot*, though not with equal facility: the more it is heated, it extends the more easily, and is less liable to crack. Some sorts of *iron*, though malleable when cold, prove entirely brittle if heated red; others are brittle when cold, and malleable *only* whilst ignited. The former are called by the workmen, *red-short*, or *red-sear*, the latter, *cold-short*, or *cold-sear iron*. The imperfection of the first is supposed to be owing to an admixture of sulphur; that of the second proceeds wholly from a want of sufficient forging. Forged *iron* is a little heavier than the cast, in the proportion of about 7 to 7. It scorifies much more in the fire, and does not melt without additions, or the immediate contact of the fuel: the sublances, says M. Reaumur, that soften cast *iron* by cementation, increase the softness of the forged to a certain point; but beyond this, the operation renders it harder and more brittle than at first. See Dr. Lewis, &c. ubi supra.

Square and flat bars of *iron* are sometimes twisted, for ornament; the manner of doing which is this: after the bar is square, or flat-forged, they give it a flame-heat, or if the work be small, only a blood-red heat; in which state it is *easy* to twist it about as much or as little as they *please*, with the tongs, vice, or the like.

The several heats which smiths give their *iron* in work are, 1. A sparkling or welding heat, which is used when they double up their *iron*, or weld two pieces of *iron* together, end to end. 2. A flame or white heat, which is used when the *iron* has not its form and size, but must be forged into both. 3. A blood-red heat, which is used when the *iron* has already its form and size, but wants a little hammering to smooth and fit it for the file.—If the *iron* be made too hot, it will sometimes rod-sear, i. e. break or crackle under the hammer while it is working between hot and cold.

We have a great number of *iron* works in most parts of England, and in Wales; those in the forest of Dean, in Gloucestershire, are in most repute.

The ore is there found in great abundance, differing much in colour, weight, and goodness. The best, called *brassy ore*, is of a bluish colour, very ponderous, and full of little shining specks, like grains of silver: this affords the greatest quantity of *iron*, but, being melted alone, it produces a metal very short and brittle, and therefore not fit for common use. For the remedying whereof, the workmen make use of another sort of material, termed *cinder*, which is nothing but the refuse of the ore, after the metal has been extracted; and which, being mingled with the other, in a due quantity, gives it that excellent temper of toughness, which causes this *iron* to be preferred before any brought from foreign parts.

It is asserted by a person conversant with the manufacture of *iron*, that if a sufficient quantity of this cinder were carried to the *iron*-works in any other part of the kingdom, and made use of instead of the lime-stone, the *iron* produced will be nearly, if not equally, as good as that of the forest of Dean. The same writer observes that in Staffordshire, and various parts of Yorkshire, where their *iron* is but of an indifferent quality, the matter made use of by way of flux, was generally unburnt lime-stone, which he thinks by no means proper for the purpose: in Sussex they use a certain fossil, composed of a congeries of different shells of fishes, slightly bound together by a sort of reddish earth, not unlike some kinds of *iron ore*, called greys; which, he says, is a good flux, and produces a metal of excellent quality. Horne's Essay on *Iron* and Steel, p. 56, &c. But to return to the account of the manufacture of *iron* in the forest of Dean, which is similar to that pursued in other parts of the kingdom.—After they have provided the ore, their first work is to calcine it, which is done in kilns, much after the fashion of our ordinary lime-kilns: these they fill up to the top with coal and ore, stratum super stratum, that is, one layer upon another: and so putting fire to the bottom, they let it burn till the coal be wasted, and then renew the kilns with fresh ore and coal, in the same manner as before. This is done without fusion of the metal, and serves to consume the most drossy part of the ore, and to make it brittle; supplying the beating and washing which are used in other metals.

From hence they carry it to be smelted to their furnaces, which are built of brick or stone, and are about twenty-four feet square on the outside, and near thirty feet in height within; not above eight or ten feet over where widest, which is about the middle: the top and bottom having a narrow compass, much like the shape of an egg. Behind the furnace are fixed two huge pair of bellows, the noses of which meet at a little hole near the bottom: these are compressed together by certain buttons, placed on the axis of a very large wheel, which is turned about by water, in the manner of an over-shot mill. As soon as these buttons are full off, the bellows are raised again by the counterpoise of weights, whereby they are made to play alternately, the one giving its blast whilst the other is rising.

At first they fill the furnace with ore and cinder, intermixed with fuel, which in these works is always of charcoal, laying them hollow at the bottom, that they may more easily take fire; but after they are once kindled, the materials run together into a hard cake or lump, which is sustained by the fashion of the furnace: and through this the metal, as it melts, trickles down into the receivers set at the bottom, where there is a passage open, by which the men take away the scum and dross, and let out the metal as they see occasion. Before the mouth of the furnace there lies a great bed of sand, wherein they make furrows of the shape into which they would have their *iron* cast. As soon as the receivers are full, they let in the metal, which is made so very fluid by the violence of the fire, that it not only runs to a considerable distance, but stands afterwards boiling for a good while.

For the backs of chimneys, hearths of ovens, or the like, they take the melted metal out of the receivers in great ladles, and pour it into moulds of fine sand.

When the furnaces are once at work, they keep them constantly employed for many months together, never suffering the fire to slacken night or day, but still supplying the wasting of the fuel, and other materials, with fresh poured in at the top: charcoal is used altogether in this work; sea-coal will scarcely do. See IRON-ORE and FURNACE.

From these furnaces the workmen bring their *sows* and *pigs* of *iron*, as they call them, to their forges, one of which they call the FINERY, and the other the CHAFERY, where they are wrought into bars. Phil. Trans. N° 137. Abr. vol. ii. p. 558.

IRON, *duties upon*. Any Spanish, Spruce, and Swedish *iron* imported in any other ship or vessel than such as is English built, and of which the master, and at least three-fourths of the mariners are English, pays on importation, 2l. 17s. 10,5/6d. the ton, and draws back on exportation, 2l. 14s. 6,5/6d. the same imported in English-built ships, and so navigated, to pay on importation, 2l. 8s. 6,5/6d. the ton, and draw back on exportation, 2l. 5s. 2,1/2d. *Iron* slit or hammered into rods, commonly known by the name of *rod-iron*, pays on importation, 8s. 6,1/2d. the hundred wt. and draws back on exportation, 8s. 3,1/2d. Ditto from Ireland, pays 3s. 10,1/2d. and draws back, 3s 4,1/2d. *Iron* drawn or hammered less than three-fourths of an inch square, pays on importation 8s. 6,1/2d. the hundred wt. and draws back on exportation, 8s. 3,1/2d. Unwrought *iron* of Ireland, pays on importation, 1l. 6s. 11,1/2d. the ton, and draws back on exportation, 1l. 3s. 7,1/2d. Unwrought *iron* of all other places, not otherwise rated, imported in British ships, pays on importation, 2l. 8s. 6,1/2d. the ton, and draws back on exportation, 2l. 5s. 2,1/2d. and in foreign ships, pays on importation, 2l. 17s. 10,1/2d. and draws back on exportation, 2l. 14s. 6,1/2d. *Iron*-wares manufactured, not otherwise rated, or not prohibited by law, pay per hundred weight on importation, 12s. 4,1/2d. and draw back on exportation

11s. $5\frac{1}{2}$d. *Iron*-ore the ton, pays on importation 2s. $4\frac{72}{100}$d. and draws back on exportation, 2s. $1\frac{87}{100}$d. Old bushels, broken, and cast iron, pays on importation, the ton, 11s. $13\frac{62}{100}$d. and draws back on exportation, 10s. $9\frac{37}{100}$d. Backs for chimnies, small, the piece, pay on importation, 2s. $4\frac{52}{100}$d. and draw back on exportation 2s. $2\frac{62}{100}$d. Backs for chimnies, large, the piece, pay on importation, 4s. $9\frac{4}{100}$d. and draw back on exportation, 4s. $5\frac{8}{100}$d. Bands for kettles, the hundred wt. pay on importation, 12s. $4\frac{5}{100}$d. and draw back on exportation, 11s. $5\frac{78}{100}$d. Fire *irons*, the groce, pay on importation, 1s. $11\frac{5}{100}$d. and draw back on exportation, 1s. $8\frac{5}{100}$d. More for every hundred weight on importation, 4s. $8\frac{1}{100}$d. and draw back on exportation, 4s. $8\frac{2}{100}$d. Hoops the hundred wt pay on importation, 9s. $9\frac{1}{100}$d. and draw back on exportation, 9s. $2\frac{1}{100}$d. Stoves, the piece, pay on importation, 19s. 3d. and draw back on exportation, 16s. $10\frac{3}{100}$d. More for every hundred weight on importation, 4s. $8\frac{1}{100}$d. and draw back the same. *Iron* kettles, the piece, pay 1s. 2 $\frac{61}{100}$d and draw back, on exportation, the same; and besides for every hundred weight on importation, 7s. $8\frac{1}{100}$d. and draw back on exportation, 6s. 9d.

Pig, or bar-*iron*, from the British plantations in America, is imported free; but all such *iron* must be stamped with a mark, denoting the colony, or place where it was made, and a certificate produced of the oath of the exporter, signed by two of the principal officers of such colony; and the master, or commanding officer of the ship, or vessel, importing such *iron*, must make oath, that the *iron* so imported, is the same with that mentioned in the certificate. 23 Geo. II. c. 29.

IRON, in *Medicine*, is said to have greater virtues than any of the other metals, which is not to be wondered at, as being the only one that is in a manner soluble in the human body. All the other metals, whether hard or soft, poisonous or salutary, may even fluid mercury itself, swallowed in their crude state, pass out of the body again unaltered; but this is not the case with *iron*, its crude filings are often taken as a medicine, and are always so much acted upon by their juices, as to produce considerable effects. It is so easily wrought upon out of the body also by fire, and by different menstruums, that it becomes an aperient or astringent, as it is differently treated; and is, under proper management, greatly superior to all other medicines in chronic cases.

Its virtues internally were not unknown to the ancients: Dioscorides attributes both an astringency and aperiency to it, and prescribes it in hæmorrhages. He also recommends its rust, or *crocus martis*, in suppressions of the menses; though he on the other hand prescribes wine or water, in which red-hot *iron* had been quenched, as an astringent in dysenteries, diarrhœas, and weaknesses of the stomach.

The great medicinal virtue of *iron* is caused by its tonic and strengthening qualities. It produces a slight and gentle irritation of the fibres, the effect of which is to constringe the sensible organic parts upon which it acts, and to increase their force and elasticity. *Iron* particularly acts upon the fibres, and the vessels of the stomach and intestines; hence it produces excellent effects in all diseases which proceed from laxity and inactivity of the digestive organs. Such are crudities, bad digestion, accompanied with diarrhœa, flatulencies, flatulent colics, &c. &c. in diseases which proceed from the former, as many hysterical, hypochondriacal, melancholic affections, intermittent fevers, tertians and quartans, &c. In those cases *iron* quickens the circulation and raises the pulse; renders the blood more florid, and as it were expands and rarefies the juices, promoting, when they are deficient, and restraining, when immoderate, the secretions that are made from the blood, as perspiration, urine, and the uterine purgations. By the same corroborating power, which renders it serviceable in promoting deficient, and restraining redundant discharges, where the suppression or flux arises from debility and relaxation, it increases on the contrary, fluxes, and confirms obstructions, when they proceed from tension, rigidity, or spasmodic strictures of the vessels. Where either the circulation is quick, or the habit plethoric, by increasing the velocity of the blood, and the plethoric symptoms, it produces heaviness, dulness, vague heats and flushings, or kindles more dangerous fevers or inflammations, or bursts some of the over-distended small vessels. In some constitutions, where *iron* is proper and salutary, particularly in hysterical and hypochondriacal cases, and where the stomach is very weak, it is apt at first to occasion great sickness and perturbation: to remedy these inconveniences, Sydenham advises to begin with very small doses, and to administer it for a while at bed-time, in conjunction with a slight opiate. In other circumstances, it is commonly taken in the morning and afternoon, and moderate exercise used to promote its action. In all cases the dose should be small and repeated; a grain, or half a grain of the metal dissolved or in a soluble state, is generally a sufficient dose. Its effects are known by nidorous eructations, and by the alvine fæces being tinged of a black colour.

Stahl, and several other modern chemists and physicians acknowledge only the tonic and strengthening qualities of *iron*. The cases in which *iron* has produced a resolving and aperient effect are these, in which the obstructions, and the defect of secretions and excretions, have proceeded from weakness and relaxation of the fibres and of the vessels rather than from a crassitude of humours, as in the chlorosis, in some kinds of jaundice, and other diseases of the same sort. The preparations of *iron* in most frequent use at present are, 1. the crude filings reduced to an impalpable powder: this is an excellent form for administering *iron* in female disorders, in which the body is weak, languid, and full of acidities: the dose of the filings is from two or three grains to a scruple or more. 2. *Mars saccharatus*, which is the filings candied with sugar, by dissolving two parts of fine sugar in water, and boiling it down to a candy consistence, and adding by little and little, one part of the cleanded filings in a kettle over a gentle fire; the vessel being continually shaken, that the filings may be crusted over with the sugar. In order to prevent the mixture from running into lumps, a little starch is previously mixed with the sugar, in the proportion of a dram to a pound. 3. *Limatura Martis præparata*, or *chalybis rubigo præparata*, is formed by moistening the filings with vinegar or water, and exposing them to a moist air, or occasionally moistening them afresh, which soon change in great part into rust; this rust may be separated from the uncorroded part, by grinding and washing over the finer powder with water. This is given in the same dose as the crude filings. 4. *Mars sulphuratus*, prepared by mixing *iron* filings with twice their weight of flower of brimstone, and as much water as will make them into a paste, which in a few hours swell up, and is then pulverized, and put into a heated crucible to deflagrate, and kept constantly stirring with an *iron* spatula, till it falls into a deep black powder; this powder urged longer in the fire, becomes red, and is called, 5. CROCUS *Martis aperiens et astringens*. 6. The salt or vitriol of *iron*, called SAL *Martis*. 7. *Tinctura Martis cum spiritu salis*. 8. FLORES *Martiales*, or flowers of *iron*. These are commonly given in the form of a bolus, from three or four grains to twenty. A tincture made by digesting four ounces of the flowers in a pint of proof-spirit, is a sufficiently elegant chalybeate, and may be given in doses of a tea-spoonful. 9. LIXIVIUM *Martis*: 10. *Extractum Martis*, is formed by inspissating solutions of *iron* in wine, or other vegetable acids, to the consistence of an extract. 11. *Mars solubilis*, or *chalybs tartarizatus*, is obtained by grinding the filings of *iron*, with an equal weight of crystals of tartar, forming the mixture into a mass with water, then pulverizing, and repeating the humectation and exsiccation alternately, till the whole falls into an impalpable powder. This elegant and useful chalybeat is given either in a solid or liquid form, from two or three grains to ten or more. It has been usually distinguished in the shops by the name of its inventor, Dr. Willis. 12. *Mars solubilis alkalinatus*, is prepared by calcining a mixture of *iron* filings and tartar in a crucible for some time with a red heat, and again calcining such part as cannot easily be reduced into fine powder. But alkaline solutions of *iron* are ill adapted for medicinal use, and are at present wholly neglected. Lewis Mat. Med. See CHALYBEAT, and *Mineral* and *Chalybeat* WATERS.

IRON, *for the bluing of*, see BLUING.

IRON, *for the expansion of*, by *heat*, see HEAT and PYROMETER.

IRON *Chambers*. See CHAMBERS.

IRON, *for the refining of*. See REFINING.

IRON, *for the conversion of, into steel*. See STEEL.

IRON *Furnace*. See FURNACE and IRON *supra*.

IRON, *Harping*. See HARPING.

IRON-*moulds*, and spots of ink in linen, may be taken out by dipping the stained part in water, sprinkling it with a little of the powdered essential salt of wood-sorrel, then rubbing on a pewter plate, and washing the spot out with warm water.

IRON-*moulds*, yellow lumps of earth or stone, found in chalk-pits, about the Chilterns, in Oxfordshire, and elsewhere; being in reality a kind of pyrites, or indigested *iron* ore.

IRON-*ore*. It has been supposed that no *iron* is found in its metallic state; though a malleable native *iron* is mentioned by Wallerius, Linnæus, and Cartheuser: and it is now known that native *iron* exists in many places; the most remarkable mass of this sort is that discovered in Siberia; which weighs 1600 pounds. It is of that species called *red-short iron*, being malleable while cold, but brittle when hot, Kirwan El. Min. p. 270. Most of the minerals called *iron*-ores, have an earthy, rusty, yellowish or brownish appearance, which proceeds from the facility with which the true *iron*-ores are decomposed. All earths and stones which are naturally yellow or red, and all those which acquire these colours by calcination, receive them from the ferruginous earth mixed with them. The yellow and red ochres consist almost solely of this earth; the black and heavy sands are also generally ferruginous. One of the richest *iron*-ores is a heavy stone, the surface of which, when newly broken, is red and bluish, and is exceedingly hard. A quintal of this ore, according to Cramer, affords from sixty to eighty pounds of the best *iron* by a single fusion. The *iron*-ore most commonly found, is a stone of the colour of rust, of an intermediate weight between those of ores in general, and unmetallic stones. Blood-stone, or hæmatites, sanguine or red-chalk, and emery, are *iron*-ores: most of these substances require little calcination before they become capable of attraction by a magnet and solution in aqua fortis; but the *iron* obtained from them is of a bad quality. *Iron*-ores are of various forms: sometimes they are earths, sometimes stones, sometimes grains.

Most ores require to be roasted previously to their fusion: some more slightly, and others with a more violent and long-continued fire; of the latter kind, are those which contain much sulphur, arsenic, or vitriolic acid; such as the black *iron*-ore, from which the Swedish *iron* is said to be obtained: of the former kind, are the ores called *bog*-ores, and others which, being in a calcined state, and containing little sulphureous matter, would, by a farther calcination, be rendered less capable of being reduced to a metallic state. Ores differ from one another with regard to the facility of their fusion: the fusible ores are those which contain sulphur, arsenic, or are mixed with some fusible earth: the *ores* fusible with difficulty, are those which contain no mixture of other substance; such are most of the ores which contain *iron* in a state nearly metallic, and those which are mixed with some very refractory substance.

In the *iron* works in Staffordshire, after the ore is dug, before it be fit for the furnace, they burn or calcine it on the open ground with small charcoal, wood, or sea-coal, to make it break into small pieces, which will be done in three days. This they call annealing or fitting it for the furnace. See IRON *supra*.

Iron may be procured from its ore in a close vessel in the following manner: roast for a few minutes in a test, placed under a muffle in a pretty strong fire, two centners of *iron*-ore, grossly powdered, that the volatile particles may be in part dissipated, and the ore softened in case it be too hard. When it has grown cold, beat it to a very fine powder, and roast it a second time in a stronger fire till it emits no smell, then take it out of the fire.

Compose a flux of three parts of the common white flux, and one part of powdered glass, and add of sandiver and coal-dust of each one half part. Add to this flux three times the quantity of the roasted ore, and mix the whole very well together; then take a good crucible well luted within, and put into it the ore mixed with the flux; cover it with common salt, and shut it close with a tile, and with lute applied to the joints. Put the common wind-furnace upon its bottom part, having a bed made of coal-dust; introduce into the furnace a small grate supported on its *iron* bars, and a stove upon it whereon the crucible may stand; furround the whole with hard coals, not very large, and light them at top. Make the fire very strong, and continue to add fresh fuel, that the vessel may never be naked at top. When the fire has thus been continued in its full strength for an hour, take out the vessel, and strike on the floor where it stands, to collect all the particles of *iron* into a body; and when cold, break the vessel, and you will find the pure *iron*.

The fuel used in most parts of Europe for the smelting of ores of *iron* is charcoal, which produces an *iron* capable of being rendered malleable by forging, better than any other. However, lately in several works in England and Scotland, *iron*-ore has been smelted by means of pit-coal, previously reduced to cinders or COAKE, by a kind of calcination similar to the operation of converting wood into CHARCOAL, by which the aqueous and sulphureous parts of the coal are expelled, while only the more fixed bituminous parts are left behind. In France uncalcined pit-coal has been tried, but without success. The use of *peat*, mixed with charcoal, and likewise by itself, has been introduced in some parts of England. Mr. Mason informs us, that at Colebrook Dale, in Shropshire, Mr. Ford makes *iron* brittle or tough as he pleases, from *iron*-ore and coal, both got in the same dale: there being cannon thus cast, so soft as to bear turning like wrought *iron*. Phil. Trans. N° 482. sect. 6.

IRON-SICK, is applied to a ship or boat, when her bolts, nails, or spikes, are so eaten with rust, that they make hollows in the planks, whereby the ship leaks.

IRON-*wood*, *sideroxylon*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the empalement of the flower is permanent, and is cut into five segments; the flower is bell-shaped, divided into five parts at the brim; it has five awl-shaped stamina, the length of the petal, terminated by single summits; and a round germen, supporting an awl-shaped style, crowned by a single stigma: the germen afterwards becomes a roundish berry, having one cell, containing four seeds. There are two species, natives of the Cape of Good Hope. Linnæus enumerates eight.

The wood of these trees being very close and solid, has given occasion for this name being applied to them, it being so heavy as to sink in water: and the title of *ironwood* having been applied to the wood, by the inhabitants of the countries where it grows, has occasioned the botanists to constitute a genus by this name. But as the characters of the plants have not been so well examined as could be wished, occasioned by their seldom flowering in Europe, it is very probable, that the plants which have been ranged under this genus, do not properly belong to it. *Miller*.

IRON-*wort*, *sideritis*, *Cunila*, in *Botany*, a genus of the *didynamia gymnospermia* class. Its characters are these: the flower has an oblong tubulous empalement, cut into five segments at the top; it is of the lip kind, of one petal, almost equal: the tube is cylindrical, the chaps oblong and taper; the upper lip is erect, and cut into two acute segments; the under lip is cut into three; the two side segments are acute, the middle round and crenated; it has four stamina within the tube, two of which are as long as the tube; the other shorter; and a four-pointed germen, supporting a slender style, a little longer than the stamina, crowned by two stigmas, the upper is cylindrical, concave and torn; the lower, short and membranaceous; the germen turns to four seeds, which ripen in the empalement. There are eleven species in the Linnæan system.

The common *iron-wort* grows in Germany, Italy, and France; and flowers in June: the herb is used; it is said to be good for wounds and ruptures; and to be so drying, as to cure a *fluor albus*.

IRON-*work*, in a *Ship*, denotes all the pieces of *iron*, of whatsoever figure or size, which are used in its construction: as bolts, boom-irons, which are composed of two rings nearly resembling the figure of 8, nails, spikes, chains and chain-plates, block-strops, cranks, braces, pintles, and goodgings.

IRONY, derived from *eironeia*, *dissimulation*, in *Oratory*, a figure in speech, whereby we plainly intend something very different from what our words express; as when we seem to praise a person at a time when we evidently rally, and discommend him.

Quintilian calls this figure *diversiloquium*, *dissimulation*, and *illusion*; and observes that it may be known by the manner of the pronunciation, or from the nature of the person, or the thing. The subjects of *irony* are vices and follies of all kinds: and it has thus been used by the most grave authors on proper occasions. Socrates used it so much as to acquire the name of *eiron*, or the *droll*. It was also used by the prophet Elijah, 1 Kings, xviii. 27. by Solomon, Eccles. xi. 9. and by our Saviour himself, Mark vii. 9.

IRRADIATION, signifies an emanation, or shooting out of rays, or subtile effluvia, from any body. See EMANATION, RAY, EFFLUVIA, and QUALITY.

IRRATIONAL *Numbers*, the same as *surd numbers*. See SURD and NUMBERS.

IRRATIONAL *Quantities*. See RATIONAL *Quantities*.

IRRATIONAL *Soul*. See SOUL.

IRREDUCIBLE *case*, in *Algebra*, is used for that case of cubic equations where the root, according to Cardan's rule, appears under an impossible or imaginary form, and yet is real. Thus is the equation, $x^3 - 90x - 100 = 0$, the root, according to Cardan's rule will be $x = \sqrt[3]{50 + \sqrt{-24500}} + \sqrt[3]{50 - \sqrt{-24500}}$, which is an impossible expression, and yet one root is equal to 10; and the other two roots of the equation are also real. Algebraists, for two centuries, have in vain endeavoured to resolve this case, and bring it under a real form; and the question is not less famous among them than the squaring of the circle is among geometers.

It is to be observed, that as in some other cases of cubic equations, the value of the root, though rational, is found

found under an irrational or furd form; becauſe the root in this caſe is compounded of two equal furds with contrary ſigns, which deſtroy each other; as if $x=5+\sqrt{5+5}-\sqrt{5}$; then $x=10$. In like manner, in the *irreducible* caſe, when the root is rational, there are two equal imaginary quantities, with contrary ſigns, joined to real quantities; ſo that the imaginary quantities deſtroy each other. Thus the expreſſion $\sqrt[3]{50+\sqrt{-24500}}=5+\sqrt{-5}$; and $\sqrt[3]{50-\sqrt{-24500}}=5-\sqrt{-5}$. But $5+5-\sqrt{-5}-\sqrt{-5}=10=x$, the root of the propoſed equation.

Dr. Wallis ſeems to have intended to ſhew, that there is no caſe of cubic equations *irreducible*, or *impracticable*, as he calls it, notwithſtanding the common opinion to the contrary. Algebra, chap. 48. p. 179, 180. edit. 1685.

Thus in the equation $x^3-63x=162$, where the value of the root, according to Cardan's rule, is $x=\sqrt[3]{81+\sqrt{-2700}}+\sqrt[3]{81-\sqrt{-2700}}$; the doctor ſays, that the cubic root of $81+\sqrt{-2700}$, may be extracted by another impoſſible binomial, viz. by $3+\sqrt{-3}$; and in the ſame manner, that the cubic root of $81-\sqrt{-2700}$ may be extracted, and is equal to $3-\sqrt{-3}$; from whence he infers, that $3+\sqrt{-3}+3-\sqrt{-3}=9$, is one of the roots of the equation propoſed. And this is true. But thoſe who will conſult his Algebra, p. 190, 191, will find that the rule he gives is nothing but a trial, both in determining that part of the root which is without a radical ſign, and that part which is within; and if the original equation had been ſuch as to have its roots irrational, his trial would never have ſucceeded. Beſides, it is certain, that the extracting the cube root of $81+\sqrt{-2700}$, is of the ſame degree of difficulty, as the extracting the root of the original equation $x^3-63x=162$; and that both require the triſection of an angle for a perfect ſolution. See M. de Moivre in the Appendix to Sanderſon's Algebra, p. 744, &c.

For Cardan's rule, ſee *Cubic* Equations.

Mr. Maſkelyn, comptroller of the exchequer, has lately deduced, by a long train of algebraical reaſonings, from Sir Iſaac Newton's celebrated binomial theorem, an infinite ſeries, which will reſolve this caſe, without any mention of either impoſſible, or negative quantities. In a ſcholium, he compares his own ſolution with thoſe of Dr. Wallis and Mr. De Moivre. Phil. Tranſ. vol. lxviii. part i. art. 42.

IRREGULAR, ſomething that deviates from the common forms or rules.

Thus we ſay, an *irregular* fortification, an *irregular* building, &c. See Building, Fortification, Battion, and Place.

Irregular *Figure*, in *Geometry*, is that whoſe ſides and angles are not equal. See Regular.

Irregulars, in *Grammar*, are ſuch inflexions of words as vary from the general rule, or pattern.

Irregular, among the *Caſuiſts*, is applied to a perſon who is unqualified for entering into orders, as being a baſtard, maimed, &c. or to an eccleſiaſtic, who is interdicted, ſuſpended, or cenſured, and by that means rendered incapable of holding a benefice, or diſcharging any of the ſacred functions.

Irregular *bodies*, are ſolids not terminated by equal and ſimilar ſurfaces.

Irregular, in the *Art of Building*, is applied not only to the parts of an edifice which deviate from the proportions eſtabliſhed by antique monuments, and confirmed by architects: as when a Doric column is made nine modules high, or a Corinthian eleven; but alſo to the places and figures of buildings, where the angles and ſides are made unequal, as in moſt of the ancient caſtles; where, without any neceſſity or confinement from the ſituation, they effected ſuch irregularity.

A column is alſo ſaid to be *irregular*, not only when it deviates from the proportions of any of the five orders, but when its ornaments, whether in the ſhaft, or the capital, are abſurd and ill choſen.

Irregular *Leaf*, in *Aſtrology*. See Leaf.

Irregularities *in the Moon's Motion*. See Moon.

Irrepleviable *Returnum*. See Returnum.

Irreplevisable, or **Irreplevisable**, in *Common Law*, ſignifies what may not be replevied, or ſet at large upon ſureties.

Irrigation, *Irrigatio*, denotes the watering a meadow or garden.

Irritability, in *Anatomy* and *Medicine*, a term firſt invented by Gliſſon, and adopted by Dr. Haller to denote an eſſential property of all animal bodies; and which he ſays, exiſts independently of and in contradiſtinction to *ſenſibility*. This ingenious author calls that part of the human body *irritable*, which becomes ſhorter upon being touched; *very irritable*, if it contracts upon a ſlight touch; and the contrary, if by a violent touch it contracts but little. He calls that a ſenſible part of the human body, which upon being touched tranſmits the impreſſion of it to the ſoul; and in brutes, he calls thoſe parts ſenſible, the irritation of which occaſions evident ſigns of pain and diſquiet in the animal. On the contrary, he calls that inſenſible, which being burnt, torn, pricked, or cut till it is quite deſtroyed, occaſions no ſign of pain nor convulſion, nor any fort of change in the ſituation of the body. From the reſult of many cruel experiments he concludes, that the epidermis is inſenſible; that the ſkin is ſenſible in a greater degree than any other part of the body; that the fat and cellular membrane are inſenſible; and the muſcular fleſh ſenſible, the ſenſibility of which he attributes rather to the nerves than to the fleſh itſelf. The tendons, he ſays, having no nerves diſtributed to them, are inſenſible. The ligaments and capſules of the articulations are alſo concluded to be inſenſible; whence Dr. Haller infers, that the ſharp pains of the gout are not ſeated in the capſules of the joint, but in the ſkin, and in the nerves which creep upon its external ſurface. The bones are all inſenſible, ſays Dr. Haller, except the teeth; and likewiſe the marrow. Under his experiments the perioſteum and pericranium, the dura and pia mater appeared inſenſible; and he infers, that the ſenſibility of the nerves is owing to the medulla, and not to the membranes. The arteries and veins are held ſuſceptible of little or no ſenſation, except the carotid, the lingual, temporal, phrygal, labial, thyroidal, and the aorta near the heart, the ſenſibility of which he aſcribed to the nerves that accompany them. Senſibility is allowed to the internal membranes of the ſtomach, inteſtines, bladder, ureters, vagina, and womb, on account of their being of the ſame nature with the ſkin: the heart is alſo aſſerted to be ſenſible: but the lungs, liver, ſpleen, and kidneys are poſſeſſed of a very imperfect, if any ſenſation. The glands, having few nerves, are endowed with only an obſcure irritation. Some ſenſibility is allowed to the tunica choroidea and the iris, though in a leſs degree than the retina; but none to the cornea. Dr. Haller concludes, in general, that the nerves alone are ſenſible of themſelves, and that in proportion to the number of nerves apparently diſtributed to particular parts, ſuch parts poſſeſs a greater or leſs degree of ſenſibility.

Irritability, according to Dr. Haller, is ſo different from ſenſibility, that the moſt irritable parts are not at all ſenſible, and *vice verſa*. He alledges facts to prove this poſition, and alſo to demonſtrate, that *irritability* does not depend upon the nerves, which are not irritable, but upon the original formation of the parts which are ſuſceptible of it. *Irritability*, he ſays, is not proportioned to ſenſibility; in proof of which, he obſerves, that the inteſtines, though rather leſs ſenſible than the ſtomach, are more irritable: and that the heart is very irritable, though it has but a ſmall degree of ſenſation.

Irritability, according to Dr. Haller, is the diſtinguiſhing characteriſtic between the muſcular and cellular fibres; whence he determines the ligaments, perioſteum, meninges of the brain, and all the membranes compoſed of the cellular ſubſtance, to be void of *irritability*. The tendons are unirritable; and though he does not abſolutely deny *irritability* to the arteries, yet his experiments on the aorta produced no contraction. The veins and excretory ducts are, in a ſmall degree, irritable: and the gall-bladder, the ductus choledochus, the ureters and urethra are only affected by a very acrid corroſive; but the ſeminal veſſels are conſiderably irritable. The glands and mucous ſinuſes, the uterus in quadrupeds, the human matrix and the genitals are all irritable; as are alſo the muſcles, particularly the diaphragm. The œſophagus, ſtomach, and inteſtines, are irritable: but of all the animal organs the heart is endued with the greateſt *irritability*. In general, there is nothing irritable in the animal body but the muſcular fibres; and the vital parts are the moſt irritable. This power of motion, ariſing from irritations, is ſuppoſed to be different from all other properties of bodies, and probably reſides in the glutinous mucus of the muſcular fibres, altogether independently of the influence of the ſoul. The *irritability* of the muſcles is ſaid to be deſtroyed by drying of the fibres, congealing of the fat, and more eſpecially by the uſe of opium in living animals. The phyſiological ſyſtem, of which an abſtract has been now given, has been adopted and confirmed by Caſtel and Zimmermann; and alſo by Dr. Brocklefby, who ſuggeſts, that *irritability*, as diſtinguiſhed from ſenſibility, may depend upon a ſeries of nerves different from ſuch as ſerve either for voluntary motion or ſenſation. Haller's Diſſ. on the ſenſible and irritable Part of Animals, tranſlated by Tiſſot. paſſim. Phil. Tranſ. vol. xlix. art. 38. p. 240. This ſyſtem has been controverted by Mr. Le Cat, and particularly by Dr. Whytt in his Phyſiological Eſſays. Eſſ. ii.

ISABELLA, in *Conchyliology*, the name given by the French naturalists to the beautiful pale-brown volute, so much esteemed in the Dutch cabinets.

ISAGON, in *Geometry*, is sometimes used for a figure consisting of equal angles.

ISAIAH, or *the Prophecy of* ISAIAH, a canonical book of the Old Testament. *Isaiah* is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah, king of Judah. The five first chapters of his prophecy relate to the reign of Uzziah; the vision in the sixth chapter happened in the time of Jotham: the next chapters, to the fifteenth, include his prophecies under the reign of Ahaz; and those that were made under the reigns of Hezekiah and Manasseh, are related in the next chapters to the end. *Isaiah* foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred years before it came to pass. But the most remarkable of his predictions are those concerning the Messiah, which describe not only his descent but all the remarkable circumstances of his life and death. The style of this prophet is noble, nervous, sublime, and florid, which he acquired by converse with men of the greatest abilities and elocution: Grotius calls him the Demosthenes of the Hebrews. However the profoundness of his thoughts, the sublimity of his expressions, and the extent of his prophecy, render him one of the most difficult of all the prophets; and the commentaries that have been hitherto written on his prophecy fall short of a full explication of it. Bishop Lowth's new translation, &c. published in 1778, threws considerable light on the composition and meaning of *Isaiah*.

ISASMELUCUS, in *Natural History*, the name of a genus of fossils of the class of the *selenites*, but of the columnar, not the rhomboidal kind. See *Tab. of Fossils, Class* 2.

The selenites of this genus consist of six sides, and two obtuse or abrupt ends; and all their sides being very nearly of the same breadth, they much resemble broken pieces of the columns of spelg-crystal.

The bodies of this genus, as well as the rest of the columnar selenites, are subject to a longitudinal crack, which sometimes admitting a small quantity of clay, shapes it into the figure of an ear of grass. Hill's Hist. of Foss. p. 121. See the article SELENITES.

ISARUS, in *Zoology*, a name given by the ancients to the CHAMOIS goat.

ISATIS, in *Botany*. See WOAD.

ISATUS, in *Zoology*. See LAGOPUS.

ISATODES, a word used by Hippocrates, and some other of the old writers, to express a greenish colour of the bile discovered in the stools, which resemble the colour of the herb *isatis*, or woad. This was esteemed an indication of a highly depraved bile.

ISCLEMOS, in *Botany*, a name used by many authors for the grass called *gramen manna*, manna grass, or Russia-seed.

ISCHURION was also a word used by the ancients to expres any thing given as a remedy in hæmorrhages, or other fluxes of blood, whether from wounds or otherwise.

ISCHÆMUM, in *Botany*, the name by which Linnæus calls the *jobanneth*, or camel's hay. This makes a peculiar genus of plants of the *polygamia monœcia* class: the characters of which are these: it has male and hermaphrodite flowers, distinct from one another; the male flower is very small, and always stands upon the glume of the cup of the female flower; its cup is a bivalve glume, with no awns, and containing only one flower; the flower is another bivalve glume of the size of the cup, and without awns; the stamina are three short capillary filaments, and the antheræ simple; the hermaphrodite flower is larger; its cup is a large bivalve glume, placed within the common glume, and terminated by a twisted awn, or beard between each valve; the flower is a small double glume; the pistil consists of an oblong germen, and two reflex styli; all the glumes of the cup, flower, &c. continue to surround and include the seed; and they never drop it out till forced from them, each containing one seed.

ISCHAS, in *Botany*, a name given by Clusius, and some others, to those species of fishmal or seaweed, which have tuberous or knobby roots, and are called by others *agrii*.

ISCHENIA, Ισχηνια, in *Antiquity*, anniversary sports celebrated at Olympia, in memory of Ischenius, the grandson of Mercury and Hecrea; who, in a time of famine, devoted himself to be a sacrifice for his country, and was honoured with a monument near the Olympian stadium.

ISCHIADIC, Ισχιαδικὸς, derived from ισχιον, or ισχιον, *coxa*, the *hip*, an epithet given by physicians to two veins of the foot, which terminate in the crural.

The first, called the *great ischiadic*, is formed by ten little branches, proceeding from the toes, which, uniting together, pass by the muscles of the calf of the leg.

The lesser *ischiadic* is formed by several ramifications, proceeding from the skin and muscles, which encompass the articulation of the thigh.——They are also called *sciatic veins*.

ISCHIAS, ISCHIADICA or ISCHIATICA. See SCIATICA.

ISCHIO-CAVERNEUX, in *Anatomy*, a name given by Winslow, and other of the French anatomists, to a muscle of the penis, called also by some the *posterior* and *accessorius penis*, but now generally named, from its office, the erector.

ISCHIO-CAVERNEUX is also applied by the same authors to a muscle of the female pudenda, called by some the *sphincter vaginæ*, and *cavernosus muliebris*, and by Cowper and Albinus, from its office, the erector *clitoridis*.

ISCHIUM, or ISCHION, derived from ισχυς, *robur*, *strength*, in *Anatomy*, the name of one of the bones of the hip; called also *coxa* and *coxendix*.

In the *ischium* is a deep cavity, called *cotyle* or *acetabulum*, which receives the head of the thigh bone. This cavity is encompassed with a cartilaginous circle, which serves to strengthen the thigh.

The *ischium* is one of the ossa innominata of authors.—See *Tab. Anat. (Osteol.) fig.* 3. *lit. S. n.* 19. *fig.* 12. *lit. c.* This is the lowest portion of the *os innominatum*, as also of the whole trunk. It is divided into the body, the tuberosity, and the ramus or branch.

The body of the *os ischium* forms the lowest and greatest part of the acetabulum, and sends out an apophysis backward, called the *spine* of the ischium. The tuberosity is very thick, unequal, and turned downwards; and it is on this part that the whole body rests when we sit. It appears cartilaginous, because of the dried and hardened remains of the tendons. The whole convex portion of it is originally an apophysis, of which the marks are obliterated sooner in some subjects than in others: three muscular impressions may be distinguished in it.

The branch of the *ischium* is a kind of thin flat production, or apophysis, which ascends forward from the tuberosity of the curvature of the *os pubis*, and it is often covered in part by a continuation of the epiphyses of the tuberosity.

These three parts of the *ischium* taken together, form a large opening, which makes the greatest part of the foramen ovale. Three other notches are remarkable in this bone; one posterior, between the tuberosity and the spine, for the passage of the internal obturator muscle, which is a little cartilaginous, and divided into three or four superficial channels; one lateral, between the tuberosity and the acetabulum, for the passage of the external obturator muscle; and one anterior, at the edge of the acetabulum for ligaments. Winslow.

ISCHNAMBLUCIS, in *Natural History*, the name of a genus of fossils of the class of the SELENITES, but one of those which are of a columnar form, not of the common rhomboidal one. See *Tab. of Fossils, Class* 2.

The word is derived from the Greek, ισχνος, *thin*, αμβλυς, *blunt* or *obtuse*, and κιων, a *column*; and expresses a body in form of a thin or flatted column, with obtuse ends. The bodies of this genus are of an octohedral figure, consisting of six long planes and about two broader ends. The top and base planes are broader than the rest. The crack which runs through the whole length of bodies of this genus is often filled with clay, which spreads itself into the form of an ear of some grasses: of this genus there are only four known species. Hill.

ISCHNOPHONIA, formed of ισχνος, *thin*, and φωνη, *voice*, a word used by some authors to express that weakness and thriftness of the voice which attends persons in some diseases; more usually, however, it is understood to express a stammering or imperfection in the speech.

ISCHURIA, ισχουρια, formed from ισχω, *I stop*, and ουρον, *urine*, in *Physic*, a disease consisting in an entire suppression of urine.

It is occasioned by any thing which may obstruct the passages of the reins, ureters, or the neck of the bladder, as sand, stone, mucus, &c.—It may also arise from an obstruction of the nerves, which pass to the reins or bladder, as we see it does, in a palsy of the parts below the diaphragm.—The too great distention of the bladder may also produce the same effect; for the fibres being much lengthened, and consequently condensed, the spirits necessary for their contraction cannot get admittance; whence it is that persons, who have retained their urine a long time, find a great deal of difficulty in discharging it. See SUPPRESSION *of urine*.

ISCUSTOS, a word used by the writers of the middle ages as the name of a gem, but seeming to be only a corrupt way of spelling asbestos. Albertus says it was of a yellowish colour, and found in Spain, and that its fibrous texture made it capable of being wrought into cloth, which when thrown into the fire, was not consumed, but only cleaned by burning. See ASBESTOS.

ISELASTICS, *Iselastica*, kind of games, or combats, celebrated in the cities of Greece and Asia, in the time of the Roman emperors.

The victors at these games had very considerable privileges conferred on them; after the example of Augustus, and the Athenians, who did the like to the conquerors at the Olympic, Pythian, and Isthmian games. They were crowned on the spot, immediately after their victory: had pensions allowed them; were furnished with provisions at the public cost; were carried home in triumph, and made to enter their cities through a breach in the walls; whence their appellation, from ισελαυνειν, *to enter*.

ISIA, Ισια, feasts and sacrifices anciently solemnized in honour of the goddess Isis.

The *Isia* were full of the most abominable impurities; and for that reason, those who were initiated into them were obliged to take an oath of secrecy. They held for nine days successively, but grew so scandalous, that the senate abolished them at Rome, under the consulate of Piso and Gabinius. They were reestablished by Augustus, and the emperor Commodus himself assisted at them, appearing among the priests of that goddess with his head shaven, and carrying the Anubis.

ISIAC TABLE is one of the most considerable monuments of antiquity, discovered at Rome in 1525, and supposed by the various figures in bas-relief upon it, to represent the feasts of Isis, and other Egyptian deities. There have been various opinions as to the antiquity of this monument: some have supposed that it was engraved long before the time when the Egyptians worshipped the figures of men and women. Others, among whom is bishop Warburton, apprehend, that it was made at Rome, by persons attached to the worship of Isis. Dr. Warburton considers it as one of the most modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

ISIACI, priests of the goddess Isis.—Dioscorides tells us, that they bore a branch of sea-wormwood in their hands instead of olive. They sung the praises of the goddess twice a day, viz. at the rising of the sun, when they opened her temple; after which they begged alms the rest of the day, and returning at night, repeated their orisons, and shut up the temple.

Such was the life and office of the *Isiaci*; they never covered their feet with any thing but the thin bark of the plant papyrus, which occasioned Prudentius and others to say they went bare-footed. They wore no garments but linen, because Isis was the first who taught mankind the culture of this commodity. See Diodorus Siculus, and Plutarch's Isis and Osiris.

ISINGLASS, a name given to Muscovy talc, and to ICHTHYOCOLLA; which see.

A strong glue is made of *isinglass dissolved* in spirit of wine. See GLUE and ICHTHYOCOLLA.

ISINGLASS-*fish*, the English name of the fish from which the drug called *ichthyocolla* or *isinglass* is made. It is a species of the *acipenser* or sturgeon, and is distinguished by not having any of the tubercles which the body of the common sturgeon has. See ACCIPENSER and HUSO.

ISIR, or IXIR, a name used by some of the chemical writers for an elixir.

ISIS, in *Mythology*, a goddess of the ancient Egyptians, worshipped by them and many other nations: *Isis* is reported by Diodorus Siculus to have invented many excellent medicines: and hence, says he, after she was received among the number of the deities, she was applied to for the cure of distempers; and frequently indicated remedies by dreams. Galen takes notice of some plasters which bear her name.

ISIS, in *Natural History*, a term used by Linnæus to express a genus of ZOOPHYTES, comprehending six different species.

ISKA, a name given by the ancients to a light kind of agaric, growing to the old stumps of the oak, hazel, and other trees. This being a very light kind of fuel, was used by the ancients in the manner of a cautery, as we have learned from the Indians to use moxa or the down of mugwort leaves.

ISLAM. See MAHOMETANS.

ISLAND, or ISLE, a tract of dry land encompassed with water; either with the sea, a river or lake. In which sense *island* stands contradistinguished from *continent*, or terra firma.

Some conclude, that *islands* are as ancient as the world, and, it is by no means probable, that the large *islands*, far remote from the continent, are new, or that they either arose out of the sea, or were torn from the main land. Nor is it less certain, that there have been new *islands* formed by the casting up of vast heaps of clay, mud, sand, &c. as that, for instance, of Tongming, in the province of Nanquin in China; or by the violence of the sea, which has torn off large promontories from the continent, as the ancients imagined Sicily, and even Great Britain to have been formed. It is also certain, that some have emerged above the waves, as Santorini formerly, and three other *isles* near it lately; the last in 1707, which rose from the bottom of the sea, after an earthquake, that was supposed to have loosened it from its bed.

Several naturalists are of opinion, that islands were formed at the deluge; others think they have been rent and separated from the continent by violent storms, inundations, and earthquakes. These last have observed that the East-Indies, which abound in *islands* more than any other part of the world, are likewise more annoyed with earthquakes, tempests, lightnings, volcanos, &c. than any other part.

Varenius thinks most of these opinions true in some instances, and believes that there have been *islands* produced each of these ways. St. Helena, Ascension, and other steep rocky *islands*, he supposes to have become so, by the sea's overflowing their neighbouring champaigns. By the heaping up huge quantities of sand, and other terrestrial matters, he thinks the *islands* of Zealand, Japan, &c. were formed: Sumatra and Ceylon, and most of the East-Indian *islands*, he rather thinks were rent off from the main land; and concludes, that the *islands* of the Archipelago were formed in the same way; imagining it probable, that Deucalion's flood might contribute towards it.

The ancients had a notion, that Delos, and some few other *islands* rose from the bottom of the sea; which, how fabulous soever it might appear, agrees very well with some later observations. Seneca takes notice, that the *island* Thera had risen out of the Ægean sea in his time, of which the mariners were eye-witnesses.

Floating-ISLANDS. Histories are full of accounts of *floating-islands*; but the greater part of them are either false, or founded on exaggerations. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of water in lakes, and with the roots of plants, forming congeries of different sizes, which not being fixed to the shore in any part, are blown about by the winds, and float on the surface. These are generally found in lakes, where they are confined from being carried too far; and from being broken by the agitation of the water. And in process of time some of them acquire a very considerable size. Seneca tells us of many of these *floating-islands* in Italy; and some later writers have described not a few of them in other places. But however true the histories of these might have been at the time when they were wrote, there remain very few proofs of their truth at this time, these *islands* having either disappeared again, or been fixed to the sides, in some part, in such a manner as to have made a part of the shore. Pliny tells us of a great *island* which at one time floats about in the lake Cutilia, in the country of Reatinum, which was discovered to the old Romans by an oracle: and Pomponius tells us, that in Lydia there were several *islands* so loose in their foundations, that every little accident shook and removed them. Herodotus speaks also very largely of the lake Chemnis in Ægypt. See ALTERATIONS *of the Earth*.

Gryphiander has written a Latin treatise expressly on *islands*, *de Insulis*.

ISLANDS, *Fortunate*. See FORTUNATE.

ISLAND, *Crystal*. See CRYSTAL.

ISLAND-*fish*, in the *Fish-trade*, a name given to the common COD-FISH when it has been caught and preserved in *Iceland*.

ISLEBIANUS *lapis*, in *Natural History*, a name given by authors to a kind of blackish slate, very heavy, not very hard, and easily splitting into thin flakes. It is dug near *Isleb* in Thuringia, whence it has its name, and is much of the nature of that sort of black slate which we have common in England, lying over the coal strata.

As our slate of this kind contains usually leaves of fern and other plants, this foreign kind contains the impressions of several kinds of fish, so exactly delineated in shape, and with the fins, scales, and all other parts so perfect, that the species are easily known. All these impressions and delineations are, however, so flat and thin, and have taken up so little room in the stone, that they seem rather to have been the skins and exuviæ of fish than the whole bodies of them; but this is not wonderful when we consider how easily the bodies, and even the bones of fishes, may be dissolved; and that these exuviæ are lodged in a substance which contains a vitriolic salt, very capable of effecting such a solution. It is easy to conceive, that this and other such salts, while in a state of solution in water, before the concretion of the matter of this stone into a hard mass, might make that water a menstruum capable of thus dissolving the

ISABELLA, in *Conchyliology*, the name given by the French naturalists to the beautiful pale-brown volute, so much esteemed in the Dutch cabinets.

ISAGON, in *Geometry*, is sometimes used for a figure consisting of equal angles.

ISAIAH, *or the Prophecy of* ISAIAH, a canonical book of the Old Testament. *Isaiah* is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Amaziah, king of Judah. The five first chapters of his prophecy relate to the reign of Uzziah; the vision in the sixth chapter happened in the time of Jotham: the next chapters, to the fifteenth, include his prophecies under the reigns of Ahaz; and those that were made under the reigns of Hezekiah and Manasseh, are related in the next chapters to the end. *Isaiah* foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred years before it came to pass. But the most remarkable of his predictions are those concerning the Messiah, which describe not only his descent but all the remarkable circumstances of his life and death. The style of this prophet is noble, nervous, sublime, and fluid, which he acquired by converse with men of the greatest abilities and elocution: Grotius calls him the Demosthenes of the Hebrews. However the profoundness of his thoughts, the sublimeness of his expressions, and the extent of his prophecy, render him one of the most difficult of all the prophets; and the commentaries that have been hitherto written on his prophecy fall short of a full explication of it. Bishop Lowth's new translation, &c. published in 1778, throws considerable light on the composition and meaning of *Isaiah*.

ISAMBLUCIS, in *Natural History*, the name of a genus of fossils of the class of the *silenites*, but of the columnar, not the rhomboidal kind. See *Tab. of Fossils, Class* 2.

The *selenites* of this genus consist of six sides, and two obtuse or abrupt ends; and all their sides being very nearly of the same breadth, they much resemble broken pieces of the columns of spiry crystal.

The bodies of this genus, as well as the rest of the columnar selenites, are subject to a longitudinal crack, which sometimes admitting a small quantity of clay, shapes it into the figure of an ear of grass. Hill's Hist. of Foss. p. 221. See the article SELENITES.

ISARUS, in *Zoology*, a name given by the ancients to the CHAMOIS goat.

ISATIS, in *Botany*. See WOAD.

ISAYIS, in *Zoology*. See LAGOPUS.

ISATODES, a word used by Hippocrates, and some other of the old writers, to express a greenish colour of the bile discovered in the stools, which resemble the colour of the herb *isatis*, or woad. This was esteemed an indication of a highly depraved bile.

ISCHÆMON, in *Botany*, a name used by many authors for the grass called *gramen manna*, manna grass, or Ruffaloes.

ISCHÆMON was also a word used by the ancients to express any thing given as a remedy in hæmorrhages, or other flowers of blood, whether from wounds or otherwise.

ISCHÆMUM, in *Botany*, the name by which Linnæus calls the *fibernarich*, or camel's hay. This makes a peculiar genus of plants of the *polygamia monœcia* class: the characters of which are these: it has male and hermaphrodite flowers, distinct from one another; the male flower is very small, and always stands upon the glume of the cup of the female flower; its cup is a bivalve glume, with no awns, and containing only one flower; the flower is another bivalve glume of the size of the cup, and without awns; the stamina are three short capillary filaments, and the antheræ simple; the hermaphrodite flower is larger; its cup is a large bivalve glume, placed within the common glume, and terminated by a twisted awn, or beard between each valve; the flower is a small double glume; the pistil consists of an oblong germen, and two reflex styli; all the glumes of the cup, flower, &c. continue to turn round and include the seed; and they never drop it out till forced from them, each containing one seed.

ISCHAS, in *Botany*, a name given by Clusius, and some others, to those species of tithymal or SPURGE, which have tuberous or knobby roots, and are called by others *apios*.

ISCHENIA, ἰσχηνία, in *Antiquity*, anniversary sports celebrated at Olympia, in memory of Ischenus, the grandson of Mercury and Hecuva, who, in a time of famine, devoted himself to be a sacrifice for his country, and was honoured with a monument near the Olympian stadium.

ISCHIADIC, ἰσχιαδικὸς, derived from ἰσχίον, or ἰσχίς, *coxa*, the *hip*, an epithet given by physicians to two veins of the foot, which terminate in the crural.

The first, called the *great ischiadic*, is formed by ten little branches, proceeding from the toes, which, uniting together, pass by the muscles of the calf of the leg.

The lesser *ischiadic* is formed by several ramifications, proceeding from the skin and muscles, which encompass the articulation of the thigh.——They are also called *sciatic veins*.

ISCHIAS, ISCHIADICA or ISCHIATICA. See SCIATICA.

ISCHIO-CAVERNEUX, in *Anatomy*, a name given by Winslow and other of the French anatomists, to a muscle of the penis, called also by some the *posterior* and *accessorius penis*, but now generally named, from its office, the erector.

ISCHIO-CAVERNEUX is also applied by the same authors to a muscle of the female pudenda, called by some the *pubio-ischi clitoridis*, and *accessorius manifestus*, and by Cowper and Albinus, from its office, the erector *clitoridis*.

ISCHIUM, or ISCHION, derived from ἰσχυς, *robur*, *strength*, in *Anatomy*, the name of one of the bones of the hip; called also *os* and *exundix*.

In the *ischium* is a deep cavity, called *cotyle* or *acetabulum*, which receives the head of the thigh bone. This cavity is encompassed with a cartilaginous circle, which serves to strengthen the thigh.

The *ischium* is one of the ossa innominata of authors.—*See Tab. Anat. (Osteol.) fig.* 3. *lit. S. n.* 19. *fig.* 12. *lit. c.*

This is the lowest portion of the *os innominatum*, as also of the whole trunk. It is divided into the body, the tuberosity, and the ramus or branch.

The body of the *os ischium* forms the lowest and greatest part of the acetabulum, and sends out an apophysis backward, called the spine of the ischium. The tuberosity is very thick, unequal, and turned downward; and it is on this part that the whole body rests when we sit. It appears cartilaginous, because of the sleek and hardened remains of the tendons. The whole convex portion of it is originally an apophysis, of which the marks are obliterated sooner in some subjects than in others: three muscular impressions may be distinguished in it.

The branch of the *ischium* is a kind of thin flat production, or apophysis, which ascends forward from the tuberosity of the curvature of the os pubis, and it is often covered in part by a continuation of the epiphyses of the tuberosity.

These three parts of the *ischium* taken together, form a large opening, which makes the greatest part of the foramen ovale. Three other notches are remarkable in this bone; one posterior, between the tuberosity and the spine, for the passage of the internal obturator muscle, which is a little cartilaginous, and divided into three or four superficial channels; one lateral, between the tuberosity and the acetabulum, for the passage of the external obturator muscle; and one anterior, at the edge of the acetabulum for ligaments. Winslow.

ISCHNAMBLUCIS, in *Natural History*, the name of a genus of fossils of the class of the SELENITES, but one of those which are of a columnar form, not of the common rhomboidal one. See *Tab. of Fossils, Class* 2.

The word is derived from the Greek, ἰσχνὸς, *thin*, ἀμβλὺς, *blunt* or *obtuse*, and κίων, a *column*; and expresses a body in form of a thin or blunted column, with obtuse ends. The bodies of this genus are of an octohedron figure, consisting of six long planes and about two broken ends. The top and base planes are broader than the rest. The crack which runs through the whole length of bodies of this genus is often filled with clay, which spreads itself into the form of an ear of some grasses: of this genus there are only four known species. Hill.

ISCHNOPHONIA, formed of ἰσχνὸς, *thin*, and φωνὴ, *voice*, a word used by some authors to express that weakness and faintness of the voice which attends persons in some diseases; more usually, however, it is understood to express a stammering or imperfection in the speech.

ISCHURIA, ἰσχουρία, formed from ἰσχὼ, *I stop*, and οὐρὸν, *urine*, in *Physic*, a disease consisting in an entire suppression of urine.

It is occasioned by any thing which may obstruct the passages of the veins, ureters, or the neck of the bladder, as sand, stone, mucus, &c.—It may also arise from an obstruction of the nerves, which pass to the reins or bladder, as we see it does, in a palsy of the parts below the diaphragm.—The too great distention of the bladder may also produce the same effect; for the fibres being much lengthened, and consequently condensed, the spirits necessary for their contraction cannot get admittance; whence it is that persons, who have retained their urine a long time, find a great deal of difficulty in discharging it. See SUPPRESSION *of urine*.

ISCUSTOS, a word used by the writers of the middle ages as the name of a gem, but seeming to be only a corrupt way of spelling albestos. Albertus says it was of a yellowish colour, and found in Spain, and that its fibrous texture made it capable of being wrought into cloth, which when thrown into the fire, was not consumed, but only cleaned by burning. See ALBESTOS.

ISELASTICS, *Iselastica*, kind of games, or combats, celebrated in the cities of Greece and Asia, in the time of the Roman emperors.

The victors at these games had very considerable privileges conferred on them; after the example of Augustus and the Athenians, who did the like to the conquerors at the Olympic, Pythian, and Isthmian games. They were crowned on the spot, immediately after their victory; had pensions allowed them; were furnished with provisions at the public cost; were carried home in triumph, and made to enter their cities through a breach in the walls; whence their appellation, from *εισελαυνειν*, to enter.

ISIA, Isia, feasts and sacrifices anciently solemnized in honour of the goddess Isis.

The *Isia* were full of the most abominable impurities; and for that reason, those who were initiated into them were obliged to take an oath of secrecy. They held for nine days successively, but grew so scandalous, that the senate abolished them at Rome, under the consulate of Piso and Gabinius. They were re-established by Augustus, and the emperor Commodus himself assisted at them, appearing among the priests of that goddess with his head shaven, and carrying the Anubis.

ISIAC TABLE is one of the most considerable monuments of antiquity, discovered at Rome in 1525, and supposed by the various figures in bas relief upon it, to represent the festis of Isis, and other Egyptian deities. There have been various opinions as to the antiquity of this monument: some have supposed that it was engraved long before the time when the Egyptians worshipped the figures of men and women. Others, among whom is bishop Warburton, apprehend, that it was made at Rome, by persons attached to the worship of Isis. Dr. Warburton considers it as one of the most modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

ISIACI, priests of the goddess Isis.—Diofcorides tells us, that they bore a branch of fea-wormwood in their hands inftead of olive. They fung the praifes of the goddefs twice a day, viz. at the rifing of the fun, when they opened her temple; after which they begged alms the reft of the day, and returning at night, repeated their orifons, and fhut up the temple.

Such was the life and office of the *Ifiaci*; they never covered their feet with any thing but the thin bark of the plant papyrus, which occafioned Prudentius and others to fay they went bare-footed. They wore no garments but linen, becaufe Ifis was the firft who taught mankind the culture of this commodity. See Diodorus Siculus, and Plutarch's Ifis and Ofiris.

ISINGLASS, a name given to Mufcovy talc, and to ICHTHYOCOLLA; which fee.

A ftrong glue is made of *ifinglafs* diffolved in fpirit of wine. See GLUE and ICHTHYOCOLLA.

ISINGLASS-*fifh*, the Engliſh name of the fifh from which the drug called *ichthyocolla* or *ifinglafs* is made. It is a fpecies of the *acipenfer* or ſturgeon, and is diſtinguiſhed by not having any of the tubercles which the body of the common ſturgeon has. See ACIPENSER and HUSO.

ISIR, or IXIR, a name uſed by ſome of the chemical writers for an elixir.

ISIS, in *Mythology*, a goddeſs of the ancient Egyptians, worſhipped by them and many other nations. *Iſis* is reported by Diodorus Siculus to have invented many excellent medicines: and hence, ſays he, after ſhe was received among the number of the deities, ſhe was applied to for the cure of diſtempers; and frequently indicated remedies by dreams. Galen takes notice of ſome plaiſters which bear her name.

ISIS, in *Natural Hiſtory*, a term uſed by Linnæus to expreſs a genus of ZOOPHYTES, comprehending ſix different ſpecies.

ISKA, a name given by the ancients to a light kind of agaric, growing to the old ſtumps of the oak, hazel, and other trees. This being a very light kind of fuel, was uſed by the ancients in the manner of a cautery, as we have learned from the Indians to uſe moxa or the down of mugwort leaves.

ISLAM. See MAHOMETANS.

ISLAND, or ISLE, a tract of *dry* land encompaſſed with water; either with the ſea, a river or lake. In which ſenſe *iſland* ſtands contradiſtinguiſhed from *continent*, or terra firma.

Some conclude, that *iſlands* are as ancient as the world, and, it is by no means probable, that the large *iſlands*, far remote from the continent, are new, or that they either aroſe out of the ſea, or were torn from the main land. Nor is it leſs certain, that there have been new *iſlands* formed by the caſting up of vaſt heaps of clay, mud, ſand, &c. as that, for inſtance, of Tiangming, in the province of Nanquin in China: or by the violence of the ſea, which has torn off large promontories from the continent, as the ancients imagined Sicily, and even Great Britain to have been formed. It is alſo certain, that ſome have emerged above the waves, as Santorini formerly, and three other *iſles* near it lately; the laſt in 1707, which roſe from the bottom of the ſea, after an earthquake, that was ſuppoſed to have looſened it from its bed.

Several naturaliſts are of opinion, that iſlands were formed at the deluge; others think they have been rent and ſeparated from the continent by violent ſtorms, inundations, and earthquakes. Theſe laſt have obſerved that the Eaſt-Indies, which abound in *iſlands* more than any other part of the world, are likewiſe more annoyed with earthquakes, tempeſts, lightnings, volcanos, &c. than any other part.

Varenius thinks moſt of theſe opinions true in ſome inſtances, and believes that there have been *iſlands* produced each of theſe ways. St. Helena, Aſcenſion, and other deep rocky *iſlands*, he ſuppoſes to have become ſo, by the ſea's overflowing their neighbouring champaigns. By the heaping up huge quantities of ſand, and other terreſtrial matters, he thinks the *iſlands* of Zealand, Japan, &c. were formed: Sumatra and Ceylon, and moſt of the Eaſt-Indian *iſlands*, he rather thinks were rent off from the main land; and concludes, that the *iſlands* of the Archipelago were formed in the ſame way; imagining it probable, that Deucalion's flood might contribute towards it.

The ancients had a notion, that Delos, and ſome few other *iſlands* roſe from the bottom of the ſea; which, how fabulous ſoever it might appear, agrees very well with ſome later obſervations. Seneca takes notice, that the *iſland* Theraſia roſe out of the Ægean ſea in his time, of which the mariners were eye-witneſſes.

Floating-ISLANDS. Hiſtories are full of accounts of *floating-iſlands*; but the greater part of them are either falſe, or founded on exaggerations. What we generally ſee of this kind is no more than the concretion of the lighter and moſt viſcous matter floating on the ſurface of water in calms, and with the roots of plants, forming congeries of different ſizes, which not being fixed to the ſhore in any part, are blown about by the winds, and float on the ſurface. Theſe are generally found in lakes, where they are confined from being carried too far; and from being broken by the agitation of the water. And in proceſs of time ſome of them acquire a very conſiderable ſize. Seneca tells us of many of theſe *floating-iſlands* in Italy; and ſome later writers have deſcribed not a few of them in other places. But however true the hiſtories of theſe might have been at the time when they were wrote, there remain very few proofs of their truth at this time, theſe *iſlands* having either diſappeared again, or been fixed to the ſides, in ſome part, in ſuch a manner as to have made a part of the ſhore. Pliny tells us of a great *iſland* which at one time ſwam about in the lake Cutilia, in the country of Reatinum, which was diſcovered to the old Romans by an oracle: and Pomponius tells us, that in Lydia there were ſeveral *iſlands* ſo looſe in their foundations, that every little accident ſhook and removed them. Herodotus ſpeaks alſo very largely of the lake Chemnis in Egypt. See ANOMALITIES *of the Earth*.

Gryphiander has written a Latin treatiſe expreſly on *iſlands*, *de Inſulis*.

ISLAND, *Fortunate*. See FORTUNATE.

ISLAND, *Cryſtal*. See CRYSTAL.

ISLAND-*fiſh*, in the *Fiſh-trade*, a name given to the common COD-FISH when it has been caught and preſerved in *Iceland*.

ISLEBIANUS *lapis*, in *Natural Hiſtory*, a name given by authors to a kind of blackiſh ſtone, very heavy, not very hard, and eaſily ſplitting into thin flakes. It is dug near *Iſleb* in Thuringia, whence it has its name, and is much of the nature of that ſort of black ſlate which we have common in England, lying over the coal ſtrata.

As our ſlate of this kind contains uſually leaves of fern and other plants, this foreign kind contains the impreſſions of ſeveral kinds of fiſh, ſo exactly delineated in ſhape, and with the fins, ſcales, and all other parts ſo perfect, that the ſpecies are eaſily known. All theſe impreſſions and delineations are, however, ſo flat and thin, and have taken up ſo little room in the ſtone, that they ſeem rather to have been the ſkins and exuviæ of fiſh than the whole bodies of them; but this is not wonderful when we conſider how eaſily the bodies, and even the bones of fiſhes, may be diſſolved; and that theſe exuviæ are lodged in a ſubſtance which contains a vitriolic ſalt, very capable of effecting ſuch a ſolution. It is eaſy to conceive, that this and other ſuch ſalts, while in a ſtate of ſolution in water, before the concretion of the matter of this ſtone into a hard maſs, might make that water a menſtruum capable of thus diſſolving

the

the bodies and bones of fishes, while the outer skin and scales being much tougher, and of a very different nature, might escape the effects of them. It is well known that the fins and scales, and other external parts of fish, are much more capable of bearing maceration in water than the internal substances of them; and it is easy to conceive that these, after having withstood that power in the water, would at length subside down among the muddy matter that was in form some of the strata of this slate: the motion of the water would not fail to expand these skins, though ever so thin, into the true and exact shape of the whole fish; and when mud should upon the surface of the new formed stratum, the next quantity of the same matter that subsided would form another stratum, which falling evenly upon the former, would cover it, and on the following concretion of both, the figure of the fish would be beautifully preserved between two plates or flakes of a fissile stone.

It is very remarkable, that as in these slates of fish preserving fishes, two external parts only are preserved, the bones and flesh being washed off, on the other hand, in those fossile fishes brought from Syria, the skins and scales are wanting, and the skeletons are principally the part preserved. In some of these the bones are not extant, small parcels of the flesh being found petrified among them; but this flesh is stripped of the skin. The stone in which these Syrian fishes are preserved is also very different from the fish slate, being whitish or greyish, and very hard. The bones of this kind found on mount Libanus, where they are very common, have very fine delineations of the star-fish complete. Woodw. Cat. Foss. vol. ii. p. 23, &c.

ISLEBIANS, in *Ecclesiastical History*, a name given to those who adopted the sentiments of a Lutheran divine of Saxony, called John Agricola, a disciple and companion of Luther, a native of *Isle*, whence the name; who, misapprehending some of the precepts of St. Paul with regard to the Jewish law, declaimed against the law and the necessity of good works. See ANTINOMIANS.

ISLES, in *Architecture*, the sides or wings of a building.

ISNARDIA, in the *Linnæan System of Botany*, the name of a genus of plants, of the *tetrandria monogynia* class; the distinguishing characters of which are these: the cup is a perianthium, formed like a bell, slightly divided at the extremity into four pointed segments; it has no petals; the stamina are four filaments, growing out of the middle of the cup; the antheræ are simple; the germen of the pistil is inclosed in the substance of the cup; the style is simple, and longer than the stamina; and the stigma is thick and large; the fruit is made out of the base of the cup, which is square, and has four cells; the seeds are few in number, and of an oblong figure.

ISOCHRONAL, or ISOCHRONOUS, is applied to such VIBRATIONS of a PENDULUM, as are performed in equal times.

Of which kind are all the vibrations or swings of the same pendulum, whether the arcs it describes be longer or shorter; for when it describes a shorter arc, it moves so much the slower; and when a long one, proportionably faster.

ISOCHRONAL *Line*, is that wherein a heavy body is supposed to descend without any acceleration.

Leibnitz, in the Act. Erud. Lipf. for April, 1689, has a discourse on the *linea isochrona*, in which he shews, that a heavy body, with a degree of velocity acquired by its descent from any height, may defcend from the same point by an infinite number of *isochronal* curves, which are all of the same species, differing from one another only in the magnitude of their parameters; such as are all the quadratocubical parabolords, and consequently similar to one another. He shews also, how to find a line, in which a heavy body descending, shall recede uniformly from a given point, or approach uniformly to it. See CYCLOID.

ISOETES, in *Botany*, a genus of the *cryptogamia* class of ferns: the characters of which are, that the small flowers form an anthera, within the base of the leaf, and the female a double-celled capsule in the same situation.

ISOMERIA, formed of ισος, *equal*, and μερος, *part*, in *Algebra*, a method of freeing an equation from fractions, by reducing all the fractions to one common denominator, and then multiplying each member of the equation by that common denominator.

This amounts to the same with what is otherwise called conversion of *equations*.

ISOPERIMETRICAL *Figures*, are such as have equal perimeters, or circumferences.

It is demonstrated in geometry, that among *isoperimetrical* figures, that is always the greatest which contains the most sides or angles.—From whence it follows, that the circle is the most capacious of all figures which have the same circumference with it.

That of two *isoperimetrical* triangles, which have the same base, and one of them two sides equal, and the other unequal; that is the greater whose sides are equal. That of *isoperimetrical* figures, whose sides are equal in number, that is the greatest which is equilateral, and equiangular.

Hence flows the solution of that popular problem, To make the hedging or walling, which will fence in one acre, or any other determinate number of acres, *a*, fence in any other greater number of acres whatever, *b*.

For, call *x* one side of a parallelogram, whose area is the number of acres *a*; then will $\frac{a}{x}$ be the other side, and $2 - \frac{a}{x}$ $+ 2x$, will be the perimeter of the parallelogram; which must be equal to four times the square root of *b*, that is, $2 - \frac{a}{x} + 2x = 4\sqrt{b}$, whence the value of *x* will easily be had by the solution of a quadratic equation: and infinite numbers of squares and parallelograms may be made, which shall have the same perimeter, yet different areas. E. gr. if one side of a square be 10, and one side of a parallelogram be 15, and the other 1, such square and parallelogram will be *isoperimetrical*, viz. each 40: yet the area of the square will be 100, and of the parallelogram only 15.

Isoperimetrical lines and figures have greatly engaged the attention of mathematicians since the invention of fluxions. The analysis of the general problem concerning figures, that, among all, those of the same perimeter produce maxima and minima, was given by Mr. James Bernoulli, from computations that involve second and third fluxions. And several inquiries of this nature have been since profecuted in like manner, but not always with equal success. Mr. Mac Laurin, to vindicate the doctrine of fluxions from the imputation of uncertainty, or obscurity, has illustrated this subject, which is commonly confidered as one of the most abstruse parts of this doctrine, by giving the resolution and composition of these problems by first fluxions only; and in a manner that suggests a synthetic demonstration, ferving to verify the solution. Analysis magni Problematis *Isoperimetrici*, Act. Erudit. Lipf. 1701. p. 213, feq. See Mac Laurin's Fluxions, book I. chap. 13. p. 480, feq. See also Mem. Acad. Science, 1706, 1718, and Jo. Bernoulli Oper. tom. i. p. 202, 208, 424, feq. tom. ii. p. 235, feq.

ISOCSEPHUS, Ισοκεφος, in *Antiquity*, an appellation given to judges, who had equal jurisdiction and authority; it was likewise applied to a cafe where the votes were equal on both sides. Another fenfe is given to it, viz. when the letters of different words made up the same sum, they were faid to be ισοκεφοι προς αλλα; for the Greeks had no other cyphers to number with, but the letters of their alphabet; fo that a fignified one, β two, γ three, &c. But befide words, the ancients had likewife whole verfes of this kind; and it is pretended that there are feveral fuch verfes in Homer. Hift. Acad. Inscript. vol. iii. p. 211, feq.

ISOPYRUM, in *Botany*, a genus of the *polyandria polygynia* claſs. Its characters are these: the flower has no empalement; but has five oval petals, and five short tubulous nectaria, situated within the petals; it has a great number of short hairy stamina, and several oval germina, which afterwards become so many recurved capsules, with one cell, filled with small seeds. There are three species.

ISORA, in *Botany*, the name given by Plumier to a genus of plants, called by Linnæus, HELICTERES.

ISOSCELES *triangle*, of ισος, *equal*, and σκελος, *leg*, is a triangle which has two equal sides. In an *isosceles* triangle, FDE (*Tab.* III. *Geometry, fig.* 57.) the angles γ and α, oppofite to the equal sides, are equal; and a line drawn from the top or vertex, F, cutting the base into two equal parts, is perpendicular to the base. The same line also bisects the vertical angle of the triangle. It appears likewise, that if the equal sides be produced, the angles under the base will be equal, the sum of those above and below respectively being equal to two right angles. And if the vertical angles of two *isosceles* triangles be equal, the two triangles will be equi-angular. Moreover, every equilateral triangle must be equiangular.

ISPIDA. See KING-*fisher*.

ISSONG, in *Botany*, a name given by the people of Guinea to a species of plant, which they infuse in water, and afterwards boil, and then wash the head with it, as a cure for all kinds of the head-ach. It is a plant described by the botanical writers under the name of *pisum vesicarium fructu nigro, alba macula notato*, the bladder-pea, with a black fruit marked with a white spot: and called by the people of Malabar, where it also grows very plentifully, *wangu*. It is also found in Barbadoes and Jamaica, and is there called *parsley*. Philof. Transf. N° 232.

ISSUANT, ISSUING, in *Heraldry*, is understood of a lion, or other animal, in a coat of arms, that seems just coming

quently fall off. There iſſues from the ſcabs white ſanious matter, and the whole texture of the ſkin is altered; the cuticle being beſet with ſmall ſcales, and feeling rough like the ſkin of an elephant, whence the diſeaſe has been called by ſome *elephantiaſis*.

In other reſpects, this complaint is attended with no ſenſation of pain, or uneaſineſs; but the face is inflated, the teeth become black, the breath becomes fœtid, and tumors of the bubo kind appear on ſeveral parts of the body, all which become finally malignant ulcers; and in the progreſs of the diſeaſe, large ſcabs, with portions of the ſkin, fall from different parts of the face.

Perſons ſubject to the itch. Theſe are principally men of a ſanguineous temperament of body and phlegmatic diſpoſition, who moſt eaſily fall into the moiſt *itch* of the ſimple and benign kind, and are of all others moſt difficultly cured of it. Thoſe, on the other hand, who are moſt ſubject to the ſimple dry *itch*, are men of a dry temperament and choleric habit. All perſons who eat coarſe foods, with much ſalt, and drink ſour and decayed liquors, eaſily fall into this kind; as alſo ſuch as live in a damp ſoggy air, and thoſe who are ſubject to obſtructions of the liver, and who have long been afflicted with quartans. Thoſe who have a ſuppreſſion or diminution of the uſual quantity of urine, and by that means have the ſalt ſeroſities of the blood not duly carried off, are alſo more ſubject than others; as alſo, from the ſame cauſe, are ſuch as have had old ulcers ſuddenly ſtopped, or iſſues dried up; people who have been uſed to cupping, at certain regular times, and afterwards neglect it; and finally, thoſe of an idle and ſedentary courſe of life.

Cauſes of it. The cauſes of the ſimple benign *itch* are a ſtaſis and corruption of the lymphatic humours, and this is often occaſioned by the humid temperament of the air, which in cold ſeaſons prevents the going off of thoſe humours by ſweat, which had been directed to the ſkin by nature for that purpoſe, hence they remain there and corrupt; and there are other things which more or leſs concur to cauſing it; theſe are a change of the food and drink continued for ſome time, and with this a plethoric habit of body. It is ſometimes the criſis of other diſeaſes, as of a quartan, &c. Theſe are the cauſes, and theſe the perſons ſubject to the *itch*, as a primary diſeaſe beginning with them; but its uſual method of propagating itſelf is by contagion; fifty people, at leaſt, having it by this means, for one, on whom it appears of itſelf. A free uſe of ſalted food greatly exaſperates the *itch* in all perſons, but this alone can have but little effect towards the original producing it. The malignant or complicated *itch* owes its origin to other cauſes. The ſcrine *itch* is always cauſed by the ſcurvy, and the venereal or pocky *itch* owes its origin to the corruption of the lymph in the venereal diſeaſe.

Dr. Bonomo has given another account of the cauſe of this diſtemper, which is adopted by Dr. Mead: he carefully examined ſeveral globules of the matter picked out of the puſtules of itchy perſons with a microſcope, and found them to be minute living creatures, in ſhape reſembling a tortoiſe, of briſk motion, with ſix feet, a ſharp head, and two little horns at the end of the ſnout.—Hence he makes no ſcruple to impute this contagious diſeaſe to the continual biting of theſe animalcules in the ſkin; by means of which ſome portion of the ſerum oozing out through the ſmall apertures of the cutis, little watery bladders are made, within which the inſect continuing to gnaw, the inſected are forced to ſcratch, and by ſcratching increaſe the miſchief; breaking not only the little puſtules, but the ſkin too, and ſome little blood-veſſels, and ſo making ſcabs, cruſty ſores, &c. But it has been ſuppoſed by others to be more probable, that the ſmall inſects or ACARI, which are often found in the puſtules of the *itch*, make choice of theſe as a proper nidus, and do not originally occaſion them. See ANIMALCULES.

Hence we perceive how the *itch* comes to be catching; ſince theſe creatures, by ſimple contact, may very eaſily paſs from one body to another; their motion being wonderfully ſwift, and they crawling on the ſurface of the body, as well as under the cuticula.

Hence alſo we learn the reaſon of the cure of this diſeaſe by lixivial waſhes, baths, and ointments made of ſalts, ſulphurs, mercury, &c. theſe being very powerful in killing the vermin lodged in the cavities of the ſkin, which ſcratching will never do, they being too minute to be caught under the nails. And if in practice it is found, that this diſeaſe, after it ſeemed to be cured by unction, frequently returns again, this is eaſily accounted for; ſince, though the ointment may have killed all the living creatures, yet it may not, poſſibly, have deſtroyed all their eggs laid, as it were, in the neſts of the ſkin; from which they afterwards breed again, and renew the diſtemper.

ITCH, *prognoſtics in the.* The ſimple benign *itch*, of the moiſt kind, is the mildeſt of all the kinds, and in general the moſt eaſily cured; but as it is more ſubject to ulcerations than the other kinds, this ſometimes makes the cure in bad habits of body more difficult. The dry *itch* is more troubleſome, and takes more time in the cure than the moiſt, and is more troubleſome to the patient; but in the moiſt, ſanious, and ſuppurating *itch*, when it is raſhly treated by mercurial and ſulphureous ointment, by quickſilver girdles, by aſtringents and refrigerants, and is driven in, which is a very common caſe, there always ariſe very unhappy ſymptoms, ſuch as anxieties of the præcordia, aſthmas, ſuffocative catarrhs, intermittent fevers, and ſometimes inflammatory acute ones, both which are of a different appearance from thoſe diſtempers in their uſual ſtate; not unfrequently alſo terrible chronic complaints are brought on by this, as cachexies, anaſarcas and œdemas. The *itch*, in general, when newly caught by infection, is always much more eaſily cured than when it ariſes from a fault in the humours, and is conſequently much more deeply rooted; for the ſame reaſon, the chronic *itch* is of all others the moſt difficult to be cured; and where there concurs with it a defect or fault of ſome of the viſcera, as is too often the caſe, the cure is yet greatly the more difficult. The malignant *itch* is always much more deeply rooted in the patient, and of conſequence is much more difficult of cure than the ſimple; and in particular, the ſcrine or ſcorbutic *itch* is one of the moſt ſtubborn diſeaſes we know of. In this caſe the food, and other circumſtances, often make the cure much more difficult than it naturally would be: poor people are often infected with this; and their diet not being in their choice, are with difficulty cured of it. The venereal *itch*, though generally accounted the moſt terrible of all the kinds, is yet much more eaſily cured than the ſcorbutic, and ſometimes than the ſimple chronic kind, when treated in a proper manner.

Method of cure. The corrupt ſtate of the humours is to be corrected according to the ſeveral kinds. In the benign *itch*, this is effected by alexipharmics and diuretics, ſuch are decoctions of the woods of guaiacum, ſaſſafras, and the like, with elecampane and pimpernel roots, and the common abſorbents fated with acids, as the crabs-eyes, or oyſter-ſhells, ſaturated with lemon juice, or the like; and the acrimony of the humours is greatly taken off by ſulphur and nitre given in powders, or by the ſimple balſam of ſulphur in oil of almonds. After this, external applications complete the cure; of this kind are the mercurial ointments, and thoſe which contain ſulphur. But mercurial unguents cannot be depended upon for this effect, unleſs in ſlight caſes; as their antipſoric efficacy ſeems to reach no farther than thoſe parts of the ſkin to which they are applied, and as they cannot with ſafety be applied freely, to any great extent of the body, particularly of the trunk. In the dry *itch* fomentations and baths do much more than ointments; and of this kind are decoctions of the oxylapathum root, and a lixivium of quick lime and ſulphur, or the general bathing in mineral ſprings.

In the malignant itch, the ſcrine or ſcorbutic is to be treated as the ſcurvy, to which it owes its origin. The anti-ſcorbutic juices ſhould be taken for ſome time, and the decoction of tobacco made very ſtrong, is a good external application; mercurial ointments have alſo their uſe here, and the violent heat of the eruptions may be mitigated by camphor, and by the frogs ſpawn plaiſter.

In the venereal itch, the method to be uſed for a cure is the ſame with that for the venereal diſeaſe in any other appearance, but in this there muſt be always kept up a gentle perſpiration: mercurial ointments have peculiarly a place here: and when the diſeaſe is ſo rooted as to give way to no other means, recourſe is to be had to a ſalivation: and finally, the cure is to be completed by evacuating the corrected humours by ſtool, in which caſe calomel is a very uſeful ingredient in purges, and the decoctions of the diaphoretic and diuretic vegetables are of great ſervice in completing it, and preventing a return. Junker Conſp. Med. p. 452, &c.

The beſt medicine yet known for the *itch* is ſulphur, which ſhould be uſed both externally and internally. The parts moſt affected may be rubbed with an ointment made of the flowers of ſulphur two ounces, crude ſal ammoniac finely powdered, two drams; hogs lard, or butter, four ounces; to which may be added a ſcruple, or half a dram of the eſſence of lemon, in order to take away the diſagreeable ſmell. About the quantity of a nutmeg of this may be rubbed upon the extremities, at bed time, twice or thrice a week. Before the patient begins to uſe the ointment; if he be of a full habit, he ought to be bled, or take a purge or two. During the uſe of it, he ſhould alſo take, night and morning, as much of the flower of brimſtone and cream of tartar, in a little treacle or new milk, as will keep the body gently open; and take care of catching cold. The quantity of ointment

above

above directed will generally suffice for the cure of one person; but if any symptoms of the disease remain, the medicine may be repeated. Mercury is a dangerous, and has often proved a hurtful medicine in this disease; and should be used with great caution. Mercurial girdles have produced many lamentable effects. Those who would avoid this disease ought to beware of infected persons, to use wholesome food, and study universal cleanliness. Buchan.

ITCH *animal*, a creature said to be found in the pustules of the *itch*: it is a species of ACARUS.

ITEA, in *Botany*, a name used, by the ancients in general, to signify the willow; but, by some of the Greek writers, it is also used as a name for the pine.

ITEA, in the *Linnæan System of Botany*, is a genus of the *pentandria monogynia* class: the characters are, that the empalement of the flower is small, permanent, and erect, ending in five acute points; the flower has five petals, inserted in the empalement, and five awl-shaped stamina as long as the petals, terminated by roundish summits, and an oval germen supporting a cylindrical permanent style; the germen becomes a long oval capsule, with the style at the top, having one cell filled with small seeds. Miller.

ITHYNTERION, *thorupus*, in *Antiquity*, a staff of laurel, which prophets usually carried in their hands, otherwise called *hyperas*.

ITINERANT *judges*, or *justices*, such as were formerly sent with commissions into divers counties, to hear chiefly those causes called *pleas of the crown*: the same with what are otherwise called *justices in eyre*. See JUSTICE.

ITINERARIUM, in *Surgery*, a name given by Hildanus, and many other writers, to a staff used in the operation of cutting for the stone.

ITINERARY, the description a traveller gives of the course of his journey, and of the curiosities, &c. he observed therein.

The *Itinerary* of Antonine shews all the grand Roman roads in the empire, and all the stations of the Roman army. It was drawn up by order of the emperor Antoninus Pius; but is now very defective, having suffered much under the hand of the copists and editors.

ITINERARY *column*. See COLUMN.

ITERATION. See REITERATION.

ITING, in *Natural History*, a name given by the people of the Philippine islands to a bird common among them, and seeming, by the description, to be of the woodpecker kind. It is of the bigness of the starling.

It is a very noisy bird, but its voice is not disagreeable. People say this bird has but one strait gut.

IVA, in *Botany*, a genus of the *monoecia pentandria* class; the characters of which are, that the plants have male and female flowers; the male flowers have a common three-leaved empalement; the flowers that form the disc have one petal cut into five parts at the brim: the receptacle is distinguished by its hairs; the empalement of the female flowers is composed of five flosculous radii, which have no corolla; two long styles, and a naked obtuse seed.

IVAHAH is the name of one of the canoes or boats used by the islanders of the South-sea, for short excursions to sea: it is wall-sided and flat bottomed. These boats are of different sizes, their length being from seventy-two feet to ten; but their breadth is by no means in proportion: for those of ten feet are about a foot wide, and those of more than seventy are scarcely two. The fighting *vaahah* is the longest, with its head and stern considerably raised above the body, in a semicircular form; the stern is sometimes seventeen or eighteen feet high. When they go to sea they are fastened together side by side, at the distance of about three feet, by strong poles of wood, laid across and lashed to the gun-wales. On these, in the fore-part, a stage or platform is raised, about ten or twelve feet long, somewhat wider than the boats, and supported by pillars about six feet high: on this stage are ranged the fighting men, whose missive weapons are slings and spears; and below the stage the rowers sit. The sailing *vaahahs* are from forty feet long to ten; those of twenty-five feet and upwards occasionally carry sail. The travelling *vaahah* is always double, and furnished with a small neat house about five or six feet broad, and six or seven feet long. Hawkesworth's Voyages, vol. ii. p. 211.

IVAPACANGA, in *Botany*, a name given by some authors to the climbing plant, of which the sarsaparilla, used in medicine, is the root.

JUBILEE, among the *Jews*, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands returned to their ancient owners. The *jubilees* were not regarded after the Babylonish captivity.

The word, according to some authors, comes from the Hebrew *jobel*, which signifies *fifty*: but this must be a mistake, for the Hebrew יובל, *jobel*, does not signify fifty; neither do its letters, taken as cyphers according to their numerical power, make that number; being 10, 6, 2, and 30, that is, in all, say, that *jobel* signifies a *ram*, and that the year thus called, because proclaimed with a ram's horn in memory of the ram that appeared to Abraham in the thicket. Masius chooses to derive the word from the first inventor of musical instruments, who, for that reason, were called by his name; whence the words *jobel* and *jubilee* came to signify the year of liberty and remission, because proclaimed with the sound of those instruments which at first was made of the horn of a ram. Others derive *jobel* from יבל hiphil הֹבִיל, *hobil*, which signifies to recall, because this year restored all slaves to their liberty. The institution of this festival is in Lev. xxv. 8. &c. The learned are divided about the year of *jubilee*, some maintaining that it was every forty-ninth, and others that it was every fiftieth year. The ground of the former opinion is chiefly this, that the forty-ninth year, in course a sabbatical year, if the *jubilee* had been the fiftieth, the land must have had two fallow years, which, without a miracle, would have produced a dearth. On the other hand it is alledged, that the Scripture expressly declares for the fiftieth year, Lev. xxv. 10, 11. And besides, if the *jubilee* and sabbatical year had been the same, they would have been no need of a prohibition to sow, reap, &c. because this kind of labour was prohibited by the law of the sabbatical year. Lev. xxv. 4, 5. The authors of the Universal History, book i. chap. 7. note R, endeavour to reconcile these opinions, by observing, that as the *jubilee* began in the first month of the civil year, which is the seventh of the ecclesiastical, it might be said to be either the forty-ninth or fiftieth, according as one or other of these computations were followed. The political design of the law of the *jubilee* was to prevent the total oppressions of the poor, as well as their being in a perpetual slavery. By this means a kind of equality was preserved through all the families of Israel, and the distinction of tribes was also preserved, that they might be able, when there was occasion, on the *jubilee* year, to prove their right to the inheritance of their ancestors. Observed also, like the Olympiads of the Greeks, and Lustra of the Romans, for the readier computation of time. The *jubilee* has also been supposed to be a type of the gospel state and dispensation, described by Isa. lxi. ver. 1, 2. in reference to this period, as the "acceptable year of the Lord."

JUBILEE, in a *more modern sense*, denotes a grand solemnity, or ceremony, celebrated at Rome, to which the pope grants a plenary indulgence to all sinners, at least to as many as visit the churches of St. Peter and St. Paul at Rome.

The *jubilee* was first established by Boniface VIII. in 1300, in favour of those who should go *ad limina apostolorum*; and it was only to return every hundredth year. But the first celebration brought in such flocks of people to Rome, that the Germans call this the golden year, which occasioned Clement VI. in 1343, to reduce the period of the *jubilee* to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, the supposed age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life. Boniface IX. granted the privilege of holding *jubilees* to several princes, and monasteries: for instance, to the monks of Canterbury, who had a *jubilee* every fifty years, when people flocked from all parts to visit the tomb of Thomas a Becket. *Jubilees* are now become more frequent, and the pope grants them as often as the church, or himself, have occasion for them. There is usually one at the inauguration of a new pope.

To be intitled to the privileges of the *jubilee*, the bull injoins fastings, alms, and prayers. It gives the priests a full power to absolve, in all cases, even those otherwise reserved to the pope: to make commutations of vows, &c. in which it differs from a *plenary indulgence*. During the time of *jubilee*, all other indulgences are suspended. One of our kings, viz. Edward III. caused his birth-day to be observed in manner of a *jubilee*, when he became fifty years of age, in 1362, but never before or after. This he did, by releasing prisoners, pardoning all offences except treason, making good laws, and granting many privileges to the people.

There are particular *jubilees* in certain cities, when several of their feasts fall on the same day: at Puey en Velay, for instance, when the feast of the Annunciation happens on Good-Friday; and at Lyons, when the feast of St. John Baptist concurs with the feast of Corpus Christi.

In 1640, the Jesuits celebrated a solemn *jubilee* at Rome; that being the centenary, or hundredth year from their institution,

coming out from under a chief, fesse, a house, a wood, or the like; and only shews half his body.

It is not very easy to distinguish the lion *issuant* from the lion naissant: some say the *issuant* is that which comes out from the bottom of the chief, shewing his head, neck, the top of his fore-legs, and his tail, against the chief of the coat; whereas the naissant has its rise about the middle of the field, and shews all his fore-part, with the tip of his tail, as if he were rising out of the earth.

ISSUE, in *Common Law*, has divers applications; being sometimes taken for the children begotten between a man and his wife—sometimes, for profits growing from amercements or fines—sometimes, for profits of lands and tenements—but more frequently, for the point of matter depending in suit, whereupon the parties join, and put their cause to the trial of the jury.

In all these occasions, *issue* has but one signification, which is, an effect of a cause preceding; as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punishment of any man's offence, are the effect of his transgression; the point referred to the trial of twelve men, is the effect of pleading, or process.

Issues concerning causes are of two kinds; that upon matter of fact, and that upon matter of law. An *issue* in fact is when the plaintiff and defendant have agreed upon a point to be tried by a jury; and *issue* in law is when there is a demurrer to a declaration, plea, &c. and a joinder in demurrer, which is an *issue at* law to be determined by the judges. *Issues* in fact are either *general* or *special*.

ISSUE, *General*, seems to be that whereby it is referred to the jury to bring in their verdict, whether or no the defendant hath done any such thing as the plaintiff lays to his charge.

For example, if it be an offence against any statute, and the defendant plead Not guilty; this being put to the jury, is called the *general issue*.—So if a man complains of a private wrong, which the defendant denies, and pleads no wrong, nor disseisin, and this be referred to the jury; it is likewise the *general issue*.

ISSUE, *Special*, is that, wherein special matters being alledged by the defendant in his defence, both parties join on this point, and so go to a demurrer, if it be *quæstio juris*; or else to a trial by the jury, if it be *quæstio facti*: as in assault and battery, where the defendant pleads that the plaintiff struck first.

ISSUE, *Feigned*, in *Chancery*, is used when a matter of fact is strongly controverted and the court directs the matter to be tried by a jury: but as no jury can be summoned to attend this court, the fact is usually directed to be tried at the bar of the court of king's bench, or at the assizes upon a *feigned issue*. For, in order to bring it there and have the point in dispute and that only put in *issue*, an action is feigned to be brought, wherein the pretended plaintiff declares, that he laid a wager of 5*l.* with the defendant, that *A.* was heir at law to *B.* and then avers that he is so, and brings his action for the 5*l.* The defendant allows the wager, but avers that *A.* is not the heir to *B.*; and thereupon that *issue* is joined, which is directed out of chancery to be tried; and thus the verdict of the jurors at law determines the fact in the court of equity. These *feigned issues* seem to be borrowed from the *sponsio judicialis* of the Romans and are also frequently used in the courts of law, by consent of the parties, to determine some disputed right without the formality of pleading, and thereby to save much time and expence in the decision of a cause. Blackst. Com. book iii. p. 452.

ISSUES *on sheriffs* are for neglects and defaults, by amercement and fine to the king, levied out of the *issues* and profits of their lands; and double or treble *issues* may be laid on a sheriff for not returning writs, &c. But they must be taken off before they are estreated into the exchequer, by rule of court, on good reason shewn. *Issues* shall be levied on jurors, for non-appearance; though on reasonable excuse proved by two witnesses, the justices may discharge the *issues*.

ISSUES, in *Physic* and *Surgery*, small artificial apertures in a fleshy part of the body, to drain off superfluous moisture, or give vent to any noxious humour.

They are usually made in the arms, legs, or back, either by cauftics or incision. Caution is used to place them about the middle of a muscle, that the necessary motion of the part may not incommode them, or pain the patient. There is an easy way of making an *issue*, which succeeds best in children; it is done after this manner: having applied a small piece of blistering plaster, about the bignels of a small pea, to the part where you would have an *issue*, and letting it lie on for a few hours, it will cause a blister; the skin being raised, apply a pea, as usual; and compress it tight with a bandage, till by degrees it sinks in, and forms an *issue*.

The method by incision is performed thus: first mark the proper place with ink; then elevating the integuments between the thumb and fore-finger of the surgeon and an assistant on each side, you next proceed to make an incision through them, either with the scalpel or lancet, big enough to admit a pea, which being inserted and covered with a plaster and compress, nothing more than your roller is wanting to complete the operation. Thus by cleaning and dressing the wound every morning and evening with a fresh pea, it by degrees, in a day or two, degenerates into a little ulcer, discharging daily a quantity of purulent matter, which should be carefully cleansed or wiped off at every dressing.

There is a second method of making *issues* by wounding the skin with an actual cautery, or red hot iron, which is usually included in a sort of capsula, or case of iron, to conceal it from terrifying the patient. When the case is fixed upon the proper part for the *issue*, the red hot iron is then pressed down upon the integuments, and the eschar or burn is next to be dressed with fresh butter or basilicon, till by repeating the dressing every day, it separates, and then, the ulcer formed, it is to be filled with a pea, and dressed as before.

The third method of making *issues* is by the application of potential cauteries, or corroding medicines; in order to which a piece of plaster is first perforated, and then applied, so as its aperture may cover the place marked with ink for the *issue*: a piece of the cauftic is then put into the aperture of the plaster, and retained close down upon the skin, with some scraped lint, a small compress, and a large plaster; and lastly, with a larger compress and bandage. The patient is then to be ordered to rest for about six or eight hours, more or less, according to the strength of the cauftic, which time being elapsed, and the dressings removed, the eschar is to be treated as before directed in an actual cautery.

In whichever of these methods the *issue* is made, it must be dressed at least twice every day, especially if it runs well, and in the summer season; and at each dressing you must put in a fresh pea, and cover it with a clean plaster, or a piece of waxed paper or silk, or an ivy leaf, retained with compress and bandage. But the deligation for *issues* is much more commodiously performed with a leathern swathe, fastened by clasps, than by a circular linen roller. In this manner *issues* are to be kept open till the patient is recovered of the disorder for which they were made.

Issues are chiefly made for various disorders in the head, eyes, ears, teeth, sciatica, and other painful disorders, which are this way frequently relieved or cured. But in stubborn disorders it is frequently necessary to make two or more *issues* to produce any considerable effect, as one in each arm, or in one arm and leg of the same side. In this case proper topical remedies as cantharides, black hellebore, &c. should be speedily applied.

Issues above the shoulder-blades are good in asthmatic cases; and Dr. Mead thinks their benefit, in this and some other distempers, lies not only in giving vent to the humours, but likewise in lessening the over-great tension of the nerves. Monit. et Præcept. Medic. cap. v. The use of *issues*, or setons, made in the side on the part most affected, is recommended instead of bleeding, in consumptive cases. See CONSUMPTION.

In order to close an *issue*, little more is required than to discharge the pea, and to refrain from putting in any more, by which means alone it will close up in a short time: but if any proud flesh should arise, it may be amputated, or else removed with burnt alum. Lastly, it is observable, that when the *issues* of people far advanced in years cease to make their wonted discharge, and turn of a livid and blackish hue, it is a sign that they are invaded by some desperate disorder, and that life is very near its period.

ISTHMIA, *Isthmia*, or ISTHMIAN *Games*, *Ludi* ISTHMII, were solemn sports, being one of the four sacred games celebrated in ancient Greece.

They were called *Isthmian*, because they were celebrated in the Corinthian Isthmus, a neck of land by which Peloponnesus is joined to the continent.

Plutarch, in the life of Theseus, tells us, they were instituted by that hero to the honour of Neptune; in imitation of Hercules, who had before instituted the Olympic games to the honour of Jupiter; but Archias refers their institution to the honour of Melicertes, or Palæmon, son of Athamus king of Thebes, whom the Latins call Portumnus. Others say, they were instituted by Nisus, son of Neptune; and others, by Sisyphus, brother of Athamus, king of Corinth, about 1350 years before Christ. Others are of opinion that there were two distinct solemnities observed in the Isthmus, one in honour of Melicertes, and another in honour of Neptune.

Archias and others say, the conqueror's prize at these games was a crown of parsley.—Plutarch and Strabo

say, it was at first a crown of pine; and that this was afterwards changed for one of parsley; but that at length the pine was resumed; and to this was added a reward of one hundred silver drachmæ.

These games were held, according to Pindar, every three years, or, according to Pliny, every five; and were esteemed so sacred, that after the destruction of Corinth, by Mummius, about 146 years before the Christian æra, the Sicyonians were charged with the keeping them up. They were so celebrated, and the concourse at them was so great, that only the prime persons of the most remarkable cities could have place in them.—The Athenians had only as much room allotted them as the sail of a ship, which they sent yearly to Delos, could cover.

ISTHMUS, ἰσθμὸς, in *Geography*, a narrow neck, or slip of ground, which joins two continents; or joins a peninsula to the terra firma, and separates two seas.

The most celebrated *isthmuses* are that of Panama or Darien, which joins North and South America; that of Suez, which connects Asia and Africa; that of Corinth, or Peloponnesus, in the Morea; that of Crim-Tartary, otherwise called Taurica Chersonesus; that of the peninsula Romania and Europe, or the *isthmus* of the Thracian Chersonesus, twelve furlongs broad; being that which Xerxes undertook to cut through. The ancients had several designs of cutting the *isthmus* of Corinth, which is a rocky hillock, about ten miles over; but they were all vain, the invention of sluices being not then known.—There have been attempts, too, for cutting the *isthmus* of Suez, to make a communication between the Red-sea and the Mediterranean.

ISTHMUS is also applied by the anatomists to several parts of the human body, particularly that narrow part of the throat, situate betwixt the two tonsils.

Also to the ridge that separates the two nostrils: and to the passage in that part of the medulla oblongata of the brain, which lies between the cerebrum and cerebellum, and which reaches from the place called *anus* to the fourth ventricle. The upper part or cover of this conduit, or passage, which is betwixt the testes and the foremost vermicular process of the cerebellum, and to which two it is tied at its two ends, and to the processes which come from the cerebellum to the testes at its sides, is called *valenta major*; it is of a medullary substance, and its use is to keep the lympha from falling out above the nerves in the basis of the skull.

ITAIARA, in *Ichthyology*, a name by which some have called a Brasilian fish, of the turdus kind, of great beauty, and a very delicate taste, more usually known by the name JURUNCAPEBA.

ITALIAN, the language spoken in Italy.

This tongue is derived principally from the Latin, and of all the languages formed from the Latin, there is none which carries with it more visible marks of its original than the *Italian*.

It is accounted one of the most perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason; for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasms and hyperboles.

The language corresponds to the genius of the people; they are slow and thoughtful; and accordingly, their language runs heavily, though smoothly; and many of their words are lengthened out to a great degree.—They have a great taste for music; and, to gratify their passion this way, have altered abundance of their primitive words; leaving out consonants, taking in vowels, softening and lengthening out their terminations, for the sake of the cadence.

Hence the language is rendered extremely musical, and succeeds better than any other in operas, and some parts of poetry: but it fails in strength and nervousness: hence also a great part of its words, borrowed from the Latin, become so far disguised, that they are not easily known again.

The multitude of sovereign states into which Italy is divided, has given rise to a great number of different dialects in that language; which, however, are all good in the place where they are used.—The Tuscan is usually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the *Italian* proverb, *Lingua Toscana in bocca Romana*.

The *Italian* is generally pretty well understood throughout Europe, and is frequently spoken in Germany, Poland, and Hungary.—At Constantinople, in Greece, and in the ports of the Levant, the *Italian* is used as commonly as the language of the country; indeed in those places it is not spoken so pure as in Tuscany, but is corrupted with many of the proper words and idioms of the place; whence it takes a new name, and is called *Franc Italian*. See LANGUAGE.

ITALIAN *coins, measures, marble, silks.* See the respective.

ITALIC, or ITALIAN *Hours*, are the twenty-four of the natural day, accounted from the sun to sun the same day, to the same again the next day.

This way of reckoning was used by the Jews, and is used by the Italians to this day.

ITALIC *character*, in *Printing*. See LETTER.

ITALIC *sect*, is the name of a party of ancient philosophers, founded by Pythagoras; so called, as the philosopher taught in Italy, spreading his doctrine among the people of Tarentum, Metapontus, Heraclea, &c.

ITCH, a disease of the skin, wherein it is usual to the oozing out of certain sharp saline humours, which gather into pustules, and occasion a pruriency.

The *psora* or *itch* is described by Celsus as a hardness and roughness of the skin, from which arise pustules thereon; some drier, other moister, which let out a tenuous matter, which occasions a continual pruriency or itching.

These eruptions are most frequent about the joints of the limbs, and between the fingers: sometimes they spread over the whole body; in others they are only in some parts, and in some they return at certain seasons of the year; in youth, this disease frequently prevents, in others cures them.—But it sometimes degenerates into worse kinds.

There are two kinds of *itch*, a *humid* and a *dry*.

ITCH, *psora sicca*, *the*. The most obvious and general kind of the *itch* are the eruptions of pimples, or pustules, all over the whole surface of the body, each containing only the matter which contain, in the end, a tenuous and ulcerous ichor.

These pustules usually appear first in the hands, and other parts as are most exposed to the air, and from thence they gradually spread themselves all over the body. The body is more turgid in those places where the pustules are situated, than in a state of health; and these parts are attended with a violent itching, especially in the night. After a few days they either break of themselves, or are opened by scratching, and then become little ulcers; these, however, usually heal of themselves in a very little time, and leave no scar behind.

This kind of benign *itch* occupies no part of the skin, and indeed the matter always lies between the skin and the cuticula, whence the cutis not being deeply affected, the cuticle easily heals.

In the *benign moist itch*, the pustules contain a large quantity of matter, and when broken discharge a great deal of it; there is also round the basis of the pustules a kind of inflammatory red circle; and, in short, as it plainly that appears, the greater is the suppuration or ulcerations, in this kind, are deeper than in the former; the pustules rather give a sensation of pain than that of itching.

In the *benign dry itch*, the pustules are much smaller in this case, and are full of a limpid water, which does not excoriate the skin more superficially, and excites only a little itching, rather than any soreness or heat in the part.

The *malignant itch*, when of the serine kind, is known by some the scorbutic *itch*, is dry and scaly, rarely discovering shows bloody spots under the larger scales, and round about these is tinged with the florid red, sometimes to a red, sometimes to a livid, sometimes to a violet colour. The itching from this kind is much more violent than from the benign, and on any part of the body, either to hotter or colder, becomes almost intolerable. When the scabs and cuticle are scratched off, as is very frequently the case, the cutis underneath is seen red and bloody, but neither blood nor lymph are discharged from the scabs in some cases, in others a yellowish serous liquor runs out, and almost immediately hardens into a scab or cruft like that which was pulled off.

ITCH, *the venereal or lues*. This is usually rather dry than moist, and does not spread itself so quickly as the other kinds. It sometimes occupies the body in general, sometimes only particular places, as the thighs, the scrotum, or the face. At its first appearance there are usually felt certain little rumors under the skin; and after this there appears a scab which remains on the part a considerable time, and will not easily be removed or torn off. The pain of this is sharp and erosive, especially when it is exasperated by scratching; and while this is fixed to some one part, there are pains felt deep within the flesh in other places, which are most intolerable in the night; and in women the fluor albus, or whites is usually an attendant on it; and in men sometimes a gonorrhœa, sometimes bubos and other tumors; and in infants, who are thus affected, from the diseases of their parents, there are frequent excoriation, and often crisated and varicose excrescences of flesh about the anus.

ITCH, *the leprous*. In this the head is frequently affected, the pains are very violent, and the hair and skin very frequently

institution, and the same ceremony was observed in all their houses throughout the world.

JUBILEUS, or JUBILAUS, is used among the Romanists, to signify a religious who has been fifty years in a monastery, or an ecclesiastic who has been in orders fifty years.

Such veteran religious are dispensed with in some places from attending matins, or a strict observation of any other of their rules.

JUBILEUS is also extended to any man a hundred years old; and to a possession, or prescription for fifty years. *Si ager non inveniatur in scriptione, inquiratur de senioribus, quantum temporis fuit cum ultro; & si sub certo.* jubilæo *manifestè sine usurpatione, manuit in suorum.*

JUCADICE *arbor*, in *Botany*, a name by which some authors have called the *canella alba*, or wild cinnamon-tree.

JUCCA, in *Botany*, the name of a distinct genus of plants otherwise called YUCCA.

JUCKING, the notes of a cock partridge, inviting the hen to come to him. These serve the sportsmen in good stead for finding the places were they are.

JUCURUTA, a very beautiful species of owl, found in the Brazils, and variegated with black and yellow.

JUDÆ *auricula*. See AURICULA.

JUDAICUS *lapis*, a small, grey, soft, brittle stone, in form of an olive, having lines drawn regularly on its surface, as if they were formed by art. *Tab.* III. *Fossil. Cl.* 10.

It is of some use in physic; being supposed to be endued with a lithontriptic power; and therefore is given to dissolve the stone in the bladder. It is a kind of extraneous fossil, being a spine of an echinus marinus petrified. This stone has by many been supposed to be a fossile body in its native figure, but is really the remains of a spine of an echinus, filled with a plated spar. It is very common in Syria, and is sometimes found with us. See SPAR.

JUDAISM, the religious doctrine and rites of the JEWS. *Judaism* was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messias. For a complete system of *Judaism*, see the books of Moses. *Judaism* was anciently divided into several sects; the principal whereof were the Pharisees, Sadducees, and Essenians.

At present there are two sects among the Jews, viz. the Caraites, who admit of no rule of religion, but the law written by Moses; and the Rabbinists, who add to the law the traditions of the Talmud.

It has been observed, that *Judaism*, of all religions, is that which is the most rarely abjured. In the 18th of Edward I. the parliament granted the king a fifteenth for the expulsion of *Judaism*.

In England, formerly, the Jews and all their goods belonged to the chief lord where they lived, and he had such absolute property in them, that he might sell them; for they had no liberty to remove to another lord without leave. Mat. Paris tell us, that Henry III. sold the Jews to earl Richard his brother, for a term of years, that *quos vexavi exercendo, eos enriveravet*.

They were distinguished from the Christians both living and dying; for they had proper judges and courts wherein their causes were tried, and they wore a badge on their breast over their cloaths in shape of a table; and they were fined, if they stirred abroad without such badges. They were never buried in the country, but always brought up to London, and interred without the walls.

JUDAS *tree, cercis*, in *Botany*, a genus of the *decandria monogynia class*. Its characters are these: the flower has five petals, which are inserted in the empalement, and greatly resemble a papilionaceous flower; the standard is of one roundish petal, and the keel is composed of two petals; it has ten distinct stamina, four of which are longer than the rest; it has a long slender germen, which becomes an oblong pod, with an oblique point, having one cell, including several roundish compressed seeds. There are two species. Miller.

JUDDUCK, in *Ornithology*, the name commonly given, in England, to a small species of snipe, called by authors, *gallinago minima*, and in some places with us, the *gad*, or JACK *snipe*.

JUDE, or *the Epistle of* JUDE, a canonical book of the New Testament, written against the heretics, who by their impious doctrines and disorderly lives, corrupted the faith and good morals of the Christians. See EPISTLE.

In the early ages of Christianity, several rejected this Epistle, because the apocryphal books of Enoch, and the ascension of Moses, are quoted in it. Nevertheless it is to be found in all the ancient catalogues of the sacred writings; and Clement of Alexandria, Tertullian, and Origen, quote it as written by Jude, and reckon it among the books of sacred Scripture.

JUDGE, an officer appointed by the sovereign powers of any country, to distribute that justice to their subjects which they cannot administer in person.

The character of *judge* is part of the regal authority, whereof the king dwells himself.

The chief function of *judges* is for the trial of causes both civil and criminal.

The English *judges* are chosen out of the serjeants at law, and are constituted by letters patent. Their commissions are bounded with this limitation, *fecerint quod ad justitiam pertinent secundum legem & consuetudinem Angliæ*: and at their creation they take an oath, that they will indifferently minister justice to all them that shall have any suit or plea before them; and this they will not forbear to do, though the king by his letters, or by express word of mouth, should command the contrary: and they are answerable in body, land, and goods. 18 Ed. III. c. 1.

By the law of England all *judges* must derive their authority from the crown, by some commission warranted by law. The *judges* of the king's bench, common pleas, and the barons of the exchequer, are all (excepting the chief justice of the king's bench, who is created by writ) appointed by patent. Formerly they held their places only during the king's pleasure: but now, for the greater security of the liberty of the subject, by statute 13 Will. III. c. 2. their commissions are to be *quamdiu se bene gesserint*, and their salaries are ascertained and established: and by 1 Geo III. cap. 23. they are to continue, notwithstanding the demise of the crown; and their full salaries are absolutely secured to them during the continuance of their commissions. Though upon an address of both houses of parliament, they may be lawfully removed.

Judges must exercise their authority in a legal manner and hold their courts in their proper persons, for they cannot act by deputy, nor any way transfer their power to another, as the *judges* of ecclesiastical courts may. Yet when there are several *judges* in a court of record, the act of any one of them is effectual, provided their commissions do not require more: for likewise what is executed by a majority present, is the act of the court: but where they are equally divided in opinion, the cause is to be removed into the exchequer chamber, and for that purpose a rule is to be made, and the record certified, &c. Some things done by *judges* at their chambers, are accounted as done by the court; and that they may be prepared to hear what is to come before them, they are to have a paper of the causes to be heard, sent to them by the attorneys the day before they are spoken to; that if, upon reading the record of any cause, any special matter that arises should appear doubtful, they may satisfy themselves by consulting books.

The *judges* are bound by oath to determine according to the known laws and ancient customs of the realm. Their rule herein must be the judicial decisions, and resolutions upon the various cases that have occurred, and not their own arbitrary will and pleasure, or that of their prince. *Judges* are free from all prosecutions for any thing done by them in court, which appears to have been an error in their judgment. But for wilful corruption, they have been complained of to the star-chamber formerly, and may now be called to an account in parliament.

It has been said, that scandalous reflections on the *judges* in Westminster-hall are within the statute of *scandalum magnatum*.

Those who use threatening or reproachful words to a *judge* sitting in the courts, are guilty of a high misprision, and have been punished with large fines, imprisonment, and corporal punishment. Assaulting a *judge*, sitting in the court, by drawing a weapon, without any blow struck, is punishable with the loss of the right hand, imprisonment for life, and forfeiture of goods and chattels, and of the profits of the person's lands during life; and slaying the chancellor, treasurer, or the king's justices of either bench, justices in eyre, or justices of assize, and all other justices assigned to hear and determine, being in their places during their offices, is a species of treason by 25 Edw. III. c. 2. However the barons of the exchequer, as such, are not within the protection of this act. *Judges*, who become solicitors in a cause which they are to judge, and privately and extrajudicially tamper with witnesses, or labour jurors, may be dealt with according to the same capacity to which they basely degrade themselves. Bribery in *judges* is punishable by loss of office, fine, and imprisonment; and by the common law, bribery of *judges* in relation to a cause depending before them, has been punished as treason. If a *judge* ignorantly condemns a man to death for felony, when it is not felony; for this offence he shall be fined and imprisoned, and lose his office. If a *judge* who hath no jurisdiction of the cause, give judgment of death and award execution, which is executed, such *judge* is guilty of felony; and also the officer who executes the sentence. And if justices of the peace, on indictments of

trespass, arraign a man of felony and judge him to death, and he is executed, it is felony in them. A *judge* ought not to judge in his own cause, nor in pleas where he is party. It was formerly enacted, stat. 33 Hen. VIII. c. 24. that none should be justices of assize within the county where they were born, or do inhabit; but this is repealed by a late statute, 12 Geo. II. c. 27.

It was formerly held that by a justice's acceptance of any new name of dignity, his commission was determined; but this was remedied by statute 1 Edw. VI. c. 7. But it has been doubted, whether the dignity of baronet, created since that statute, is within the equity of it.

JUDGE, *itinerant*. See ITINERANT.

JUDGE, in *Scripture*, is applied to certain eminent persons chosen by God himself to govern the Jews, from the time of Joshua till the establishment of the kings.

The Hebrews were governed by fifteen *judges*, for the space of 340 years; viz. from the time of Othniel their first to that of Samuel their last *judge*.

The *judges* were not ordinary magistrates, but were appointed by God on extraordinary occasions, as, to head the armies, to deliver the people from their enemies, &c. —Salian has observed that they not only presided in courts of justice, but were also at the head of the councils, the armies, and of every thing that concerned the government of the state; though they never assumed the title either of princes, governors, or the like.

In some respects they resembled kings; viz. 1. In that their authority was given them for life, and not for a limited time. 2. They ruled alone, and without any dependency; which occasioned Josephus to call their state monarchical.

Salian remarks seven points wherein they differed from kings. 1. They were not hereditary. 2. They had no absolute power of life and death, but only according to the laws, and dependently upon them. 3. They never undertook war at their own pleasure, but only when they were commanded by God, or called to it by the people. 4. They exacted no tribute. 5. They did not succeed each other immediately, but after the death of one there was frequently an interval of several years before a successor was appointed. 6. They did not use the ensigns of sovereignty, the sceptre or diadem. 7. They had no authority to make any laws, but were only to take care of the observation of the laws of Moses.

JUDGES, *or book of* JUDGES, is a canonical book of the Old Testament, containing the history of the Israelite *judges*, whereof we have been speaking.

The author is not known; it is probable the work did not come from any single hand, being rather a collection of several little histories, which at first were separate, but were afterwards collected by Esdras, or Samuel, into a single volume; and in all likelihood, were taken from the ancient journals, annals, or memoirs, composed by the several *judges*.

JUDGMENT, a faculty of the soul, by which it perceives the relation between two, or more, ideas.

Thus, when we *judge*, that the sun is greater than the moon, the understanding first compares the two ideas of the sun and the moon; and, finding the idea of the sun greater than that of the moon, the will perfectly acquiesces in that perception, nor puts the mind upon any farther enquiry.

It is not the understanding then that *judges*, as is ordinarily thought; *judgments* and reasonings on the part of the understanding, are but mere perceptions; it is the will alone that *judges*, by acquiescing in what is represented to it by the understanding.

The only difference then between *perception*, *judgment*, and *reasoning*, so far as the understanding is concerned in them, is this; that it perceives a thing simply, without any relation to any other thing, in a simple perception; that it perceives the relation between two or more things, in *judgments*; and, lastly, that it perceives the relations that are between the relations of things in reasonings; so that all the operations of the understanding are in effect no more than pure perceptions.

Thus, when we perceive, for instance, twice 2, or 4, this is no more than a simple perception; when we *judge*, that twice 2 are 4, or that twice 2 are not 5, the understanding does no more than barely perceive the relation of equality that is between twice 2 and 4, or of inequality between twice 2 and 5. Farther, reason consists in perceiving the relation, not between two or more things, for that would be a *judgment*, but of two or more relations of two or more things: thus, when I conclude, that 4 being less than 6, twice 2 being 4, are by consequence less than 6; I perceive not only the relation of inequality between 2 and 4, and 6 (for this were only a *judgment*), but also the relation of inequality between the relation of twice 2 and 4, and the relation between 4 and 6; which constitutes a reasoning. The understanding therefore only perceives, and it is the will that *judges* and reasons, in assenting voluntarily to what the understanding represents.

Indeed, when the things which we consider appear clear, and perfectly evident, it seems as if it were not voluntary, that the mind consents to them; whence we are led to think, that it is not properly the will, but the understanding that *judges* of them.—But to clear this point, it must be observed, that the things which we consider, never appear entirely evident, till the understanding has examined them on all sides, and has perceived all the relations necessary to *judge* of them; whence it happens that the will, not being able to will any thing without knowledge, cannot act on the understanding; that is, cannot desire it to represent any thing new in its object, as having already viewed it on all sides that have any relation to the question in hand. It is obliged then to rest in what has been already represented, and to cease to agitate and disturb it any farther; in which cessation it is, that *judgment* consists.

This rest or *judgment*, then, not being free when things are in their last evidence, we are apt to imagine, that it is not the effect of the will. So long as there is any thing obscure in the subject that we consider, or that we are not fully satisfied that we have discovered every thing necessary to resolve the question, as it happens in most of those things that are difficult, and that contain various relations; we remain at liberty not to acquiesce: the will may command the understanding to pursue its enquiries farther, and to make new discoveries, whence it is, that we are more ready to allow the *judgments* formed on these subjects to be voluntary.

Most philosophers, however, maintain, that even the *judgments* which we form on obscure things are not voluntary; and will have our consenting to the truth to be an action of the understanding, which they call *assent*, to distinguish it from our consenting to goodness, which they attribute to the will, and call it *consent*.

But their error is owing to this, that in our present state we frequently see things to be evidently true, without the least reason to doubt of them; in which case the will is not at liberty either to give or refuse her assent: but it is not so in matters of goodness; there being nothing, which we do not know some reason for forbearing to love. So that we here perceive a manifest indifference and are fully convinced, that when we love any thing, even God, for instance, we use our liberty, and do it voluntarily. But the use we make of our liberty is not so apparent, when we consent to the truth, especially when it appears perfectly evident: and this leads us to think, that our consent to truth, that is, our *judgment* is not voluntary; as if an action, to be voluntary, must be indifferent; as if the blessed above did not love God voluntarily, because they cannot be divested from it by any other thing; nor we consent freely to this evident proposition, that twice 2 are 4, because we have no appearance of reason to dissuade us from it.

JUDGMENT, in a *Legal Sense*, is a sentence or decision pronounced by authority of a king, or other power, either by their own mouth, or by that of their judges, and officers, whom they appoint to administer justice in their stead.

Of *judgments*, some are definitive, others only preparatory, provisional, or interlocutory. See DEFINITIVE, INTERLOCUTORY, &c.

The ancient words of *judgment* are very significant, *Consideratum est*, &c. because *judgment* is ever given by the court, upon consideration had of the record and matter before them.—In every *judgment* there ought to be three persons, *actor*, *reus*, and *judex*; plaintiff or prosecutor, defendant, and judge.

JUDGMENT may be given not only upon the trial of the issue, but on a default, confession, demurrer, or an outlawry, which is a *judgment* in itself. After issue joined in a cause, the plaintiff may, if he thinks proper, accept of a *judgment* from the defendant; but on such a *judgment*, a writ of error may be had without putting in bail, which cannot be done on a *judgment* after verdict. All *judgments* given in courts of record must be entered; in order to which the plaintiff's attorney, four days after the record is brought into court, may, if the *judgment* is out, enter *judgment* by the usual course of the court; but he cannot do this sooner, because the defendant must have time to bring in a writ of error, or to find out matter for an arrest of *judgment*. The defendant may oblige the plaintiff to enter his *judgment*, in order that he may plead it to any other action; and *judgment* upon a demurrer to a declaration, &c. which does not pass upon the merits of the cause, is no bar to it, though other *judgments* may be pleaded in bar to any action brought again for the same thing. *Judgments* are to continue till they are reversed; but an action of debt will lie on a good *judgment*,

as well after a writ of error is brought, as before it. If a plaintiff does not take out an execution within a year and a day after *judgment* is obtained, the *judgment* muſt be revived by a SCIRE FACIAS.

JUDGMENTS *for crimes*, in caſe of treaſon or felony, muſt be by an expreſs ſentence, an out-lawry or abjuration: and no *judgment* can be inflicted contrary to law, or that is not appointed by act of parliament. Theſe *judgments* are of very different kinds; as in high treaſon the offender is ſentenced to be drawn, hanged, his entrails taken out and burnt, his head cut off, and his body quartered, &c. In petit treaſon the *judgment* is, to be drawn to the place of execution, and there hanged. But a woman in all caſes of high and petit treaſon, is to be drawn and burnt. All perſons, for felony, are to be hanged by the neck till dead. *Judgment* in miſpriſion of treaſon, is impriſonment for life: and for miſpriſion of felony, the offender is ſubject to a fine and impriſonment; and for crimes of an infamous nature, the *judgments* are diſcretionary in the breaſt of the court, and thoſe guilty are puniſhed by a fine, pillory, &c. See EXECUTION *of Criminals*.

JUDGMENTS *for debts*, are acknowledged by a perſon's giving a general warrant of attorney to any attorney of the court in which it is to be acknowledged, to appear for him at the ſuit of the party to whom the ſame is to be done, and to file common bail, receive a declaration, and then to plead *non ſum informatus*, I am not informed, or to let it paſs by *nihil dicit*, he ſays nothing; upon which *judgment* is entered for want of a plea. Judges that ſign *judgment* of lands, are to ſet down the day of the month and year in which they do it; and they ſhall be good againſt purchaſers only from ſuch ſigning. Where a perſon has acknowledged a *judgment* for the ſecurity of money, and afterwards on borrowing more money of another perſon, mortgages his lands, &c. without giving any notice of the *judgment* to the mortgagee; in ſuch caſe, if the mortgager do not within ſix months pay off and diſcharge the *judgment*, he ſhall forfeit his equity of redemption, 4 and 5 Will. and Mary. Acknowledging a *judgment* in the name of another perſon without his privity or conſent, is made felony, by 21 Jac. I. c. 26.

JUDGMENT, *Arreſt of*. See ARREST.

JUDGMENT, *Aſſigning falſe*. See ASSIGNING.

Judgment of God. See JUDICIUM *Dei*.

JUDGMENT, *Moſt of*. See MASS.

JUDGMENT, *Villainous*. See VILLAINOUS.

JUDICATURE, the quality, or profeſſion, of thoſe who adminiſter juſtice.

In which ſenſe *judicature* is a kind of prieſthood.—In France, offices of *judicature* are venal.

JUDICATURE is alſo uſed to ſignify the extent of the juriſdiction of the judge, and the court wherein he ſits to render juſtice.

JUDICE.—*Coram non* JUDICE. See CORAM.

JUDICIAL. See EXTRAJUDICIAL.

Judicial *Aſtrology*. See ASTROLOGY.

Judicial *Oratory*. See ORATORY.

Judicial *Writs*. See WRIT.

JUDICIALIS *Lex*. See LEX.

JUDICIARY *Aſtrology*. See ASTROLOGY.

JUDICIARY *Depoſit*. See DEPOSIT.

JUDICIO *Fulſo*. See FALSO.

JUDICIUM *Dei*, JUDGMENT of *God*, was a term anciently applied to all extraordinary trials of ſecret crimes; as thoſe by arms, and ſingle combat, and the ordeals; or thoſe by fire, or red-hot plough-ſhares; by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle rather than ſuffer truth and innocence to periſh.

Si ſuper defendere non poſſit, judicio Dei, *ſcil. aqua vel ferro ferrit de eo juſtitia*.

Theſe cuſtoms were a long time kept up, even among Chriſtians; and they are ſtill in uſe in ſome nations. See ORDEAL, WATER, COMBAT, DUEL, and CHAMPION.

Trials of this ſort were uſually held in churches, in preſence of the biſhops, prieſts and ſecular judges; after three days faſting, confeſſion, communion, and many abjurations and ceremonies, deſcribed at large by Du-Cange.

JUDICIUM *Aſſiſæ*. See ASSISE.

JUDICIUM *Parium* denotes a trial by a man's equals, i. e. of peers by peers, and of commoners by commoners. In *magna charta* it is more than once inſiſted on as the principal bulwark of our liberties, but eſpecially by chap. 29. that no freeman ſhall be hurt in either his perſon or property, *niſi per legale* judicium *parium ſuorum vel per legem terræ*. And this was ever eſteemed, in all countries, a privilege of the higheſt and moſt beneficial nature.

JUFFERS, among carpenters, a term uſed for pieces of wood about four or five inches ſquare, and of ſeveral lengths.

JUG, an earthen pot or pitcher to hold drink; alſo a term uſed in many parts for a common, paſture, or meadow.

JUGERUM, a Roman meaſure, the double of the *actus quadratus*. It was a ſquare of 120 Roman feet. The *jugerum* was divided into 12 *uncia*, and the *uncia* into 24 *ſcrupula*. Its proportion to the Engliſh acre is as 10000 to 10097.

JUGLANS, in *Botany*. See WALNUT TREE.

JUGLERS. See PROVENÇAL *Poets*.

JUGULAR, among *Anatomiſts*, is applied to certain veins of the neck, which terminate in the ſubclavians. See VEIN.

The *jugular veins* are two on each ſide; the one *external*, receiving the blood from the face, and the external parts of the head; the other *internal*, which receives the blood from the brain. See *Tab. Anat. (Angiol.) fig.* 6. *Lit. b. b.*

JUGULAR is alſo applied to certain glands in the neck, in the ſpaces between the muſcles.

The *jugular glands* are in number fourteen; they are of different figures, ſome larger, others leſs; they are faſtened to each other by certain membranes and veſſels; and their ſubſtance is like that of the maxillaries.

They ſeparate a lympha, which is conveyed by thoſe veſſels to the adjacent muſcles. It is an obſtruction in theſe glands which occaſions the *king's evil*.

JUGULARES, in the *Linnæan Syſtem*, is the name of an order or diviſion of fiſh, the general character of which is, that they have ventral fins before the pectoral fins. This order comprehends five genera, viz. *callionymus*, *uranoſcopus*, *trachinus*, *gadus*, and *blennius*, and thirty-five ſubordinate ſpecies.

JUICE, a liquid ſubſtance, which makes part of the compoſition of plants; being diffuſed among all the ſolid parts, and ſerving for their nutriment and growth.

The *juice*, or ſap, is that to PLANTS, which blood is to animals. See *Juices of* PLANTS.

There are *juices* of divers kinds, *aqueous*, *vinous*, *oleaginous*, *gummous*, *reſinous*, and *bituminous*; and of all taſtes and colours.

JUICE, *Spaniſh*. See LIQUORICE.

JUICE is alſo applied to ſeveral, and even to all, the fluids, or humours, in an animal body.

JUICE, *nervous* and *pancreatic*. See the adjectives.

JUICE is alſo applied to the vapours and humidities incloſed in the earth.

Thus cryſtal is ſaid to be formed of a lapidific *juice*, and metals to be generated of vapours and *juices* condenſed in the earth.

JUICES, *concrete*, in *Mineralogy*, a name given by many authors, to ſuch ſubſtances found in the bowels of the earth, as have once been in a ſtate of fluidity, and are capable of being rendered fluid again by art, by means of heat, moiſture, or other common agents.

Others apply the word *concrete* to all thoſe ſubſtances which may be ſeparated from fluids by chemical operations, whether they are afterwards ſoluble in them again or not; ſuch are the particles of ſpar, ſeparated from water by a ſlow diſtillation, and remaining at the bottom of the veſſel.

The concrete *juices* of the earth are ſuppoſed to be the principal things which give the virtue to mineral waters; for thoſe which receive no concretion, and are only mingled with the water in their paſſage through that part of the earth where they are evaporated, on the water's being expoſed to the air, though they may give a briſkneſs to it, while entire in it, yet are not to be ſuppoſed to give the principal virtues. Theſe fluid and volatile *juices* all fly off in the analyſes of the waters, but the concrete *juices* are more permanent, and leave certain ſediments which render them viſible and palpable, after the diſtillation of the waters with which they are mixed. When theſe happen to be ſimple, and of the ſame ſpecies with thoſe known in a ſolid ſtate, it is eaſy to deduce the virtues of the waters from them, and to know what muſt be the effect of ſuch fluids as carry ſpar, ſulphur, vitriol, or other well-known ſubſtances, into the blood; but it ſeldom happens that theſe things are thus contained ſimple and entire in the waters, they are often blended variouſly with one another, and often not the whole of the known body is contained, but the principles that conſtitute ſome part of it, ſuch as the acid of vitriol without its metalline part, the baſis of the ſea-ſalt without its acid, and ſo of the reſt.

Salts and earths are evidently the moſt ſenſible and the moſt common matters which are mixed with water, and it is from them in general that the medicinal ſprings take up their virtues. There is ſcarce any earth that does not contain ſome ſort of mineral ſalt, capable of being waſhed out by water, though it be generally in imperceptible quantities; but where the earths are richer in theſe ſalts, the waters not only take them up, but carry alſo with them the ſeveral finer particles of the earth itſelf in

which they are bedded, and rising up at ſome ſmall diſtance from the place, they make medicinal ſprings, of virtues anſwerable to the peculiar ſpecies of the ſalt that was lodged there. We are always able to ſeparate, by analyſis, the ſalts and the earths of the mineral waters; but when we have done this, we are not arrived at the end of the taſk, for they are often ſuch mixed ſubſtances, that we can neither know them perfectly as they are, nor ſeparate them.

The four moſt known and frequent of thoſe concrete *juices* which are called ſalts, are alum, nitre, vitriol, and culinary ſalt; but the examination of the water of different medicinal ſprings ſhews us, that there are in the earth others very different from theſe, and that perhaps in great numbers. There is in Aſia a native alkali ſalt, or natrum, and in all the mineral waters we celebrate, there is a peculiar ſort ſeparable by evaporation, which is nearer allied to this than to any of the other four, to one or other of which it has been the cuſtom to reduce all ſalts; and yet different even from this in ſome reſpects. Beſide this, thoſe *juices* of the ſaline kind, whoſe diſpoſition to concretion is not yet finiſhed, and whoſe ſtate is, as it were, but in embryo, or the firſt ſtage of being, are not to be known, when ſeparated from the waters to which yet they may have perhaps given virtues greater than the concrete, in what we call its more perfect ſtate, might have given: nay, even thoſe that are more formed, and are already concreted, or in a ſtate capable of concretion, have not ſimple and homogeneous ſubſtances in each of the ſpecies. The ſalt that is called culinary ſalt, is obſerved to have two different portions mixed together; the one is condenſed and cryſtallized by cold and in moiſture, after the evaporation of a part of the water wherein this ſalt hath been diſſolved; and the other will not be cryſtallized nor condenſed, but by a total evaporation of the water. The portion of this ſalt that is cryſtallized by cold and in moiſture, is the moſt ſulphureous, and by its ſulphureity it will mix itſelf with the ſulphureous ſalt of calcined tartar reſolved in a moiſt air, or in common water, without turbidneſs, and without coagulation; but that portion of this common ſalt which is not condenſed but by the total evaporation of the water which had diſſolved it, hath an acidity which inſtantly coagulates the ſalt of tartar diſſolved, and all other ſalts in the ſame ſtate which are ſulphureous and nitrous. It is evident, that while this ſalt is in its embryo ſtate, the one or the other alone of theſe two very different ſubſtances of which it is contained, may be mixed with the waters of a ſpring, and communicate virtues different from thoſe which the whole body of the ſalt would have done. This ſalt alſo being procured by evaporation of the water, or by any other analyſis of it, could not be known or referred to the common ſalts, and much leſs if in the earth, as may very eaſily happen, it ſhould be united with ſome one of the conſtituent parts of ſome other ſalt, in the ſame diſunited or unfaſhioned ſtate.

The vitriol which in a moiſt air yields an efflorescence upon ſulphureous marcaſites, has likewiſe a juicy portion, condenſible only by a total evaporation of its aqueous humidity; this is of a very acrimonious taſte, of an unctuous ſubſtance, and eaſily runs to water in a moiſt air. This juicy portion of vitriol is very different from that which ſhoots and condenſes in the fluid liquor, by means of the cold. Theſe cryſtals are pure vitriol acid, auſtere, and on being mixed with the ſulphureous and nitrous ſalts, a great quantity of earthy matter precipitates out of them; but the other portion will mix itſelf with theſe ſalts in ſolution, without turbidneſs or emotion, not having, like the former, that acidity upon which the ſulphureous or nitrous ſalts can act; which is exactly contrary to what happens to common ſalt, of which the firſt portion is the moſt ſulphureous, and the latter portion the moſt acid. Nitre is alſo, like the reſt, compoſed of two different ſaline portions, the one more ſulphureous, which cryſtallizes with the cold, and in moiſture, and the other, which remains diſſolved after all the cryſtals are obtained, and which cannot be obtained in a dry form, but by the evaporation of all the humidity. This is leſs ſulphureous than the other part obtained in cryſtals, and has ſome acidity which the other has not.

The firſt embryos of mineral ſalts are nothing elſe but vapours or *juices* not concreted, but totally volatile or vaporable; of theſe ſome may be condenſed, and in part fixed by the action of fire, or diſengaged from their matrices, and made capable of concretion by means of the air, as is obſerved in certain nitrous, aluminous, and vitriolic ſalts. The ſulphureous part, which is formed in the lime, made of certain hard ſtones burnt in the fire which is generally allowed to be a ſpecies of nitre, has certainly its ſeminal being in theſe crude ſtones, and in that ſtate of its being, is very different from that which we find after it has paſſed the fire, which from cold and coagulative, changes into cauſtic and reſolutive. This cold and coagulative quantity of this ſtony ſalt, in its firſt ſtate, manifeſts itſelf ſufficiently in the waters of certain rock ſprings, which are very limpid and cold, and breed cold and ſcirrhous tumors under the throats of thoſe people who ordinarily drink them, as in the Alps, &c. See BRONCHOCELE.

The ſeminal matter of this ſalt then is wholly altered in its nature by fire, and is rendered ſulphurous and cauſtic as nitre. Fire is able to exalt and alter the ſtate of being of this ſalt, but it is no more able to produce it in theſe ſtones, than in the ſhells of oyſters, &c. of which alſo a lime is made, which yields a ſalt not more ſulphurous than this. Du Clos, Obſerv. ſur les Eaux Miner.

The ſeminal being of alum and vitriol muſt, in the ſame manner, exiſt in thoſe ſubſtances out of which thoſe ſalts are extracted by water, after they have been calcined by fire, or expoſed to a flower calcination in the open air. They are not found in theſe ſtones before theſe proceſſes, yet is it ſufficiently evident that the fire and air could not produce them, but could only exalt them there.

All theſe varieties to which the ſeveral mineral ſalts are liable in the different ſtages, and in which they may be abſorbed together, and united by water under the earth, do not only render the judging of the *mineral* WATERS, which partake of them, by analyſes very uncertain, but even, in many caſes, perplex and confound us, by the very means by which we hope to underſtand them.

JUICES, *mineral*. Many countries afford theſe, and give marks by them of treaſures that might be turned to great account, were the proper manner of aſſaying them known, which is by firſt properly reducing them to a dry ſubſtance, ſo as to come at the ſolid matter they contain. With a view to the diſcovery of metallic veins, the erection of ſalt-works, vitriol-works, alum-works, borax-works, and the like, the curious on this ſubject may find many excellent hints for farther diſcoveries in the cloſe of Agricola's work, *De Re metallica*; and the view is farther carried on by Boyle, Becher, Stahl, and Homberg. The Royal Academy of Paris have alſo given ſome hints that may be of uſe, in their Memoirs; and ſome practical things are recorded in the Philoſophical Tranſactions. We have accounts in the Philoſophical Tranſactions, of white and thick fluids like cream, found in mines at very great depths, and containing mineral particles. The bottoms of our coal-pits ſometimes afford this liquor in very large quantities. And ſome of the iron mines in Shropſhire, particularly that called the White-Mine near Hales in that county, affords a great quantity of this ſort of *juice*. It is thick as cream, white, and of a ſweetiſh taſte, but with a vitriolic twang behind it. This is contained in the nodules of iron ſtone, which are here a ſort of enhydri, very large, compoſed of thick cruſts, and ſome of them holding near a hogſhead of this ſort of liquor. Phil. Tranſ. N° 100. See ENHYDROS.

JUJUBE, or JUJUB, *zizyphus*, in *Botany*. Its characters are theſe: the flower has no empalement, but has one funnel-ſhapped petal, which ſpreads open at the top, and is cut into four or five ſegments; it has five awl-ſhaped ſtamina, whoſe baſes are inſerted into the petal, and are terminated by ſmall ſummits; it has an oval germen ſupporting two ſlender ſtyles, crowned by obtuſe ſtigmas and which becomes an oblong oval berry, incloſing a ſingle nut of the ſame form, which has two cells, each containing an oblong ſeed. There are four ſpecies, natives of the Eaſt, and of the warm parts of Europe, which are preſerved in the gardens of the curious. They are propagated by planting their ſtones in pots of light earth, ſoon after the fruit is ripe, and in winter they ſhould be preſerved under a common hot-bed frame, where they may be defended from the ſeverer froſts, and in ſpring the pots ſhould be plunged into a moderate hot-bed. When the young plants are come up, they ſhould be enured to the open air by degrees, and in June they may be removed out, and placed under the ſhelter of a warm hedge. In this place, they ſhould remain till the beginning of October, when they are to be removed into the green-houſe, or elſe placed under a hot-bed frame, that they may be preſerved from the froſts. During the winter they ſhould have as much air as the ſeaſon will permit, and be watered at times, though this muſt be very cautiouſly done, after they have ſhed their leaves. In the March following, before they begin to ſhoot, they are to be tranſplanted each into a ſeparate pot of light earth, and they ſhould then be plunged into a moderate hot-bed, and watered and ſhaded till they have taken thorough root; and in May they are to be removed thence into the open air. They muſt be houſed in winter till they are about four years old, and then may be tranſplanted into the naked ground, and will ſtand our winters. Miller.

The *nazyphus*, according to Linnæus, is only a species of rhamnus, with oval leaves, and two styles; the fruit, or nucleus of which, contains two cells, and its corolla has five segments. See BUCKTHORN.

It is a native of Spain and Italy; and the fruit, which is of the bigness of an olive, and reddish when ripe, was once esteemed as a pectoral, and sometimes prescribed in fevers; but is disregarded in the present practice. In Italy and Spain this fruit is served up at the table in deserts, during the winter season, as a dry sweetmeat.

JULEP, or JULAP, JULAPIUM, in *Pharmacy*, and derived, according to Menage, from the Arabic *gulab*, or rather from the Greek ροδομελι: Oribasius derives it from *gulap*, a Persian word, signifying *rosamutter*; is an easy, agreeable, extemporaneous potion, prescribed to sick persons; usually composed of cordial waters, or simple distilled water, with one third or one fourth its quantity of distilled spirituous waters, and sweetened with sugar, or proper syrups. This is sometimes with vegetable or mineral acids, or impregnated with other medicines. *Julaps* are sometimes used as the ordinary drink in vertiginous diseases, but more usually as a vehicle for other forms of medicines; serving chiefly to dilute, to correct the acrimony of the humours, restore the declining force of the heart, and promote sweat.

In dispensatories, we have several different *julaps*; the principal of which are,

JULEP, *camphor*, *julapium e camphora*, a medicine prescribed in the late London Dispensatory, and seeming the best calculated of any thing of the kind, to communicate the virtues of camphor to water. It is made thus: take camphor, a dram; fine sugar, half an ounce; boiling water, a pint: grind the camphor with a little spirit of wine till it is fottened, then add the sugar, and by degrees perfectly unite these; finally add the water by a little at a time, and when the whole has stood in a covered vessel till it is cold, strain it off.

Others direct the *camphorated julap* to be made by grinding one dram of camphor with a little spirit of wine, then adding half an ounce of gum arabic reduced to a mucilage, with an equal quantity of water, and rubbing them together till they are perfectly united. To this mixture add, by little and little, a pint of vinegar, with an ounce of double-refined sugar dissolved in it, still continuing the trituration. This *julap* may be taken in the dose of a spoonful or two, in hysterical and other complaints where CAMPHOR is proper.

The *cordial julap* is made, by mixing four ounces of simple cinnamon-water, two ounces of Jamaica pepper water, volatile aromatic spirit, and compound spirit of lavender, of each two drams, and an ounce of syrup of orange-peel; and is given in the dose of two spoonfuls, three or four times a day, in disorders accompanied with great weakness and depression of spirits.

The *expectorating julap* is formed, by mixing four ounces of the EMULSION of gum ammoniac with two ounces of the syrup of squills. Two table-spoonfuls of this *julap* may be taken every three or four hours in coughs, asthmas, and obstructions of the breast.

Moschjulap is made, by rubbing half a dram of musk, and half an ounce of sugar together, and adding gradually two ounces of simple cinnamon-water, and as much of peppermint-water, and also two drams of the volatile aromatic spirit. Two table-spoonfuls of this *julap* may be taken every two or three hours, in a low state of nervous fevers, hiccupings, convulsions, and other spasmodic affections.

The *sabine julap* is prepared by dissolving two drams of salt of tartar, in three ounces of fresh lemon juice, strained; when the effervescence is over, add of mint-water, and common water, each two ounces, and of simple syrup one ounce. This *julap* removes sickness at the stomach, relieves vomiting, promotes perspiration, and may be of service in fevers, especially of the inflammatory kind.

The *vomiting julap* is made, by dissolving four grains of emetic tartar in eight ounces of water, and adding to it half an ounce of the syrup of clove July-flowers. This *julap* may be given, in the beginning of fevers, in the dose of one table-spoonful every quarter of an hour till it operates. Buchan.

MEPHITIC *julap*. See PYRMONT *water*.

JULIA, in *Ichthyology*, a name given by Salvian and Gaza, to the *iouloi* of the Greeks, called *julis* by the Latin writers in general, and by the Italians, *donzella*. It is a species of the LABRUS, according to Artedi, and is distinguished by that author from the other fish of that kind, by the name of the variegated labrus of a palm long, and having two larger teeth in the upper jaw.

JULIAN *calendar*, *epocha*, and *period*, see the substantives.

JULIAN *laws*. See PAPIAN *or* POPPIAN *laws*.

JULIAN *year*. The *Julian* is the old account of the year, used among us in England till 1752. It is so called from its founder Julius Cæsar; and by that name is distinguished from the new, or Gregorian account, used in most parts of Europe. See YEAR.

JULIFLOWER, in *Botany*, see *Dame's* VIOLET.

JULIS, in *Ichthyology*, the name of a small fish, a species of the *labrus*, caught principally about Genoa, and sold in the markets, being a very delicate eating fish. Its usual size is about the length, and a little more than the breadth of a finger. The males of this species are very beautifully painted. Their backs are green, and their heads have variegations of yellow and red. Its fides have very broad serrated lines of a fine gold yellow, and its back fin has several large spots of blue and red. They are fond of human blood, and will fasten upon the legs of people who walk naked into the water.

JULUS, IULUS, derived from ἰουλος, whence *iuli*, *a sheaf*, in *Antiquity*, an ancient hymn sung by the Greeks, and, after them, by the Romans, during the time of their harvest, in honour of Ceres and Bacchus, to render those deities propitious.

This hymn was sometimes also called *Demetrius*, or *Demetrius*; that is, *Iulus* of Ceres.

JULUS, in *Botany*, is a name given to those worm-like rufts, or palms (as they are called in willows), which, at the beginning of the year, grow out, and hang pendulous down, from hazels, walnut-trees, oaks, chesnut-trees, mulberry-trees, ashes, &c. and are by us popularly called CATKINS.

Mr. Ray observes, that they are collections of the stamina of the flowers of the tree; because in fertile trees and plants, they have abundance of seminal apparatus: which opinion is adopted by Bradley, who makes them to be the male blossoms, and to serve to impregnate the rudiments of the fruit, or female blossoms, which appear on the same trees, or others of the same sort.

JUNCUS, see GALLITRICH.

JULY, in *Chronology*, the seventh month of the year, during which the sun enters the sign Leo. The word is derived from the Latin *Julius*, the surname of C. Cæsar the dictator, who was born in it. Mark Antony first gave this month the name *July*, which was before called *Quintilis*, as being the fifth month of the year, in the old Roman calendar established by Romulus, which began in the month of March. For the same reason, Auguft was called *Sextilis*; and September, October, November, and December, still retain the name of their first rank.

Quæ sequitur, numero turba notata fuo.

On the third day of this month the dog days are commonly supposed to begin, and to end on the eleventh day of Auguft. See CANICULAR *days*.

JULY *flowers*, or GILLYFLOWERS, in *Botany*, see PINK.

JULY *flower*, *clove*. See DIANTHUS and PINK.

JULY, *queen's*, *flower*. See *Dame's* VIOLET.

JULY, *stock flower*. See STOCK, &c.

JUNCAGO, *rush-grass*, in *Botany*, see TRIGLOCHIN.

JUNCI *Lapides*, in *Natural History*, the name given by authors to a species of fusille coral, of the *tubularia* kind, and composed of a congeries of small tubules, which are usually round and striated within. See *Tab. of Fossils, class 3*.

JUNCO, in *Zoology*, see *Reed* SPARROW.

JUNCO is also used by Bellonius as a bird, seeming, by his description, the same with what we call the WIMP.

JUNCTURE, any joint, or closing, of two bodies. See JOINT.

JUNCTURE, in *Oratory*, is a part of COMPOSITION, particularly recommended by Quintilian, and denotes such an attention to the nature of the vowels, consonants, and syllables in the connection of words, with regard to their sound, as will render the pronunciation most easy and pleasant, and best promote the harmony of the sentence. Thus the coalition of two vowels, occasioning an hollow and obscure sound, and likewise of some consonants, rendering it harsh and rough, should be avoided: nor should the same syllable be repeated at the beginning and end of words, because the sound becomes hereby harsh and unpleasant. The following verse in Virgil's Æneid is an example of *juncture*.

Arma virumque cano, Troja qui primus ab oris.

JUNCUS, in *Botany*, see RUSH.

JUNCUS *odoratus*, see SCHÆNANTH.

JUNE, the fifth month of the year, during which the sun enters the sign of Cancer. The word comes from the Latin *Junius*, which some derive *a Junone*. Ovid, in the sixth of his *Fasti*, makes the goddess say,

Junius a nostro nomine nomen habet.

Others rather derive it *a junioribus*, this being for young people, as the month of May was for old ones.

Junius ex senibus, qui fuit ante, fuum.

In this month is the summer solstice.

JUNGERMANNIA, in *Botany*, the name of a genus of plants of the class *cryptogamia algæ*, called by Dillenius, LICHENASTRUM, and some of the species are called by Micheli by this name; others by that of *muscoides*.

The characters of the *jungermannia* are these: it produces both male and female flowers, and these are often found both upon the same plant; the male flower stands upon a long pedicle, which arises from a sort of cup or case on the leaf; this has no cup, no petals, nor any stamina, but is only one single anthera or apex, which is at first of an oval figure, but being composed of four valves, it opens when ripe into four segments, and remains in this state a long time upon the plant; the female part of fructification, as it may be much more properly called than flower, consists only of seeds, so far as we are able to observe, for there is no appearance of either cup or petals; but the seeds are found in some species singly, in others in clusters on different parts of the leaves.

JUNIPA, in *Botany*, the name of a tree of the Caribbee islands, and some other places, the fruit of which is said to yield a juice as clear as water, yet yields a fine violet coloured dye, and being rubbed twice on the same place, makes it black. This tincture, it is said, cannot be got out by soap, or any other method of cleansing, but after nine or ten days disappears of itself. It is said also by the same authors, that hogs and parrots, feeding on this fruit, have their flesh and their fat all tinged throughout of a violet colour.

JUNIPER, *juniperus*, in *Botany*, a genus of the *dioecia monadelphia* class. Its characters are these: it hath male and female flowers on different plants, and sometimes at separate distances on the same plant; the male flowers have a conical catkin; the flowers are placed by threes, opposite each other, and terminated by a single one; the scales are broad, lying on each other, and fixed to the column by a very short foot stalk: the flower has no petal; but three stamina, joined in one body below; the female flowers have a small three-pointed empalement, sitting upon the germen; and they have three stiff, acute, permanent petals, and three styles; the germen sitting below the empalement, becomes a roundish berry, inclosing three stony seeds, which are oblong, angular on one side, but convex on the other. Miller.

The confusion in names that has arisen from the calling some of the *junipers* by the name of CEDAR, is as old as Theophrastus. In the days of this author the Greeks plainly did not distinguish between the names *juniper* and cedar, but applied them indifferently to the same trees; and all the authors since have more or less given into it. The fruit or berries of the shrub *juniperus*, which is common on heaths in different parts of Europe, is much used in medicine.

These berries, which are first green, and when ripe of a dark purple colour, ripen in the autumn. They are chiefly brought to us from Holland and Italy; and should be chosen fresh, not much shrivelled, and free from mouldiness. The sweetness of these berries appears to reside in the juice, or soft pulpy part; the bitterness in the seeds; and the aromatic flavour in oily vesicles, spread throughout the substance, both of the pulp and of the seeds, and distinguishable even by the eye.

Juniper berries give out nearly all their virtue, both to water and rectified spirit, tinging the former of a brownish yellow, and the latter of a bright orange colour. Distilled with water, they yield a yellowish essential oil, very subtile and pungent, resembling the berries in smell, and in quantity, when the berries have been sufficiently bruised, about one ounce from forty. This oil is a very stimulating diuretic; the decoction inspissated to the consistence of a rob or extract, has a pleasant, balsamic, sweet taste, with a greater or less degree of bitterness. This extract may be used with advantage in cases where the more stimulating preparations would be improper; as in catarrhs, debilities of the stomach and intestines, and difficultiess of the urinary excretions, in persons of an advanced age. Among the aromatics that have been tried in composition with *juniper* berries, sweet fennel seeds, and caraway seeds, seem the best adapted to improve their flavour. A cordial water is prepared in the shops, by drawing off a gallon of proof-spirit from a pound of the berries, and an ounce and a half of each of the seeds. To this water may be usefully superadded, a proper quantity of the rob. Lewis.

Etmuller had a vast opinion of *juniper berries*: the rob made of the expressed juice of the green berries has been called by many, the *theriaca Germanorum*; so much are they esteemed by that nation for their alexipharmic qualities.

They are certainly carminative; but their most remarkable properties are, in scouring the viscera, and particularly the reins and urinary passages, as all things of the turpentine kind do; for which reason they are of great service in ulcuses, cachexies, the jaundice, colic, the stone of the bladder and kidnies, as also in crudities of the stomach.

The wood of this shrub is also of considerable use in physic; it strengthens the stomach, expels wind, clears the lungs, provokes the menses, and removes obstructions of the viscera: it is farther said to be sudorific, cephalic, and hysteric. From it they draw a spirit, a tincture, an elixir, extract, and a ratafia.

It is said it will last a hundred years without corrupting: the chemists add, that a coal of *juni er*, covered with ashes of the same kind, will keep on fire an entire year.

From a larger species of *juniper*, the gum SANDARACHA is obtained.

JUNK, in *Sea-language*, a name given to any remnants or pieces of old cable, which is usually cut into small portions, for the purpose of making points, mats, caskets, sennit, &c.

JUNO, in the *Heathen Mythology*, a goddess; the daughter of Saturn and Ops, the sister and wife of Jupiter: she is otherwise called Lucina.

Juno, as well as Jupiter, had a great variety of characters among the ancients; but the favourite one of them all, among the Romans, was that of the *Juno Sospita*, dressed like the Roman matrons in a long robe; which covered her from head to foot. The figures of the Roman empresses were often formed under this character of *Juno*. Such is the statue of Sabina, at the Villa Mattei in Rome. This *Juno* was called indifferently, *Juno Matrona* and *Juno Romana*. The *Juno Regina*, and *Juno Moneta*, are always represented on the ancient gems and medals, in a very fine and magnificent dress. We may observe, that Virgil, Æn. i. v. 17. and Æn. ii. v. 614. speaks of *Juno*, not according to the appearance she used to make among the Romans, but according to the representations of her in other countries. In one place, where he describes her arms and military chariot, he speaks of the Carthaginian *Juno*; and in the other, he has given her an angry and warlike figure, which belongs to the *Juno Argiva*, or some particular *Juno* of the Greeks. However, the *Juno Sospita* among the Romans, appears on several medals in a war chariot, and with a spear in her hand. There was also a mild *Juno*, as well as mild Jupiter, among the Romans; under which character, her face appeared more gentle and good-humoured than usual: but the most obvious and striking character of *Juno*, which we derive from the writings of Homer and Virgil, is that of an imperious and haughty wife. These poets oftener represent her scolding at Jupiter, than caressing him. Nevertheless, she was anciently considered as the great patroness of marriage and a wedded life. *Juno*, under the character of presiding over the air, is represented in a light car, drawn by peacocks, and attended by the *Aura*, or nymphs of the air. See JUPITER *infra*.

JUNO, in *Astronomy*, a name given by some to the second satellite of Jupiter.

JUNONES. See GENIUS.

JUNTA, called also JUNTO, and JUNCTO, a council, or company, of several persons, meeting for the dispatch of any business.

The term is particularly used in the Spanish and Portuguese affairs.—On the death of Charles II. king of Spain, the kingdom was governed, during the absence of Philip V. by a *junta*.

In Portugal they have three considerable *juntas*; the *junta* of *commerce*, that of the *three estates*, and that of *tobacco*. The first was established by King John IV this is a council of marine. The same king also assembled the states of his kingdom, to create the tribunal of the *junta* of the three estates. King Peter II. created the *junta* of Tobacco, in 1675; it consists of a president and six counsellors.

IVORY, the tooth, or tusk, of an elephant, growing on each side of his trunk, somewhat in form of a horn.

Ivory is much esteemed for its colour, its polish, and the fineness of its grain when wrought. Dioscorides says, that by boiling it the space of six hours with the root of mandragoras, it becomes so soft and tractable, that any one may manage it as he pleases.

In the history of the French Academy, for the years 1742, and 1743, there is an account that M. Geoffroy produced before the academy, a small *ivory* spoon, which, by lying long in mustard, was become flexible and transparent like horn; that M. Fouchy saw an *ivory* spoon, which, by lying for a considerable time in milk, was become supple like leather; and that M. Hunauld produced bones which had been softened by steeping in vinegar, afterwards hardened to their natural state by steeping in water, and softened a second time by vinegar. Dr. Lewis has observed, that the nitrous and marine acids diluted, and the acetous acid, make bones flexible and tough like leather; but that the diluted vitriolic acid, though it softens them to a considerable degree, makes them at the same time brittle: nor has he found, that the softened bones, whatever acid they were softened by, recovered

recovered their hardneſs by ſleeping in water. Slips of ſoftened *ivory*, after lying above a month in water, continued nearly as laſt as when they were taken out of the acid liquor. *Ivory* may be ſoftened and whitened by boiling red ſage leaves in thrice-diſtilled white wine vinegar, with a little quick-lime, and putting in the *ivory* while the liquor is boiling hot: *Ivory* may be alſo whitened and cleaned from ſpots, by laying it in quick-lime, and pouring a little water on it: the quantity of water ſhould be ſmall, leſt the heat be too great, and the *ivory* ſcale and become brittle.

The *ivory* of the iſle of Ceylon, and that of the iſland of Achem, have this peculiarity, that they never become yellow, as thoſe of the Terra Firma, and Eaſt Indies do; on which account the former are much dearer.

A green dye may be given to ivory, by ſleeping it in aqua fortis, tinged with copper or verdigriſe, or in two parts of verdigriſe and one of ſal ammoniac, ground well together, with ſtrong white-wine vinegar poured on them. And by converting the aqua fortis into aqua regia, by diſſolving a fourth part of its weight of ſal ammoniac in it, *ivory* may be ſtained of a fine purple colour.

Ivory, bone, horn, and other ſolid parts of animals, may be ſtained black, in the ſame manner as WOOD. Theſe ſubſtances may be ſtained yellow, by boiling them firſt in a ſolution of one pound of alum, in two quarts of water; and then, having prepared a tincture of the French berries, by boiling half a pound of the berries, pounded, in a gallon of water, putting them into this tincture, after it has boiled about an hour, and letting them remain there half an hour. Turmeric root may be uſed inſtead of the berries; but in this caſe the *ivory*, &c. muſt be dipt in alum-water after it is taken out of the tincture. *Ivory*, &c. may be ſtained blue, by firſt ſtaining it green, and then dipping it in a ſolution of pearl-aſhes made ſtrong, and boiling hot: or it may be otherwiſe boiled in the tincture of indigo, prepared by the dyers: and afterwards in a ſolution of tartar, made by diſſolving three ounces of white tartar, or cream of tartar, in a quart of water. For other proceſſes and colours, ſee DYEING *of Bone, &c. Colouring* and *Staining* of BONE, and TORTOISE *ſhell*.

Ivory may be prepared as a ground for MINIATURE painting, by cleaning the *ivory* leaves or tables, and rubbing them over with the juice of garlic. This is ſaid to be more eſſential for taking off the greaſineſs, which prevents the colours from ſticking on the ground, than ſo-por-gall.

Ivory has the ſame medical virtues with hartſhorn; its ſhavings too, like thoſe of hartſhorn, boil into a jelly with water, and has the ſame reſtorative quality. See HARTSHORN.

IVORY *Black*. See *Ivory* BLACK.

IVORY, *Foſſile*. The abundance of elephants teeth found buried in different parts of the world, and many of thoſe parts ſuch as no elephant is ever known to have lived in, have given great amuſement to naturaliſts.

The long tuſks, which are what we call *ivory*, are the only teeth the vulgar are acquainted with in this creature, yet even theſe, in their foſſile ſtate, have often been miſtaken for horns, or other animal parts. The grinders of this animal are ſo enormouſly large, and of ſo ſingular a ſhape, that it requires ſome knowledge in natural hiſtory to diſcover them at ſight, and many have miſtaken them when impreſſed, for parts of a petrified ſhell-fiſh of the nautiles kind, their root being hollowed all along, and armed with an indented ridge on each ſide, in the manner of the back parts of ſome ſhells of that and of the cornu Ammonis kind.

We are not to wonder that the teeth of elephants are found more frequently than any other bones of the animal, ſince their uſe in the creature required that they ſhould be harder than any other bone, and that hardneſs has preſerved them in places where the other bones have periſhed. The different ſtate in which theſe teeth are found, is wholly owing to the different juices abounding in the earth in the place where they were depoſited, ſome of thoſe juices being of power to preſerve, others to deſtroy them; ſome eating them inſenſibly away, ſome as it were calcining them by ſlow degrees, and others rendering them greatly more hard and durable than before. Mem. Acad. Par. 1727.

Count Marſigli, and ſome other writers, have thought it an eaſy ſolution of the queſtion of the teeth and bones of elephants being found in countries where elephants are not naturally found, that we owe them to the Romans, who bringing them over for their uſe in war, buried them wherever they happened to die. But Sir Hans Sloane expreſſes himſelf very fully againſt this opinion: he obſerves, that of the remains of elephants found in Europe, nothing is ſo common as the *ivory* tuſks. Now, as he well obſerves, the Romans held ivory in the higheſt eſteem, and it ſold among them at a great price; wherefore had they been the buriers of theſe elephants, they would certainly have taken away the *ivory* tuſks firſt. It is certain, therefore, that accident, and not deſign, hath buried theſe bones, and that accident can have been no other than ſome prodigious inundation. Woodward is deſirous of making the univerſal deluge to have done all this, but that ſeems not neceſſary to be ſuppoſed in every caſe. Sir Hans Sloane gives an enumeration of the moſt curious of theſe pieces of foſſile *ivory*, which his own cabinet contained, and of ſome others of the moſt remarkable, mentioned by authors; from which we may form a very diſtinct idea both of the nature of the bodies themſelves, and of the places where they are uſually met with. See Philoſ. Tranſ. N° 463. p. 458.

The power of ſubterraneah calcinations to render things of this kind brittle, is remarked by the ſame author from Moreton's Hiſtory of Northamptonſhire, in the inſtance of a foſſile tuſk of an elephant which was in the whole at leaſt ſix feet long, and had preſerved its natural whiteneſs, though rendered ſo brittle as to fall into ſeveral pieces in the digging. This was dug up near Little Bowden, in Northamptonſhire; and the ſtrata of the place where it lay, were as follows: 1. Vegetable mould fourteen inches. 2. Loam a foot and half. 3. Large pebbles, with a ſmall mixture of earth among them, two foot and a half. 4. Blue clay; in the upper part of this laſt ſtratum, the tooth was found.

Sir Hans mentions another elephant's tuſk very entire and ſound, found in Siberia. The like are common in Siberia and many parts of Ruſſia, and are ſo little injured, that they are uſed as *ivory*, and are ſuppoſed to be the teeth of a vaſt animal called the *mammuth*, which they think lives under ground. Phil. Tranſ. N° 468. See farther on this ſubject, ELEPHANT'S *Bones*.

JUPATUMA, in *Zoology*, a name by which ſome call a very remarkable American animal, known among us by the name of the opoſſum.

JUPITER, or JOVE, in the *Heathen Mythology*, the ſovereign god of the heathens; the ſon of Saturn and Ops; born in the iſland of Crete, at the ſame birth with Juno: he married Juno, expelled his father out of his kingdom, and divided the kingdom of the world with his brethren. Under ſeveral ſhapes he is ſaid to have played many wanton pranks; ſo that according to poetic fiction, he filled heaven with his natural children.

As mankind are directed by an internal ſpirit or mind, the univerſe alſo is governed by an over-ruling intelligence; which as the cauſe and preſerver of all animal beings, was called Ζευς ὁ Ζωυς. See GOD.

The heathens in general believed that there was but one ſupreme God; but when they conſidered this one great being as influencing the affairs of the world, they gave him as many different names; and hence proceeded their variety of nominal gods. When he thundered or lightned, they called him *Jupiter*; when he calmed the ſea, Neptune; when he guided their councils, Minerva; and when he gave them ſtrength in battle, Mars. In proceſs of time they uſed different repreſentations of this *Jupiter*, &c. and conſidered them, vulgarly at leaſt, as ſo many different perſons. They afterward regarded each of them in different views: e. g. The *Jupiter*, that ſhowered down bleſſings, was called the *Kind Jupiter*; and when puniſhing, the *Terrible Jupiter*. There was alſo one *Jupiter* for Europe, and another for Africa; and in Europe, there was one great *Jupiter* who was the particular friend of the Athenians, and another who was the ſpecial protector of the Romans: nay, there was ſcarce a town or hamlet perhaps, in Italy, that had not a *Jupiter* of its own; and the *Jupiter* of Terracina or *Jupiter* Anxur, repreſented in medals as young and beardleſs, with rays round his head, more reſembled Apollo than the great *Jupiter* at the Capitol. In this way *Jupiter* at length had temples and different characters almoſt every where: at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great *Jupiter* was the Olympian *Jupiter*; and at Rome, the greateſt *Jupiter*, was the Capitoline *Jupiter*, who was the guardian and benefactor of the Romans, and whom they called the beſt and greateſt *Jupiter*; *Jupiter optimus maximus*. The figure of this *Jupiter* was repreſented in his chief temple on the Capitoline hill, as ſitting on a curule chair, with the fulmen or thunder, or rather lightning in one hand, and a ſceptre in the other. This fulmen in the figures of the old artiſts was always adapted to the character under which they were to repreſent *Jupiter*. If his appearance was to be mild and calm, they gave him the conic fulmen or bundle of ſtarres wreathed cloſe together, held down in his hand: When puniſhing, he holds up the ſame figure, with two tranſverſe darts of lightning, ſometimes with wings added to each ſide of it, to denote its ſwiftneſs: this was called by the poets, the three-forked bolt of Jove: and when he was going to do

ſome

ſome exemplary execution, they put in his hand a handful of flames, all let looſe in their utmoſt fury; and ſometimes filled both his hands with flames. The ſuperiority of *Jupiter* was principally manifeſted, in that air of majeſty which the ancient artiſts endeavoured to expreſs in his countenance: particular attention was paid to the head of hair, the eye-brows and the beard. There are ſeveral heads of the mild *Jupiter* on ancient ſeals: where his face has a mixture of dignity and eaſe in it, admirably deſcribed by Virgil, *Æn.* i. v. 256. The ſtatues of the Terrible *Jupiter* were generally of black marble, as thoſe of the former were of white: the one ſitting with an air of tranquillity; the other ſtanding, mere or leſs diſturbed. The face of the one is pacific and ſerene; of the other angry or clouded. On the heads of the one the hair is regular and compoſed; in the other, it is ſo diſcompoſed, that it falls half-way down the forehead. The face of the *Jupiter Tonans* reſembles that of the Terrible *Jupiter*; he is repreſented on gems and medals as holding up the triple bolt in his right hand, and ſtanding in a chariot, which ſeems to be whirled on impetuouſly by four horſes. Thus he is alſo deſcribed by the poets. Ovid Deian. Here. v. 28. Horace lib. i. od. 34. v. 8. *Jupiter*, as the intelligence preſiding over a ſingle planet, is repreſented only in a chariot and pair: on all other occaſions, is repreſented in a chariot, he is always drawn by four horſes. *Jupiter* is well known as the chief ruler of the air, whoſe particular province was to direct the rains, the thunders, and the lightnings. As the diſpenſer of rain, he was called *Jupiter Pluvius*; under which character he is exhibited ſeated in the clouds, holding up his right hand, or extending his arms almoſt in a ſtrait line each way, and pouring a ſtream of hail and rain from his right hand on the earth; whilſt the fulmen is held down in his left. The wings that are given to him relate to his character of preſiding over the air: his hair and beard in the Antonine pillar are all ſpread down by the rain, which deſcends in a ſheet from him, and falls for the refreſhment of the Romans; whilſt their enemies are repreſſented, as ſtruck with the lightnings and lying dead at their feet. Spence's Polymetis, p. 46, 182, and 210, &c.

JUPITER's *beard*, *barba Jovis*, the name given to a ſpecies of *anthyllis*. See LADY's *Finger*.

American JUPITER's *beard*, is a ſpecies of AMORPHA.

JUPITER's *Diſtaff*, is a ſpecies of *ſalvia* or SAGE.

JUPITER *Fulminans* and *Fulgurator*. See FULMINANT.

JUPITER, *Flamen of*. See FLAMEN and DIALIS.

JUPITER, ♃, in *Aſtronomy*, one of the ſuperior planets, remarkable for its brightneſs; and which, by its proper motion, ſeems to revolve round the earth in about twelve years. See PLANET.

Jupiter is ſituate between Saturn and Mars: it has a rotation round its own axis in 9 hours 56 minutes; and a periodical revolution round the ſun in 4332 days, 12 hours, 20′ 9″.

Jupiter is the biggeſt of all the planets: its diameter to that of the ſun appears, by aſtronomical obſervations, to be as 1056 is to 10000; to that of Saturn, as 1056 to 8761; to that of the earth, as 1056 to 89. For the comparative gravities at the ſurface, denſities, quantities of matter, &c. of the Sun, *Jupiter*, Saturn, and the Earth: See PLANETS. For the apparent diameter, ſee DIAMETER.

The mean diſtance of *Jupiter* from the ſun, is 5201 of thoſe parts whereof the mean diſtance of the earth from the ſun is 1000, though Kepler only makes it 5196 of thoſe parts. See DISTANCE.

M. Caſſini calculates *Jupiter's* mean diſtance from the earth to be 115,000 ſemidiameters of the earth.—Gregory computes the diſtance of *Jupiter* from the ſun to be above five times as great as that of the earth from the ſun; whence he gathers, that the diameter of the ſun, to an eye placed in *Jupiter*, would not be a fifth part of what it appears to us: and, therefore, his diſk would be twenty-five times leſs, and his light and heat in the ſame proportion. In reality, the ſun appears but $\frac{1}{27}$th ſo big to *Jupiter* as to us, and his light and heat are in the ſame ſmall proportion, but compenſated by the quick returns thereof, and by four moons revolving round him. The true diſtance by the lateſt obſervations is 494,990,976 miles. See PLANETS.

The inclination of *Jupiter's* orbit, that is, the angle, formed by the plane of its orbit, with the plane of the ecliptic, is 1 deg. 20 min. The place of his aphelion ☋, 9° 10′ and the place of his aſcending node ☊ 7° 29′. For the excentricity of *Jupiter's* orbit, ſee EXCENTRICITY.

Jupiter is one of the ſuperior planets, that is, of thoſe which are above the ſun: hence it has no parallax, its diſtance from the earth being too great to have any ſenſible proportion to the diameter of the earth. See PARALLAX.

Though it be the greateſt of the planets, yet its revolution about its axis is the ſwifteſt. Its polar axis is obſerved to be ſhorter than its equatorial diameter; and ſir Iſaac Newton determines the difference to be as 8 to 9. So that its figure is a ſpheroid; and the ſwiftneſs of its rotation occaſions the ſpheroidiſm to be more ſenſible than that of any other of the planets.

Jupiter appears almoſt as large as Venus; but he is not altogether ſo bright: he is eclipſed by the moon, by the ſun, and even by Mars.—Mars has ſaid to have once obſerved *Jupiter's* diameter ſeven inches, having inequalities like the moon.

Jupiter has three appendages, called *zones*, or *belts*, which ſir Iſaac Newton thinks are formed in his atmoſphere.—In theſe no ſpots, or ſpots from whoſe motion, the motion of *Jupiter* round its axis is ſaid to have been firſt determined, the diſcovery of which is controverted between Euſtachio, Fr. Gottignies, Caſſini, and Campani.

The four little ſtars, or moons, which move round *Jupiter*, were firſt diſcovered by Galileo, who called them the *aſtra Medicæa*, but we call them the *ſatellites* of *Jupiter*. For the periods, diſtances, &c. of theſe ſatellites, ſee SATELLITES.

Theſe four moons muſt make an extremely pleaſing ſpectacle to the inhabitants of *Jupiter*; for ſometimes they are altogether, ſometimes they are all together in the meridian, ranged one under another; and ſometimes all appear in the horizon. Add, that they frequently undergo ECLIPSES, the obſervations whereof are found of eſpecial uſe in determining the longitude. Caſſini has made tables for calculating their immerſions, and emerſions, of *Jupiter's* firſt ſatellite. See IMMERSION.

Comparative Aſtronomy of JUPITER.—The day and night are of the ſame length in *Jupiter* all over his ſurface, viz. five hours ten; the axis of his diurnal rotation being nearly at right angles to the plane of his annual orbit. And this is a great advantage and wiſely ordered by the Author of nature. For if the axis of this planet were inclined to any conſiderable number of degrees, juſt ſo many degrees round each pole would in their turn be almoſt ſix months in darkneſs. And, as even a degree of a great circle on *Jupiter* contains ſeven hundred and ſix of our miles, it is a mean rate, it is eaſy to judge what vaſt tracts of land would be rendered uninhabited by any conſiderable inclination of his axis. Though there be four primary planets below *Jupiter*, yet an eye placed on his ſurface would never perceive any of them; unleſs, perhaps, in ſpots paſſing over the ſun's diſk, when they happen to come between the eye and the ſun.—The parallax of the ſun, viewed from *Jupiter*, will ſcarce be diſcernible, no more than that of Saturn, neither being much above 20 ſeconds; ſo that the ſun's apparent diameter in *Jupiter* will not be above ſix minutes. The outermoſt of *Jupiter's* ſatellites will appear almoſt as big as the moon does to us; viz. five times the diameter, and 25 times the diſk of the ſun.—Dr. Gregory adds, that in all ſummer in *Jupiter* would eaſily diſtinguiſh two bands of planets, four nearer him; viz. the *ſatellites*; and two, the *ſun*, and *Saturn*; more remote. The moon, however, will fall vaſtly ſhort of the ſun in brightneſs, notwithſtanding the great diſproportion in the diſtances and apparent magnitude. From theſe four diſtant moons the inhabitants of *Jupiter* will have four different kinds of months; and the numbers of months in their year will not be leſs than 4500. Theſe moons are eclipſed as often as, being in oppoſition to the ſun, they fall within the ſhadow of *Jupiter*; and again, as often as, being in conjunction with the ſun, they project their ſhadows to *Jupiter*, they make an eclipſe of the ſun to an eye placed in that part of *Jupiter* where the ſhadow falls. But in regard the orbits of theſe ſatellites are in a plane which is inclined to, or makes an angle with *Jupiter's* orbit, their eclipſes become central, when the ſun is in one of the nodes of theſe ſatellites; and about out of this poſition, the eclipſes may be total, though not central, becauſe the breadth of *Jupiter's* ſhadow is nearly decuple to that of the breadth of any of the ſatellites; and the apparent diameter of any of theſe moons is nearly quintuple the apparent diameter of the ſun. It is owing to this remarkable diverſity of diameters, and the ſmall inclination the plane of the orbits of the ſatellites has to the plane of *Jupiter's* orbit, that in each revolution there happen eclipſes both of the ſatellites, and of the ſun; though the laſt be at a conſiderable diſtance from the nodes. Farther, the inferior among theſe ſatellites, even when the leaſt of its greateſt diſtance from the nodes, will ever be eaſily eclipſed and be eclipſed by the ſun to an inhabitant of *Jupiter*; though the remoteſt of them, in this caſe, eſcapes falling into *Jupiter's* ſhadow, and *Jupiter* into his, for two years together. To this it may be added, that one of theſe ſatellites ſometimes eclipſes

eclipses another; where the phasis must be different, may frequently oppofite to that of the fatellite falling into the fhadow of *Jupiter* juft mentioned; for in this the eaftern limb immerges firft, and the weftern emerges laft; but in the other it is juft the reverfe.

The fhadow of *Jupiter*, though it reaches far beyond its fatellites, yet falls much fhort of any other planet. Indeed, *Jupiter*'s fhadow could not reach Saturn, the next fuperior planet, unlefs *Jupiter*'s diameter were half that of the fun; whereas, in effect, it is not one ninth of it.

The courfes of *Jupiter*'s fatellites, and their various eclipfes, would render navigation very fure and eafy on the globe of *Jupiter*. Even we, at this diftance, can make very good ufe of them; thofe eclipfes being found one of our beft means for determining the LONGITUDE at fea.

JUPITER, among *Alchemifts*, fignifies the philofophers gold. The gentlemen of this profeffion apply every thing to their art, which the mythologifts mention of the god *Jupiter*, pretending that the ancient fables are to be underftood in a figurative fenfe: for inftance, *Jupiter* is the matter of the gods; and gold, fay they, is the moft precious of metals. Mercury is the ambaffador of *Jupiter*; and this fhews with how much eafe Mercury infinuates into every thing. *Jupiter* holds the thunderbolt as his fceptre; which evidently points out the external fulphur ufed in projection. *Jupiter* has the heavens for his ordinary habitation; this fhews him volatile, dry, and hot. The debauches of *Jupiter*, who fought for pleafure in the low, but prolific and fruitful earth, difcover, fay they, its fecundity, and that gold might be made, were but the way of preparing it difcovered. In a word, *Jupiter* is the fon of Saturn, which fhews fome refemblance between the qualities of gold and lead.

JUPITER, in *Chemiftry*, denotes TIN.

JUPUJUBA, the Brafilian name of a bird of the woodpecker kind, more commonly known by the name JAPU.

JUQUER. This plant is found in Brafil, and is of a poifonous nature; but if we may credit Pifo, its root is its antidote.

JURATAM—*Affifa coacta in juratam*. See ASSISA.

JURATI. See JURATS.

JURATIS, *Non ponendis in*. See NON *ponendis*.

JURATORES, *Teftimonii*. See DISTRINGAS.

JURATS, JURATI, magiftrates in the nature of ALDERMEN, for the government of feveral corporations.

Thus we meet with the mayor and *jurats* of Maidftone, Rye, Winchelfea, &c.—So alfo Jerfey has a bailiff and twelve *jurati*, or fworn aflaftants, to govern the ifland.

JURE.—*De* JURE. See *De Facto* and POSSESSION.

JURE, *Quo*. See QUO *Jure*.

JURIDICI *dies*. See DIES.

JURIS UTRUM, in *Law*, a writ called the parfon's writ of right, which lies for the parfon of a church, or prebendary, at common law, and for a vicar by ftat. Ed. III. c. 17. whofe predeceffor hath alienated the lands and tenements thereof, by which they may recover lands and tenements belonging to the church, or of which they were diffeifed; or which were recovered againft them by verdict, confeffion, or default, without praying in aid of the patron and ordinary; or on which any perfon has intruded fince the predeceffor's death. But fince the reftraining ftatute of 13 Eliz. c. 10. whereby the alienation of the predeceffor, or a recovery fuffered by him of the lands of the church, is declared to be abfolutely void, this remedy is of little ufe, unlefs where the parfon himfelf has been defeated for more than twenty years; for the fucceffor, at any competent time after his acceffion to the benefice, may enter, or bring an ejectment.

JURISCONSULTUS, or JURECONSULTUS, ICTUS, among the Romans, was a perfon learned in the law; a matter of the Roman jurifprudence; who was conulted on the interpretation of the laws, and cuftoms, and the difficult points in law-fuits.

The fifteen books of the DIGEST were compiled wholly from the anfwers, or reports, of the ancient *jurifconfults*. Tribonianus, in deftroying the two thoufand volumes from whence the CODE and DIGEST were taken, has deprived the public of many things, which would have given them light into the office of the ancient *jurifconfults*.

We fhould fcarce have known any thing beyond their bare names, had not Pomponius, who lived in the fecond century, taken care to preferve fome circumftances of their office.

The Roman *jurifconfults* feem to have been the fame with our chamber-counfellors, who arrived at the honour of being conulted, through age and experience, but never pleaded at the bar. Their pleading advocates or lawyers, never became *jurifconfults*.

In the times of the commonwealth, the *advocati* had by much the more honourable employment, as being in the ready way to attain to the higheft preferments. They then defpifed the *jurifconfulti*, calling them in derifion *formularii* and *bajulos*, as having invented certain forms, and monofyllables, in order to give their anfwers the greater appearance of gravity and myftery. But in procefs of time they became fo much eftcemed, that they were called *prudentes* and *fapientes*, and the emperors appointed the judges to follow their advice. Auguftus at length advanced them to be public officers of the empire; fo that they were no longer confined to the petty counfels of private perfons.

Bern. Rutilius has written the lives of the moft famous *jurifconfulti*, who have lived within thefe two thoufand years.

JURISDICTION, a power, or authority, which a man has to do juftice in cafes of complaint made before him. There are two kinds of *jurifdiction*; the one *eccleſiaſtical*, the other *ſecular*.

JURISDICTION, *Secular*, belongs to the king, and his juftices, or delegates.

The courts and judges at Weftminfter have *jurifdiction* all over England, and are not reftrained to any county or place; but all other courts are confined to their particular *jurifdictions*, which if they exceed, whatever they do is erroneous. There are three forts of inferior *jurifdictions*: the firft is *tenere placita*, to hold pleas, and the plaintiff may fue either there or in the king's courts. Another is the conufance of pleas, where a right is inveſted in the lord of the franchife to hold pleas: and he is the only perfon that can take advantage of it, by claiming his franchife. The third fort is an exempt *jurifdiction*, as where the king grants to fome city, that the inhabitants fhall be fued within their city, and not elfe where; though there is no *jurifdiction* that can withftand a *certiorari* to the fuperior courts. See JUSTICE, and COURT.

Eccleſiaſtical JURISDICTION belongs to bifhops and their deputies. See BISHOP, and OFFICIAL.

Bifhops, &c. have two kinds of *jurifdiction*: the one *internal*, which is exercifed over the conficience in things purely fpiritual; and this they are fuppofed to hold immediately of God.

The other is *conventious*, which is a privilege fome princes have given them in terminating difputes between eccleſiaſtics and laymen. See CONVENTIOUS.

JURISPRUDENCE, the fcience of what is juft and unjuft, or of the laws, rights, cuftoms, ftatutes, &c. neceffary for the doing of juftice.

Civil jurifprudence is that of the Roman law; *canonical*, that of the canon law; and *feudal*, that of fees.

JUROR, JURATOR, in a *Legal Senſe*, is one of thofe twenty-four, or twelve men, who are fworn to deliver truth upon fuch evidence as fhall be given them touching any matter in queftion.

The punifhment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very fevere. See ATTAINT.

JURORS, *Challenge to the*. See CHALLENGE.

JURUCUA, in *Zoology*, the Brafilian name of a fpecies of tortoife. This has feet almoft in the fhape of wings, the fore ones about fix inches long, the hinder ones confiderably fhorter; its tail is fhort, and of a conic figure; its eyes large and black; its mouth has no teeth, but refembles the beak of a bird. It frequently grows to four feet long, and about three in width; its ribs are faftened to the fhell, and are eight on each fide; the middle ones of thefe are the longeft, the fore and hinder ones being the fhorter. The flefh and eggs of this fpecies are very delicately tafted; they lay their eggs in holes on the fea-fhore, covering them over with fand, and leaving them for the fun to hatch them. There are ufually a great many very odd figures, like geometrical lines, running in various directions on the fhell; the whole ground of the fhell is ufually black and very gloffy, adorned with yellow variegations; but this is no certain character of the fpecies, the varieties in the colouring of thefe fhells being very great.

JURUNCAPEBA, in *Ichthyology*, the name of a fea-fifh, of the turdus or wraffe kind, caught about the fhores of the Brafils, and called alfo *itaiara*. It is ufually about five or fix inches long, and about a third part of its length in breadth; its mouth is extremely large and wide, and of a fomewhat triangular figure.

It is caught among the rocks, and is a very delicate fifh for the table.

JURUBA, in *Zoology*, the name of a fpecies of tortoife, common in the Brafils. It is a fmall kind, feldom exceeding ten fingers in breadth, and eight or nine in length, and is of an elliptic figure; its under fhell is about nine fingers long, and four and a half broad, and is flat; it can at pleafure hide its whole body in the fhell, or thruft out its neck to three fingers breadth diftance; the head is thick and long, the nofe elevated and pointed; the mouth is large, and the eyes black; it

has four long claws on its feet; its tail is short and pointed; and its skin is rough and scaly. The upper shell is brown, the lower yellow; its eggs are white and round, and about half the size of a hen's egg, and are very well tasted.

JURY, in *Common Law*, signifies twenty-four, or twelve men, sworn to inquire of a matter of fact, and declare the truth, upon such evidence as shall be delivered them touching the matter in question.

The mode of trial by *jury* is very ancient, and seems to have been coeval with the civil government of this nation. Traces of *juries* may be found in the laws of all those nations, which adopted the feudal system, as in Germany, France, and Italy; and in England we find actual mention of them so early as the laws of king Ethelred, and even then not as a new invention. The establishment and use of this mode of trial in our island, though for a time greatly impaired and shaken by the introduction of the Norman trial by battle, were so highly esteemed and valued by the people, that no conquest, no change of government, could ever prevail to abolish it. See JUDICIUM *parium*.

Trials by *jury* in civil causes are of two kinds; extraordinary and ordinary. The first species of extraordinary trial by *jury* is that of the grand assize. See ASSIZES.

Another species of extraordinary *juries*, is the *jury* to try an ATTAINT.

With regard to the ordinary trial by *jury* in civil cases, when an issue is joined, the court awards a writ of VENIRE *facias*, which is accordingly issued to the sheriff. Thus the cause stands for a trial at the bar of the court itself, provided it be of consequence; but all trifling suits are ended in the court baron, hundred, or county courts. However, when the usage began to bring actions of any trifling value in the courts of Westminster-hall, it was found very inconvenient to compel the parties, witnesses, and jurors, to come from the remotest parts of the country to try a trivial action at Westminster; and, therefore, the legislature referred matters in issue to the JUSTICES *of assize*. Accordingly it was enacted by 13 Edw. I. cap. 30. that a clause of NISI *prius* should be inserted in all the writs of *venire facias*, by virtue of which the sheriff returned his jurors to the court of the justices of assize, which was sure to be held in the vacation before Easter and Michaelmas terms, and there the trial was held. But this method was inconvenient, and, therefore, was altered by 42 Edw. III. cap. 11. which statute enacted, that no inquest, except of assise and gool delivery, should be taken by writ of *nisi prius*, till after the sheriff had returned the names of the jurors to the courts above. It is now the course to make the sheriff's *venire* returnable on the last return of the same term, wherein issue is joined, viz. Hilary or Trinity terms, which are called issuable terms; and he returns the names of the jurors in a panel, i. e. little pane, or oblong piece of parchment, annexed to the writ. This *jury* is not summoned, and, therefore, not appearing at the day, must unavoidably make default: for which reason a compulsive process is now awarded against the jurors, called in the common pleas a writ of *habeas corpora juratorum*, and in the king's bench a DISTRINGAS. The entry, therefore, on the roll or record is, that the *jury* is respited, through defect of the jurors, till the first day of the next term, then to appear at Westminster; unless before that time, viz. on Wednesday the fourth of March, the justices of our lord the king appointed to take assizes in that county shall have come to the place assigned for holding the assises, &c. And as the judges are sure to come and open the circuit commissions on the day mentioned in the writ, the sheriff returns and summons this *jury* to appear at the assises, and there the trial is had before the justices of assize and *nisi prius*; among whom are usually two of the judges of the courts at Westminster, the whole kingdom being divided into six CIRCUITS for this purpose. If the SHERIFF be not an indifferent person, or if he be a party in the suit, or be related either by blood or affinity to either of the parties, the *venire* shall be directed, not to him, but to the CORONERS; and if any exception lies against them, to two clerks of the court, or to two persons named by the court and sworn, and called *elisors*, or electors, who shall indifferently name the *jury*, and their return is final. In order farther to remove all suspicion of partiality, it is provided by the statutes 4 Edw. III. cap. 2. 8 Ric. II. cap. 2. and 33 Hen. VIII. cap. 24. that no judge of assise should hold pleas in any county where he was born or inhabits.

When the general day of trials is fixed, the plaintiff, or his attorney, must bring down the record to the assizes, and enter it with the proper officer, in order to its being called in course. If it be not so entered, it cannot be tried; therefore it is in the plaintiff's breast to delay any trial by not carrying down the record, unless the defendant undertakes to bring on the trial by giving proper notice to the plaintiff. This proceeding is called the trial by PROVISO. However, this practice begins to be disused, since the statute 14 Geo. II. cap. 17. which enacts, that if, after issue joined, the cause is not carried down to be tried according to the course of the court, the plaintiff shall be esteemed to be non-suited, and judgment shall be given as in a case of non-suit. In case the plaintiff intends to try the cause, he is bound to give the defendant (if he lives within forty miles of London) eight days notice of trial; and if he lives at a greater distance, fourteen days notice; and if he changes his mind, and does not countermand the notice five days before the trial, he shall be liable to pay costs to the defendant for not proceeding to trial, by the last mentioned statute. The defendant, however, or plaintiff, may, upon good cause shewn to the court above, as upon absence or sickness of a material witness, obtain leave upon motion to defer the trial of the cause till the next assizes. But when the cause is called on regularly in court, the record is conveyed to the judge, while the *jury* is called and sworn. To this end the sheriff returns the compulsive process, the writ of *habeas corpora*, or *nisi prius*, with the panel of jurors annexed, to the judge's clerk in court. The jurors contained in the panel are either special or common jurors. See *Special Jury*.

A common *jury* is one returned by the sheriff, according to the directions of the statute 3 & 4 Ann. cap. 25. which appoints, that the sheriff shall not return a separate panel for every separate cause, as formerly; but one and the same panel for every cause to be tried at the same assizes, containing not less than forty nor more than seventy-two jurors; and that their names, being written on tickets, shall be put into a box or glass; and when each cause is called, twelve of those persons, whose names shall be first drawn out of the box, shall be sworn upon the *jury*, unless absent, challenged, or excused; and unless a previous view of the lands in question, or other matters in question, shall have been thought necessary by the court; in which case six or more of the jurors returned, to be agreed on by the parties, or named by a judge, or other proper officer of the court, shall be appointed to take such a view; and then such of the *jury* as have appeared upon the view, shall be sworn on the inquest, previous to any other jurors.

List of jurors qualified according to the acts 4 & 5 W. & M. cap. 24. 7 & 8 W. III. cap. 32. and 3 & 4 Ann. cap. 18. are now to be made from the rates of each parish. The justices at Michaelmas sessions are to issue warrants to the high constables, who require the petty constables to prepare such lists; and if the high constables neglect to issue their precepts for this purpose, they shall forfeit 10*l*. These lists are to be fixed on the doors of churches, &c. twenty days before Michaelmas, that public notice may be given of persons omitted who are qualified, and of persons inserted, who ought to be omitted. 3 Geo. II. cap. 25. All such persons are inserted wrongfully, or omitted by the fault or reward, &c. the petty constable incurs a forfeiture of 5*l*. The lists shall be delivered by the petty constables, at Michaelmas sessions, in open court; or when they are subscribed by them, and attested on oath, and also signed by the justice, they shall be delivered to the petty constables to the high constables, who shall deliver them, upon oath, in open court. The constable failing to make such return, shall forfeit 5*l*. Persons not qualified may be discharged by the justices at the sessions. Their lists shall be then fairly entered in a book by the clerk of the peace, on forfeiture of 20*l*. and duplicates of them shall, during the sessions, or within ten days after, be delivered by him to the sheriff, who shall cause the names, with their additions, &c. to be entered in a book of his own; and if the sheriff shall return any person whose name is not in the duplicates, he is liable to a fine not exceeding 10*l*. nor less than 40*s*. 3 Geo. II. cap. 25. Every summons of jurors shall be made by the sheriff, his officer, or lawful deputy, six days before the sessions at least, in Wales eight days before, and in the counties palatine fourteen days before; and the penalty of neglect, or of excusing any person for favour or reward, is 50*l*. by 7 & 8 W. cap. 32. or a fine of 50*l*. or under, imposed by the judge of assize. 3 Geo. II. cap. 25. No person shall be summoned, who has served within one year before in the county of Rutland, or two years before in any other county, not being a county of a city or town, and except the counties of York and Middlesex, under a fine not exceeding 5*l*. Every person who has served, shall have a certificate gratis, testifying his attendance. 3 Geo. II. cap. 25. In the county of York, twenty shall not be returned above once in four years; and the sheriff neglecting his duty shall forfeit 100*l*. and be not discharging a juror,

juror, who has ſerved within four years, and giving notice to the party ſummoned ſix days before the aſſizes or ſeſſion, ſhall forfeit 20*l.* to the party with full coſts. 7 & 8 W. cap. 32. 3 & 4 Ann. cap. 18. & 10 Ann. cap. 14. In the county of Middleſex, no perſon ſhall be returnable to ſerve as a juror, at any ſeſſions of *niſi prius*, who hath been returned in the two terms or vacations next before, on pain of the ſheriff being fined by the judges 45*l.* or under. 4 Geo. II. cap. 7. And by 7 & 8 W. cap. 32. the inhabitants of the city and liberty of Weſtminſter ſhall be exempted from ſerving on any *jury* at the ſeſſions for Middleſex, by reaſon of their attendance at the courts of Weſtminſter. By the common law, jurors returned, and not appearing, ſhall loſe and forfeit the iſſues returned upon them. And if a juryman be called, and, being preſent, refuſe to appear; or having appeared, withdraw before he be ſworn, the court may fine him at their diſcretion. 35 Hen. VIII. cap. 6. And by 29 Geo. II. cap. 19. a juror not appearing and ſerving in any court of record within the city of London, or in any other city or town corporate, liberty, or franchiſe, after being openly called three times, &c. ſhall, without reaſonable excuſe, be fined not more than 40*s.* nor leſs than 20*s.* And by 3 Geo. II. cap. 25. in cauſes of *niſi prius*, every perſon whoſe name ſhall be drawn, and who ſhall not appear, without reaſonable excuſe, ſhall forfeit, not exceeding 5*l.* nor leſs than 40*s.* If a juror take a bribe of either party, he ſhall forfeit ten times as much as he hath taken. 3 Ed. III. cap. 10. 34 Ed. III. cap. 8. 38 Ed. III. ſtat. 1. cap. 12. If a man aſſault or threaten a juror for giving a verdict againſt him, he is puniſhable by fine or impriſonment; and if he ſtrike him in the court, in the preſence of a judge of aſſize, he ſhall loſe his hand and his goods, and profits of his lands during life, and ſuffer perpetual impriſonment.

The *jury* is to be choſen of the ſame claſs or rank with the parties, and, by the policy of the ancient law, the *jury* was to come *de vicinetu*, from the neighbourhood of the village or place where the cauſe of action was laid in the declaration, and for want of this, the array might be challenged for defect of hundredors. However, this practice was entirely abolithed by 4 & 5 Ann. cap. 16. upon all civil actions, except upon penal ſtatutes; and upon thoſe alſo by the 24 Geo. II. cap. 18. the *jury* being now only to come, *de corpore comitatus*, from the body of the county at large, and not *de vicinetu*, or from the particular neighbourhood. It is alſo enacted by 28 Edw. III. cap. 18. that where either party is an alien born, the *jury* ſhall be one half aliens, and the other denizens, if required, for the more impartial trial. But where both parties are aliens, the whole *jury* are directed to be denizens, by 21 Hen. VI. cap. 4. For other grounds of challenge and qualification of jurors, ſee CHALLENGE. Jurors in London and Weſtminſter muſt not only be houſekeepers, but have land or goods worth one hundred pounds; and they may be examined on oath as to that point. 3 Geo. II. cap. 25. All cities, boroughs, and corporate towns, are excepted out of the act that ſettles the qualification of jurors for county aſſizes or ſeſſions; and trials of felons in corporations may be by men worth 40*l.* in goods, though they have no freehold. Jurors in the city ſhall have 20*l.* a year freehold, or 26*l.* 8*d.* copyhold. Any perſon whatſoever is capable of being put upon the *jury* in a court-leet, and upon the coroner's *jury*. Perſons excuſed from ſerving on *juries* are thoſe that are ſick and decrepit; thoſe not commorant in the county, and men above ſeventy years old, by 13 Edw. I. cap. 38. and by 7 & 8 Will. III. cap. 32. infants under twenty-one. This exemption is alſo extended by divers ſtatutes, cuſtoms, and charters, to phyſicians, and other medical perſons, counſel, attornies, officers of the courts, and the like, all of whom, if impanelled, muſt ſhew their ſpecial exemptions. Diſſenting teachers, qualified under the toleration act, are exempted, and alſo quakers. Clergymen are alſo uſually excuſed; but if they are ſeiſed of lands and tenements, they are ſtrictly liable to be impanelled in reſpect of their lay fees, unleſs they be in the ſervice of the king, or of ſome biſhop. If by means of challenges, or other cauſe, a ſufficient number of unexceptionable jurors doth not appear at the trial, either party may pray a TALES. When the legal number of twelve is obtained, they are then ſeparately ſworn, well and truly to try the iſſue between the parties, and a true verdict to give, according to the evidence; and hence they are denominated the *jury*, *jurata*, and jurors, *ſc. juratores*. Pleadings are then opened to them by counſel on that ſide which holds the affirmative of the queſtion in iſſue; the nature of the cauſe, and the evidence intended to be produced, are next laid before them by counſel alſo on the ſame ſide; and when their evidence is gone through, the advocate on the other ſide opens the adverſe caſe, and ſupports it by evidence; and then the party which began is heard by way of reply. See EVIDENCE.

As to ſuch evidence as the *jury* may have in their own conſciences, by their private knowledge of facts, it was an ancient doctrine, that this had as much right to ſway their judgment as the written or parole evidence which is delivered in court; and, therefore, it hath been often held, that though no proofs be produced on either ſide, yet the *jury* might bring in a verdict. But this doctrine was gradually exploded, when ATTAINTS began to be diſuſed, and new trials introduced in their ſtead. And if a juror knows any thing of the matter in iſſue, he may be ſworn as a witneſs, and give his evidence publicly in court. When the evidence on both ſides is gone through, the judge in the preſence of the parties, the counſel, and all others, ſums up the whole to the *jury*, who, unleſs the caſe be very clear, withdraw from the bar to conſider of their verdict; and, in order to avoid intemperance and cauſeleſs delay, they are to be kept without meat, drink, fire, or candle, unleſs by permiſſion of the judge, till they are all unanimouſly agreed. And if they eat or drink, or have any eatables about them, without conſent of the court, and before verdict, it is fineable; and if they do ſo at his charge for whom they afterwards find, it will ſet aſide the verdict. Alſo, if they ſpeak with either of the parties or their agents, after they are gone from the bar, or if they receive any freſh evidence in private, or, if to prevent diſputes, they caſt lots for whom they ſhall find, any of theſe circumſtances will entirely vitiate the verdict. And it has been held, that if the jurors do not agree in their verdict before the judges are about to leave the town, though they are not to be threatened or impriſoned, the judges are not bound to wait for them, but may carry them round the circuit from town to town in a cart. When they are all unanimouſly agreed, the *jury* return back to the bar; and before they deliver their verdict, the plaintiff is bound to appear in court, by himſelf, attorney, or counſel, in order to anſwer the AMERCEMENT, to which by the old law he is liable, in caſe he fails in his ſuit, as a puniſhment for his falſe claim; a form which is ſtill continued, though the amercement is diſuſed; and if the plaintiff does not appear, no verdict can be given, but the plaintiff is ſaid to be NON-*ſuit*. But in caſe the plaintiff appears, the *jury* by their foreman deliver in their VERDICT. When the *jury* have delivered in their verdict, and it is recorded in court, they are then diſcharged. Such is the proceſs of trial by *jury* in civil cauſes.

In criminal caſes, it is provided by the equity and lenity of the Engliſh laws, that no man ſhould be called to anſwer for any capital crime, unleſs upon the preparatory accuſation of twelve or more of his fellow-ſubjects, called the *grand jury*. This *jury* conſiders all bills of INDICTMENT againſt criminals preferred to the court, which they either approve or find, by writing upon them BILLA *vera*, or diſallow, by indorſing IGNORAMUS, and generally conſiſts of gentlemen that are freeholders of ſuperior quality to thoſe who form the *petit jury*, who *try* the priſoners indicted by the other *jury*, and convict them by verdict.

When a priſoner is on his arraignment, has pleaded not guilty, and for his trial hath put himſelf upon the country, which country the *jury* are, the ſheriff of the county muſt return a panel of jurors that are freeholders, without juſt exception, and of the *viſne*, or neighbourhood, i. e. of the county where the fact is committed. If the proceedings are before the court of king's bench, there is a time allowed, between the arraignment and the trial, for a *jury* to be impanelled by a writ of VENIRE *facias* to the ſheriff, as in civil cauſes; and the trial in caſe of a miſdemeanor is had at NISI *prius*, unleſs it be of ſuch conſequence as to merit a trial at bar; which is always invariably had, when the priſoner is tried for any capital offence. But, before commiſſioners of *oyer & terminer*, and gaol delivery, the ſheriff, by virtue of a general precept, directed to him beforehand, returns to the court a panel of forty-eight jurors, to try all felons that may be called upon their trial at that ſeſſion; and, therefore, it is uſual to try all felons immediately, or ſoon after their arraignment. But perſons indicted of ſmaller miſdemeanours, uſually give ſecurity to the court to appear, for trial at the next aſſizes or ſeſſion. See INDICTMENT.

When the trial is called on, the jurors are to be ſworn, as they appear to the number of twelve, unleſs they are challenged by the party. See CHALLENGE, *& ſupra*. TALES may be awarded as in civil cauſes, till the number of twelve is ſworn, "well and truly to try, and true deliverance make, between our ſovereign lord the king, "and the priſoner whom they have in charge; and a "true verdict to give, according to their evidence." When the *jury* is ſworn, if it be a cauſe of any conſequence, the indictment is uſually opened, and the evi-

dence

thence stated by the counsel for the crown or prosecution. But it is a settled rule at common law (inconsistent, indeed, with the humane treatment of prisoners by the English law, but published by the declaration of law, that the judge shall be counsel for the prisoner, i. e. shall see that the proceedings against him are legal and strictly regular) that no counsel shall be allowed a prisoner upon his trial, upon the general issue in any capital crime, unless some point of law should arise proper to be debated. However, the judges seldom scruple to allow a prisoner counsel to stand by him at the bar, and instruct him what questions to ask, or even to ask questions for him, with respect to matters of fact; for as to matters of law, arising on the trial, they are entitled to the assistance of counsel. When the EVIDENCE on both sides is closed, the *jury* cannot be discharged till they have given in their verdict; but are to consider of it and deliver it in, with the same forms as upon civil causes; only that they cannot, in a criminal case, give a *privy* VERDICT. But an open verdict may be either general, guilty or not guilty; or special, setting forth all the circumstances of the case, and praying the judgment of the court, whether, for instance, on the facts stated, it be murder, manslaughter, or no crime at all. If the *jury* find the prisoner not guilty, he is then for ever discharged of the accusation, except he be appealed of felony within the time limited by law. But if they find him guilty, he is said to be convicted of the crime whereof he stands indicted. On a conviction for any felony, in general, the reasonable expences of prosecution are by stat. 25 Geo. II. cap. 36. to be allowed to the prosecutor out of the county stock, if he petitions the judge for that purpose; and by 27 Geo. II. cap. 3. poor persons bound over to give evidence, are likewise entitled to be paid their charges, as well without conviction as with it. Moreover, on a conviction of larceny in particular, the prosecutor shall have restitution of his goods, by 21 Hen. VIII. cap. 11. which enacts, that if any person be convicted of larceny by the evidence of the party robbed, he shall have full restitution of his money, goods, and chattels; or the value of them out of the offenders goods, if he has any, by a writ to be granted by the justices; and this writ shall reach the stolen goods, though the property of them is transferred to another by sale in open market. Without such writ of restitution, the party may peaceably retake his goods wheresoever he finds them. And if the felon be convicted and pardoned, or allowed his clergy, the party robbed may bring his action of trover against him for his goods, and receive a satisfaction in damages. Such are the proceedings and consequences of a trial by *jury* in criminal cases. See Blackft. Comm. book iii. p. 349, &c. book iv. p. 372, &c.

JURY, *special*. Where it is conceived that an indifferent impartial *jury* will not be returned between party and party by the sheriff, the court upon motion will order the sheriff to attend the secondary of the king's bench, with his book of freeholders of the county; and the secondary, in the presence of the attornies on both sides, is to strike a *jury*. And when a cause of consequence is to be tried at the bar, the court of king's bench, on motion and affidavit made, will make a rule for the secondary to name forty-eight freeholders; and each party is to strike out twelve, one at a time, the plaintiff or his attorney beginning first; and from the remainder the *jury* for the trial are to be drawn. This is called a *special jury*.

By the stat. 3 Geo. II. cap. 25. either party is entitled upon motion to have a *special jury* struck upon the trial of any issue, as well at the assizes as at bar; he paying the extraordinary expence, unless the judge's writ certify, in pursuance of the stat. 24 Geo. II. cap. 18. that the cause required such *special jury*. And no person serving on a *special jury* shall be allowed more than the sum which the judge shall think reasonable, not exceeding one guinea, except in cases where a view is directed. When any *special jury* shall be ordered by rule of the court at Westminster, in any cause arising in any city, &c. the jury is to be taken out of lists, or books of persons qualified, which shall be produced by the sheriffs, &c. before the proper officer. The same indulgence is granted both to merchants and foreigners; for where two merchants are plaintiff and defendant, a jury of merchants may be returned to try the issue between them; and if either of the parties in the suit be an alien, the *jury*, at the desire of the party, is to be composed of half foreigners and half English.

JURIES, *clerk of the*. See CLERK.

JURY *of matrons*. MATRONS.

JURY-MAST, an appellation given by the seamen to a temporary or occasional mast, patched up of yards, or other pieces of timber, and set up in the room of a true mast, which has been lost in a fight, or by a storm.

JUS, and JURA. See LAW, RIGHT, &c.

Jus accrescendi, in *Law*, is the right of survivorship between joint-tenants.

Jus ad rem, is an inchoate and imperfect right, such as a person promoted to a living acquires by nomination and institution; in contradistinction to the *jus in re*, or complete and full right, by corporal possession.

Jus Anglorum, denotes the law and customs of the West Saxons, in the time of the heptarchy, by which the people were for a long time governed, and which were preferred before all others.

Jus coronæ, rights of the crown, is part of the law of England, which differs in many things from the general law concerning the subject. See CROWN LAW.

The king may purchase lands to him and his heirs, but he is seised thereof, *in jure coronæ*, and all the lands and possessions, whereof the king is thus seised, shall follow the crown in descents, &c. See PRE-EMPTION.

Jus curialitatis Angliæ. See COURTESY.

Jus dispositionis. See RIGHT.

Jus fiduciarium, in the *Roman law*, a right in trust for which there was a remedy in equity.

Jus gentium, is the law by which kingdoms and society in general, are governed.

Jus gladii is mentioned in our ancient authors, and the Norman laws, where it signifies a temporal jurisdiction. Camd. And hence it is, that the creation of an earl, he is said to be *gladio præcinctus*; to signify that he had a jurisdiction over the county for which he was made earl. See PLEAS *of the Sword*.

Jus legitimum, in the *Roman law*, a legal right which was remedied by the ordinary proceedings.

Jus patronatus, is a commission granted by the bishop to some persons to enquire who has the right of patronage of a church. If two patrons present, and contend, the bishop shall determine who shall have the right of patronage, &c. on commission to him by clergymen and six laymen, living near the church, who are to enquire on articles as a jury. Who presented last? Whether the church is void? who presented last? whether the patron? &c. But if copartceners several patrons present, the bishop is not obliged to admit any of them, because they present under one title. See the case, where two patrons presented two several times. The awarding a *jus patronatus* is discretionary, at the pleasure of the ordinary, for any person or information who hath the right of patronage may present within six months; at his peril take notice of the right, how to admit the clerk of either of the patrons, without a *jus*.

Jus præsentandi, in the *Roman law*, a right to present, for which the remedy was only by petition.

Jus, quasi. See QUASI *jus*.

JUS *togæ*. See TOGA.

JUSQUIAMUS, in *Botany*, a name by which the English authors call the hyoscyamus, or henbane.

JUSSIÆA, in *Botany*, a genus of the *decagynia* class. Its characters are these: it has a small permanent empalement, divided into five segments, fixing upon the germen; the flower has five petals, and ten short slender stamina; the germen becomes a thick, oblong capsule, crowned with the empalement, which opens lengthways, and is filled with small seeds. There are five species.

JUSSIEVIA, in *Botany*, a name given by Houstoun to a genus of plants, described by Linnæus under the name of JATROPHA.

JUST, a sportive kind of combat on horseback, man against man, armed with lances.

The word is by some derived from the French *jouster*, of the Latin *juxta*, because the combatants touch near one another. Salmasius derives it from the Greek ζευκτὸς, or rather ζεῦγος, which is used in the same sense by Suidas, Nicephorus Gregoras, &c. Others from the Greek ἰοῦστα; which in the corrupt age of the Greek empire was used for this exercise, because it was a more *just* and equal combat than the tournament.

Anciently, *juste* and tournament made a part of the entertainment at all solemn feasts and rejoicings. The Spaniards borrowed these exercises from the Moors, and called them *juego de canna*, from the *cane* or lance. Some take them to be the same with the *equi trojani*, anciently practised by the youth of Rome.

The Turks use them still, and call them *larnier the reid*.

The difference between *juste* and tournament consists in this, that the latter is a species of which the former is only a species: tournament included all kinds of military sports and engagements, while *juste* was out of gallantry and diversion. *Juste* was particular combats where the parties rode against each other, and engaged with lance and sword; and that the punishment was frequently performed by a number of cavaliers, who fought in a body; the *juste* was a single combat of one man

man againſt another. Though *the juſts* were uſually made in tournaments, after a general rencounter of all the cavaliers, yet they were ſometimes ſingly, and independent of any tournament.

He who appeared firſt at the firſt time at a *juſt*, forfeited his helm, or caſque, unleſs he had forfeited before at a tournament.

JUST *appui*. See APPUI.

JUSTICE, *Juſtitia*, a conſtant deſire, or inclination, to give every one his due; or a habit by which the mind is diſpoſed and determined to give every man his own.

Juſtice may be diviſded into *diſtributive*, *commutative*, and *legal*.

JUSTICE, *diſtributive*, is concerned in matters of government, and of beneficence; and is either remuneratory, or punitive: it obſerves an equality in dealing rewards and puniſhments, according to each man's condition and merit; for as actions are either good or evil, for the good, rewards muſt be aſſigned; and for the evil, puniſhments; and herein a geometrical proportion is obſerved.

JUSTICE, *commutative*, is converſant in matters of commerce, and in the equal commutation, or changing, of things; and proceeds according to arithmetical equality, without any regard to perſons and circumſtances.

JUSTICE, *legal*, is that which reſides in the ſtate, or monarch, by whoſe power and authority the effects of *commutative* and *diſtributive juſtice* are frequently ſuperſeded, or ſuſpended; as in a dearth of corn, if a perſon that has a ſtock by him will not ſell it, it ſhall be taken from him; and the like.

JUSTICE, *hand of*. See HAND.

JUSTICE, *officers of*. See OFFICERS.

JUSTICE, *poetical*. See POETICAL.

JUSTITIAM, *temperamentum ad*. See TEMPERAMENTUM.

JUSTICE, *Juſtitiarius*, is likewiſe an officer appointed by the king or commonwealth, to do right by way of judgment.

He is called *juſtice*, not *judge*; anciently *juſtitia*, not *juſtitiarius*, becauſe he has his authority by deputation, as delegate to the king, and not *jure magiſtratus*; ſo that he cannot depute any other in his ſtead, the *juſtice* of the foreſt only excepted.

Of theſe *juſtices* we have various kinds in England; viz.

Chief JUSTICE *of the king's bench*, is the capital *juſtice* of Great Britain, and is a lord by his office. His buſineſs is chiefly to hear and determine all pleas of the crown; that is, ſuch as concern offences againſt the crown, dignity, and peace of the king; as treaſons, felonies, &c.

This officer was formerly not only *chief juſtice*, but alſo chief baron for the exchequer, and maſter of the court of wards. He uſually ſat in the king's palace, and there executed that office, formerly performed *per eundem palatii*; he determined in that place all the differences happening between the barons and other great men.

He had the prerogative of being vicegerent of the kingdom, whenever the king went beyond ſea, and was uſually choſen to that office out of the prime nobility; but his power was reduced by king Richard I. and king Edward I. His office is now divided, and his title changed from *capitalis juſticiarius*, to *capitalis juſticiarius ad placita, coram rege tenenda*, or *capitalis juſticiarius banci regis*. See COURT *of king's bench*.

Chief JUSTICE *of the common pleas*, he who, with his aſſiſtants, hears and determines all cauſes at the common law; that is to ſay, all civil cauſes, between common perſons, as well perſonal as real; and he is alſo a lord by his office.

JUSTICE *of the foreſt*, is a lord by his office, who has power and authority to determine offences committed in the king's foreſts, &c. which are not to be determined by any other court, or *juſtice*.

Of theſe there are two, whereof one has juriſdiction over all the foreſts on this ſide Trent, and the other beyond it.

By many ancient records, it appears to be a place of great honour and authority, and is never beſtowed but on ſome perſon of great diſtinction. The court where this *juſtice* ſits, is called the *juſtice ſeat of the foreſt*, held once every three years, for hearing and determining all treſpaſſes within the foreſt, and all claims of franchiſes, liberties, and privileges, and all pleas of cauſes whatſoever therein ariſing. This court may fine and impriſon for offences within the foreſt, it being a court of record; and therefore a writ of error lies from hence to the court of king's bench. The laſt court of *juſtice ſeat* of any note was that held in the reign of Charles I. before the earl of Holland. After the Reſtoration another was held, for form ſake, before the earl of Oxford; but ſince the Revolution in 1688, the foreſt laws have fallen into total diſuſe, to the great advantage of the ſubject.

This is the only *juſtice* who may appoint a deputy: he is alſo called *juſtice in eyre of the foreſt*.

JUSTICES *of aſſiſe*, were ſuch as were wont, by ſpecial commiſſion, to be ſent into this or that county, to take aſſiſes, for the eaſe of the ſubjects.

For, whereas theſe actions paſs always by jury, ſo many men might not, without great damage and charge, be brought up to London; and therefore *juſtices*, for this purpoſe, by commiſſions particularly authorized, were ſent down to them.

Theſe continue to paſs the circuit, by two and two, twice every year, through all England, except the four northern counties, where they go only once, diſpatching their ſeveral buſineſſes by ſeveral commiſſions; for they have one commiſſion to take aſſiſes, another to deliver gaols, and another of oyer and terminer. In London and Middleſex a court of general gaol-delivery is held eight times in the year.

All the JUSTICES *of peace* of any county wherein the aſſiſes are held, are bound by law to attend them, or elſe are liable to a fine; in order to return recognizances, &c. and to aſſiſt the judges in ſuch matters as he within their knowledge and juriſdiction, and in which ſome of them have been probably concerned, by way of previous examination. See ASSIZES and JURY.

JUSTICES *in eyre*, *juſticiarii itinerantes*, or *errantes*, were thoſe who were anciently ſent with commiſſion into divers counties, to hear ſuch cauſes, eſpecially as were termed *pleas of the crown*; and that for the eaſe of the ſubject, who muſt elſe have been hurried to the courts of Weſtminſter, if the cauſe were too high for the county courts.

According to ſome, theſe *juſtices* were ſent once in ſeven years; but others will have them to have been ſent oftener. Camden ſays, they were inſtituted in the reign of king Henry II. A. D. 1184; but they appear to be of an older date.

They were ſomewhat like our *juſtices* of aſſiſe at this day; though for authority, and manner of proceeding, very different.

JUSTICES *of gaol-delivery*, thoſe commiſſioned to hear and determine cauſes appertaining to ſuch as for any offence are caſt into priſon.

Juſtices of gaol-delivery are impowered by the common law to proceed upon indictments of felony, treſpaſs, &c. and to order execution or reprieve; and they have power to diſcharge ſuch priſoners as upon their trials ſhall be acquitted; alſo all ſuch againſt whom on proclamation made, no evidence appears to indict; which *juſtices* of oyer and terminer, &c. may not do. 2 Hawk. 24, 25. But theſe *juſtices* have nothing to do with any perſon, not in the cuſtody of the priſon, except in ſome ſpecial caſes; as if ſome of the acomplices to a felony may be in ſuch priſon, and ſome of them out of it, the *juſtices* may receive an appeal againſt thoſe who are out of the priſon, as well as thoſe who are in it; which appeal after the trial of ſuch priſoners, ſhall be removed into B. R. and proceſs iſſue from them againſt the reſt. But if thoſe out of priſon be omitted in the appeal, they can never be put into any other; becauſe there can be but one appeal for one felony.

In this way the gaols are cleared, and all offenders tried, puniſhed, or delivered, in every year.

Their commiſſion is now turned over to the JUSTICES *of aſſiſe*.

JUSTICES *of niſi prius*, are now the ſame with *juſtices of aſſiſe*. It is a common adjournment of a cauſe in the common pleas, to put it off to ſuch a day. *Niſi prius juſticiarii venerint ad eos partes ad capiendas aſſiſas*: from which clauſe of adjournment they are called *juſtices of niſi prius*, as well as *juſtices of aſſiſe*, on account of the writ and actions they have to deal in. See NISI *prius* and JURY.

JUSTICES *of oyer and terminer*, were *juſtices* deputed on ſome ſpecial occaſions to hear and determine particular cauſes.

The commiſſion of oyer and terminer is directed to certain perſons, upon any inſurrection, heinous demeanour, or treſpaſs committed, who muſt firſt enquire, by means of the *grand* JURY or inqueſt, before they are empowered to hear and determine by the help of the *petit* JURY. It was formerly held, that no judge or other lawyer could act in the commiſſion of OYER and TERMINER, or in that of gaol-delivery, within the county where he was born or inhabited; but it was thought proper by 12 Geo. II. cap. 27. to allow any man to be a *juſtice* of oyer and terminer and general gaol-delivery, within any county of England.

JUSTICES *of the peace* are perſons of intereſt and credit, appointed by the king's commiſſion to keep the peace of the county where they live.

Of theſe, ſome, for ſpecial reſpect, are made of the QUORUM, ſo as no buſineſs of importance may be diſ-

patched without the presence, or assent, of them, or one of them. However, every *justice* of peace hath a separate power, and his office is to call before him, examine, issue warrants for apprehending, and commit to prison, all thieves, murderers, wandering rogues; those that hold conspiracies, frays, and almost all delinquents which may occasion the breach of the peace, and after of the subject; to commit to prison such as cannot find bail, and to see them brought forth in due time to trial; and bind over the prosecutors to the assizes. And if by neglect to certify examinations and informations to the next gaol-delivery, or do not bind over prosecutors, they shall be fined. A *justice* may commit a person that does a felony in his own view, without warrant; but if on the information of another, he must make a warrant under hand and seal for that purpose. If complaint and oath be made before a *justice* of goods stolen, and the informer, suspecting that they are in a particular house, shews the cause of his suspicion, the *justice* may grant a warrant to the constable, &c. to search in the place suspected, to seize the goods and person in whose custody they are found, and bring them before him or some other *justice*. The search on these warrants ought to be in the day-time, and doors may be broke open by constables to take the goods. *Justices* of peace may make and persuade an agreement in petty quarrels and breaches of the peace, where the king is not entitled to a fine, though they may not compound offences, or take money for making agreements. A *justice* hath a discretionary power of binding to the good behaviour, and may require a recognizance, with a great penalty, (of [illegible]) for his keeping of the peace, where the party bound is a dangerous person, and likely to break the peace, and do much mischief; and for default of sureties, he may be committed to gaol. But a man giving security for keeping the peace in the king's bench or chancery, may have a *supersedeas* to the *justices* in the country not to take security; and also to giving surety of the peace to any other *justice*. If one make an affray upon a *justice* of peace, he may apprehend the offender, and commit him to gaol, till he finds sureties for the peace; and a *justice* may record a forcible entry on his own possession; in other cases he cannot judge in his own cause. Contempts against *justices* are punishable by indictment and fine at the sessions. *Justices* shall not be regularly punished for any thing done by them in sessions as judges; and if a *justice* be sued for any thing done in his office, he may plead the general issue, and give the special matter in evidence; and if a verdict is given for him, or the plaintiff be nonsuited, he shall have double costs; and such action shall only be laid in the county where the offence was committed. 7 Jac. cap. 5. 21 Jac. cap. 12. But if they are guilty of any misdemeanor in office, information lies against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a *justice*, for any wilful or malicious injury, are entitled to double costs. By 24 Geo. II. cap. 44. no writ shall be sued out against any *justice* of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the suing out of the same, containing the cause of action, &c. within which month he may tender amends; and if the tender be found sufficient, he shall have a verdict, &c. Nor shall any action be brought against a *justice* for any thing done in the execution of his office, unless commenced within six months after the act committed.

A *justice* is to exercise his authority only within the county where he is appointed by his commission, not in any city which is a county of itself, or town corporate, having their proper *justices*, &c. but in other towns and liberties he may. The power and office of *justices* terminate in six months after the demise of the crown, by an express writ of discharge under the great seal, by writ of *supersedeas*, by a new commission, by the accession of the office of sheriff or coroner.

For a further account of the duty of *justices*, see QUARTER *sessions*.

The original of *justices* of the peace is referred to the fourth year of Edward III. They were first called *conservators, or wardens of the peace*, elected by the county, upon a writ directed to the sheriff; but the power of appointing them was transferred by statutes from the people to the king; and under this appellation appointed by 1 Edw. III. cap. 16. Afterwards the Statute of 34 Edw. III. cap. 1. gave them the power of trying felonies, and then they acquired the appellation of *justices*. They are appointed by the king's special commission under the great seal, the form of which was settled by all the judges, A. D. 1590; and the king may appoint as many as he shall think fit in every county in England and Wales, though they are generally made at the discretion of the lord chancellor, by the king's leave. At first the number of *justices* was not above two or three in a county. 18 Edw. III. cap. 2. Then it was provided by 34 Edw. III. cap. 1. that one lord, and three or four of the most worthy men in the county, who have learned in the law, should be made *justices* in every county. The number was afterwards restrained to six, and then to eight, in every county, by 12 Ric. II. cap. 10. and 14 Ric. II. cap. 11. But their number is greatly increased since their first institution. And the above statutes, the statutes just cited direct that the best reputation and most worthy men in the county should be made *justices*. 14 Ric. II. cap. 7. orders them to be men of most sufficient knights, esquires, and gentlemen of the law. And by 2 Hen. V. stat. 1. cap. 4. [illegible] must be resident in their several counties. And by 18 Hen. VI. cap. 11. no *justice* [illegible] tion, if he had not lands to the [illegible]. It is now enacted by 5 Geo. II. cap. 18. that every *justice* shall have 100*l. per annum*, [illegible]; of which he must make oath by [illegible]. And if he acts without such qualification, he forfeits 100*l.* It is also provided by 5 [illegible] ing attorney, solicitor, or practiser [illegible] acting as a *justice* of the peace.

Justices of peace within liberties. [illegible] of the peace who have the same authority [illegible] corporate towns, as the others have [illegible] power in the same; only that they [illegible] and beer, wood and victuals, [illegible] corporations are not within [illegible] Geo. II. cap. 18.

JUSTICE-*seat*. See JUSTICE-*ayre*.

JUSTICIA in *Botany*, a genus of [illegible] *dria* class. Its characters are [illegible] flower has one petal, which is divided into [illegible] bottom, which is entire; the upper [illegible] and the under is reflexed; it [illegible] situated under the upper [illegible] ovary, which becomes an oblong [illegible] which open with an elliptic [illegible] seeds. The ADHATODA, or [illegible] this genus.

JUSTICIAR, in our *Old Law* [illegible] by William the Conqueror, [illegible] and who principally determined [illegible] nal. He was called in Latin, *justiciarius*. See JUSTICE.

JUSTICIARII, in *Church History*, [illegible] given to heretics who held many [illegible], and despise others: such [illegible] the Jews, and the Novatians [illegible] among the Christians.

JUSTICIARIUS, *Magister*, [illegible] of Naples, who has supreme [illegible] tra-son, and pleas of the crown, [illegible] all appeals. He has [illegible] affairs.

JUSTICIARY *court*, in Scotland, [illegible] has supreme jurisdiction in [illegible] in place of that of *justices* [illegible] was left in the person of [illegible] elected for it with king Charles [illegible] general of all the stands; [illegible] between him and some here [illegible] risdiction was taken away in [illegible] tiary erected instead of it, [illegible] ral, absolute at the king's [illegible] over other judges, who are [illegible]. This court commonly sits [illegible] nary clerk, who has his commission [illegible]. They have four ordinary [illegible] by the lords of session.

The form of process is this: [illegible] dictment, by a bill passed [illegible] court, at the instance of the [illegible] or criminal, who is [illegible] after citation. When the [illegible] assize, or jury of forty-five [illegible] pearance being come, fifteen [illegible] to be the assize [illegible]. The assize sits [illegible] nesses examined [illegible] written verbatim [illegible] advocate pleads [illegible] and other advocates [illegible] cluded, the judges [illegible] *relevant*; in which case they [illegible] absolve the party accused: [illegible] *relevant*; in which case the [illegible] moved into a close room, [illegible] sent with them; where they [illegible] and clerk, and consider the [illegible]

bates, and bring in their verdict of the panel found guilty or not guilty. If not guilty, the lords absolve; if guilty, they condemn, and order the sentence of condemnation to be pronounced against the criminal by the mouth of the doomsdier. It has been strenuously maintained by some, and as strenuously controverted by others, that an appeal lies from this court to the house of lords. The lords *justiciary* likewise go circuits twice a year, viz. in May and October, into the country, which is divided into three circuits, the south, west, and north, where assizes are held, and criminals tried, as mentioned above.

JUSTICIES, in *Law*, a writ directed to the sheriff in some special case, by virtue of which he may hold pleas of debt in his county-court for a large sum; whereas otherwise, by his ordinary power, he is limited to sums under forty shillings.

JUSTIFIABLE *homicide*. See HOMICIDE.

JUSTIFICATION, in *Law*, signifies a maintaining or shewing a sufficient reason in court, why the defendant did what he is called to answer. Pleas in *justification* must set forth some special matter; thus, on being sued for a trespass, a person may justify it by proving, that the land is his own freehold; that he entered a house in order to apprehend a felon; or by virtue of a warrant, to levy a forfeiture, or in order to take a distress found in an ASSAULT, that he did it out of necessity.

JUSTIFICATION, or JUSTIFYING, among *Letter Founders*. See *Letter* FOUNDERY.

Among *Printers*, it denotes the proper adjustment of the lines and pages.

JUSTIFICATION, in *Theology*, that act of grace which renders a man just in the sight of God, and worthy of eternal happiness.

The Romanists and Reformed are extremely divided about the doctrine of *justification*; the latter contending for *justification* by faith alone, and the former by works.

JUSTIFYING *bail*, in *Law*. See BAIL *above*.

JUSTIFYING *grace*. See GRACE.

JUSTITIA, *sic*, in *Law*. See FIAT.

JUSTNESS, the exactness or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and sentiments. The *justness* of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject.

Justness of language consists in using proper and well chosen terms; in not saying either too much, or too little.

M. De Mere, who has written on *justness* of mind, distinguishes two kinds of *justness*; the one arising from taste and genius; the other, from good sense, or right reason. There are no certain rules to be laid down for the former, viz. to shew the beauty and exactness in the turn, or choice of a thought; the latter consists in the just relation which things have to one another

JUTTY*heads*, in the *Sea Language*, pitchforms standing on piles, near the docks and projecting without the wharfs for the more convenient docking and undocking ships.

JUTTA, in *Botany*, a name used by some authors for the tree which bears the tamarind of the shops.

JUVENALIA, or JUVENALES *ludi*, games, exercises of body, and combats, instituted by Nero the first time his beard was shaved.

They were celebrated in private houses, and even the women had a share in them: probably they were the same with what were otherwise called *Neronia*.

JUVENTAS, in *Mythology*, the goddess who presided over youth among the Romans. This goddess was long honoured in the Capitol, where Servius Tullius erected her statue. Near the chapel of Minerva there was the altar of *Juventas*, and upon this altar a picture of Proserpine. The Greeks called the goddess of youth HEBE; but it has been generally supposed that this was not the same with the Roman *Juventas*.

IVY, *hedera*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flowers are disposed in form of an umbel; the empalement is cut into five parts, and sits upon the germen; the flower has five oblong petals, and five awl-shaped stamina; the germen, which is situated below the flower, becomes a globular berry without cell, including four large seeds, convex on one side, and angular on the other. There are two species.

While the stalks of the common kind trail either on the ground, or upon walls or other supports, they seldom produce flowers; which has occasioned its being called sterile or barren *ivy*; but when the branches get above their support, or grow from it, they produce flowers at the end of every shoot: these appear in September, and are succeeded by berries, which turn black before they are ripe: these are formed into round bunches, which are called *corymbi*; and from these the epithet *corymbus*, so frequently used by botanists, is taken.

Ivy is a very well known plant; and it is very certain, from all the writings of the ancients, that they, when they wrote with propriety, meant the same plant by the word *kissos* that we do at this time. There is, however, in Pliny a passage which has appeared unintelligible to his commentators, and has puzzled all, and seemed to point out to some other plant than *ivy* to the ancients by the name *kissos*, besides the *ivy*. See CISTUS.

The leaves of *ivy* are seldom used inwardly, but outwardly they are applied to ulcers, to keep them cool, and free from inflammation, as also to scabs, sores, and scald heads. Mr. Boyle, in his *Use of Experimental Philosophy*, commends a large dose of the full ripe berries, as a remedy against the plague; and it is said, that in the London plague, the powder of them was given in vinegar, or white wine, with success; and they have been recommended in small doses, as alexipharmic and sudorific. Schroder says, they purge upward and downward. The gum of *ivy* is somewhat caustic, and commended to take away spots and freckles out of the face. This resinous juice, exuding from the flakes of *ivy*, has been recommended as corroborant and resolvent, in cachexies and uterine obstructions; but has been rarely used, except as an ingredient in plasters; nor does it appear to possess any virtues which common resin has not in an equal degree.

Ivy-resin is brought from Persia, and some other of the hot countries, where alone it is to be found in any considerable quantity. Mr. Ray, indeed, mentions some of it having been found in rocks in Worcestershire, and other authors in other parts of Europe; but these are only singular instances of what may happen, our shops being obliged to be supplied from the East.

The ancient Greeks were acquainted with this resin, which it dealed *lacrima hederæ*, as some also do to this day. It is said to be emollient and detergent, and to make a noble balsam for fresh wounds; but is never used by us with these intentions. The Persians esteem it much as an astringent.

IVY *tree of America*. See KALMIA.

IVY, *ground*. See GROUND-*ivy*.

IVY, *perished*. See PERISHED.

IVY, *wingwarn*. See MOONSEED.

JUXTAPOSITION, is used by philosophers to denote that species of growth, which is performed by the apposition of new matter to the *surface*, or outside, of old.

In which sense, it stands opposed to *intussusception*; where the growth of a body is performed by the reception of a juice within it, diffused through its pores. See NUTRITION.

IXALOS, in *Natural History*, a name given by the Greek writers to the *future*, which we call the *chamois*-GOAT.

IXIA, in *Botany*, a genus of the *triandria monogynia* class. Its characters are these: it has oblong, permanent spathæ, or sheaths, which include the germen; and the flower has six petals, which are equal, and three awl-shaped stamina; it has an oval three-cornered germen, situated below the flower with a single style; the germen afterward becomes an oval capsule with three cells, filled with roundish seeds. It has nine species, natives of the Cape of Good Hope, where the natives greatly esteem the roots as food. Miller.

IXIAS, in *Botany*, a name given to the chamæleon thistle of the white kind; and in the materia medica of the ancients, to a poison, against which they have prescribed many remedies. See CHAMÆLEON.

IXOPUS, in *Botany*, a name given by Cordus, and some other authors, to the chondrilla or succory. Ger. Emac. Ind. 2.

IXORA, in *Botany*, the name of a genus of plants of the *tetrandria monogynia* class, the characters of which are, that the calyx is a small erect perianthium, divided into four segments, and remaining when the flower is fallen; the flower consists of one petal, which is a slender, cylindric, and very long tube, with a flat border, divided into four segments, of an oval figure; the stamina are four very short and crooked filaments, placed in the notches of the flower; the antheræ are oblong; the germen of the pistil is roundish; the style is slender, and of the length of the tube; and the stigma is bifid; the fruit is a roundish berry, containing only one cell, in which are four seeds, convex on one side, and angular on the other.

IYAR, in *Chronology*, the second month of the ecclesiastical Jewish year, answering to part of our April and May.

IYNX. See WRYNECK.

IZTICHUILOTLI, in *Natural History*, the American name of a stone found in New Spain, and some other places; it is very hard, of a beautiful black, and takes a fine

fine polish. The Americans are very fond of it as a gem, and wear it by way of ornament.

De Laet mentions an American stone in his poſſeſſion, which was cut by the Indians into a flat oval plate, and was of a beautiful black, but with two round ſpots of a ſilvery white. He ſuppoſes this to have been the *asbeſtus lapis*, and probably it was only another variety or of the ſpecies hereby mentioned.

IZTICPASO-QUAUHTLI [illegible] *Natural History*, the name given by the natives [illegible] of America to a ſtone famous for its virtues in [illegible] colic, and many other diſeaſes, externally applied. It is of a beautiful green colour, and is by Americans eſteemed a [illegible] cies of emerald, but is more pervious, a very fine [illegible] of

lapis nephriticus, of a pale green colour, very hard, and more pellucid than the other ſpecies of that ſtone, but yet always ſhewing that greaſy look on being poliſhed, which characterizes all the nephritic ſtones. It is uſually found in large maſſes, and the Indians cut it into flat pieces, which they apply to the navel in the colic, and ſuppoſe it has in other diſeaſes, to the part affected, and ſuppoſe it has great power in promoting a diſcharge of the noxious humours.

IZTLI, in *Natural History*, the American name of a ſpecies of ſtone, of which the natives made their weapons of war, &c. before they knew the uſe of iron. It is called by De Laet and other authors, *lapis* NOVACULARUM.
